A. That is correct.

Q. Now, I thought that you had already testified here that this whole project is going to blow up like a balloon in 1947 when this contract expires with the Colorado Interstate Gas Company:

A. I didn't testify that way. I said that I didn't know about it beyond that time.

Q. Since you have had time to think it over, what position are you taking now relative to the—what will happen at the time the contract with the Colorado Interstate Gas Company and Canadian River Gas Company expires in 1947?

Mr. Keffer: If the Examiner please, the exhibit of Mr. Hendee's is a field-wide study. It isn't a study limited to Colorado Interstate Gas Company and Canadian River Gas Company particularly, as it is an estimate of the withdrawals from the field as a whole and not withdrawals by Canadian River Gas Company.

When I say "withdrawals from the field," I mean by all of the operators in the field over this period; applying that, then, to Mr. Thompson's estimate of reserves, it is a very simple calculation to ascertain how long that field will last at that withdrawal. Except to the extent it includes Canadian River's withdrawals—I will state it that way—it has nothing to do specifically with the particular volume of Canadian River wells withdrawals but the aggregate of all of the company's wells in the field.

Mr. Keffer: I think your question there, Mr. March, goes somewhat beyond the exhibit in that respect.

Mr. March: He comes up with one exhibit in which he ends everything in 1947 and now he has an exhibit in which he takes it on up beyond that period. I wanted to know—

Mr. Keffer: I understand what you mean.

Mr. March: —what he considers to be the life of the property; whether it considers the property to be the life of the contract or the life of the field.

Mr. Keffer: I don't see how the life of the contract would have anything to do with the life of the property as such. He may be out of business but still have some gas left.

Mr. Spencer: Mr. Examiner, the point is this: Mr. Hendee is not purporting to show nor is he submitting any estimate of the life of the Canadian River Gas Company's reserves in relation to its market in this exhibit.

Mr. March: I don't think Mr. Hendee will make that statement, Mr. Spencer. I will ask him.

Q. Mr. Hendee, has this anything to do with the life of the Canadian River Gas Company's reserves you have available?

A. This particular exhibit?

Q. Yes.

A. No.

Q. I thought you stated in this exhibit that the Canadian River Gas Company's life as a gas producer and a seller of gas was dependent upon the life of the field.

A. That is true generally, yes.

Q. That is the point and that is why you had to consider the withdrawals from the entire field?

A. Yes.

Q. That instead of considering the Canadian River's withdrawals?

A. Yes.

Mr. Spencer: I guess I didn't go far enough with what I meant. What I meant to say is, it is quite possible Canadian River Gas Company would be out of business in 1947; that the properties would be sold to somebody else and operated by somebody else, but as a project he has not attempted to fix the life of that project in this particular exhibit. It is based entirely on the field, and total withdrawals on that field.

Mr. March: Is there an objection pending?

The Trial Examiner: I don't believe so.

Mr. Spencer: I don't believe there is an objection.

By Mr. March:

Q. You used the words "economic life" here of the field. What do you mean by the word "economic"?

A. Well, that, as Mr. Watson described it, is a point below which it wouldn't be economical to produce or to continue the drilling of wells, and 50 pounds is the point at which it would not be economical for long distance pipe lines to continue taking gas from the field.

Q. I see, Mr. Hendee, that you have been more conservative in this statement than Mr. Watson was in his statement. He stated, as I understand, in his exhibit: "Fifty pounds is the rock pressure at which it will become unprofitable for Canadian River to continue operating and maintaining its gas well from the Texas Panhandle field," and you state in effect it will be unprofitable for it to continue in the use of long distance gas pipe lines.

A. That is correct; that is what I said.

Mr. Spencer: He hasn't said that. Let's read exactly what he said. There is a difference in there.

Mr. March: Let's do that. He states: "The curve which I have plotted indicates that average field pressures

will have reached Mr. Watson's abandonment pressure of 50 pounds and the economic life of the field as a source of supply for major long distance gas pipe lines will terminate by the end of 1956," and Mr. Watson has indicated that when the pressures of 50 pounds are reached by the Canadian River Gas Company that it will be no longer profitable for them to continue operating and maintaining its gas wells in the Texas Panhandle field.

Mr. Spencer: The question that you asked him had particular relation to his statement on Page 3, the first two sentences, in the paragraph commencing on that page.

Mr. March: Page 3 of Mr. Watson exhibit?

Mr. Spencer: No.

Mr. March: I was reading from the last page of the written statement of Mr. Hendee.

Mr. Spencer: I don't want to mix up your cross examination, Mr. March.

Mr. March: He has already answered my questions.

Q. Well, Mr. Hendee, since you have been more conservative than Mr. Watson, what basis have you to make your assertion in effect that the wells will be only available for gas pipe lines?

A. Did you have the word "Canadian" in there?

Q. No.

A. The only thing I studied was the field as a whole and I feel that is true. I am considering major long distance gas pipe lines. There will be production from the field, as Mr. Watson says, after that.

Q. You haven't made any study of the economic abandonment pressure study of the field?

A. No, sir.

Q. You have had to take Mr. Watson's data on that?

A. That is right.

Q. And Mr. Watson says when the Canadian River wells reach 50 pounds it will be no longer profitable to operate at all. What I want to know is why you didn't follow his conclusions there.

A. I consider the Canadian River a major long distance pipe line.

Q. You imply on Page 4 of the statement that the Canadian River Gas Company will be able to utilize the gas locally from these wells?

A. That may be so.

Q. That is very likely, isn't it?

A. Very likely. There will be lots of gas produced after that.

Q. That is very likely.

A. Yes.

Q. There will be lots of gas produced after you get 50 pounds abandonment pressure?

A. Yes.

Q. Do you know of any fields from which that statement can be supported?

A. You mean lots of gas produced below fifty pounds?

Q. Yes.

A. Yes, sir.

Q. Where, for example?

A. Fields in Oklahoma that have gone down to zero pounds but—

Q. Zero pounds?

A. But at considerable expense and trouble.

Q. How did they pull them down to zero pounds?

A. Pardon me?

Q. How did they pull them down to zero pounds?

A. With compressors on a suction.

Q. The company you were formerly with, did it have any such wells?

A. Yes.

Q. Where did they distribute their gas?

A. That was for very very local distribution.

Q. Where does that company have its major outlets?

A. Tulsa and Oklahoma City.

Q. That is as far as they transport the gas?

A. Yes, sir, that is the greatest distance.

Q. How far is the gas from Tulsa?

A. This gas wasn't going into Tulsa.

Q. How far is the field from Tulsa from which you were withdrawing your gas?

Mr. Spencer: You mean by suction?

The Witness: This gas I was talking about didn't go

to Tulsa, Tulsa was drawing its gas—the gas was being drawn 150 to 200 miles from Tulsa.

By Mr. March:

Q. Well, was it all in that same field?

A. No, the Oklahoma Natural Gas Company had about 30 or 35 fields it was drawing gas from.

Q. How far was this field from which the gas was being drawn to zero from Tulsa?

A. The field was about 35 miles from Tulsa.

Q. Where were they delivering their gas?

A. The gas was going right around the town of Claremore. The wells were around the town of Claremore.

Q. And this field from which Tulsa secures its gas is 150 or 200 miles away? What are the pressures in the field?

A. What is that?

Q. What are the pressures in the field from which Tulsa is securing its gas?

A. It was five or six hundred pounds when I left there.

Q. Have you any other citations you can support gas being produced down to zero?

A. No, not directly.

Q. It usually goes below zero?

A. No, a gas field as such doesn't generally go below zero.

Q. Have you ever heard of them going below zero?

A. Pardon me?

Q. Have you ever heard of any gas field having wells pulled down below zero?

A. Dry gas wells—no, I don't think so.

Q. How about sour gas wells?

A. Casinghead gas is drawn below zero. That is for gasoline plants.

The Trial Examiner: Mr. Hendee, did the Oklahoma Natural Gas Company own the distribution system at the town of Claremore?

The Witness: Yes.

The Trial Examiner: And this gas went directly into this distribution system?

The Witness: Yes.

The Trial Examiner: It is still going, in so far as you know?

The Witness: I don't think it is as most of the wells have been pulled down and abandoned.

By Mr. March:

Q. At what pressure were they when they were abandoned?

A. Down to 25 or 30 pounds and various pressures.

Q. You said some of the wells were down to zero?

A. No, they were pulled down to zero by the suction.

Q. Pulled down to zero and they were forced to let the pressures build back up?

A. Yes.

Q. You could still pull them down to zero?

A. Little wells you could.

Q. It is sort of like milking a cow.

A. That is right, the same principle.

* * * * *

Q. Mr. Hendee, when you made inquiries of these natural gas pipe line companies, did you tell them you wanted the information for rate case purposes?

A. I think I did.

Q. First you sent a letter around to them and next you wired them?

A. Yes.

Q. Then did you get some of them on the telephone?

A. No, I don't think I did, except Mr. Dickinson.

Q. Did you call Mr. Dickinson on the telephone for Texoma Natural Gas Company?

A. Yes.

Q. What about the Phillips Petroleum Company? Don't they produce a little gas?

A. They don't have a pipe line out of the field.

Q. They produce some gas, don't they?

A. Yes.

Q. How does its gas production compare with the rest of the gas production in the field?

A. I really don't know because it goes into various outlets.

Q. You really haven't given that any consideration in this study?

A. It is in here, this cumulative curve.

Q. How did you get it in there when you didn't know about it?

A. I know it is in there because all of the figures are in there.

Q. How do you know the future figures are in the curve when you say you didn't get the future figures from the Phillips Petroleum Company?

A. They are in here in one of the companies' takes or the gasoline figures, so they are continued into the future the same way.

Q. Did you send a letter of solicitation to the Phillips Petroleum Company?

A. No, I didn't.

Q. Why didn't you?

A. I wasn't interested in them particularly as I was interested in the actual take from that field.

Q. You were equally interested in withdrawals from the field?

A. That is true.

Q. Don't you know these other companies take more gas from the field than the pipe line companies?

A. Yes, and they are in here.

Q. You didn't attempt to get any information at all from the Phillips Petroleum Company?

A. No, sir.

* * * * *

Q. Did you ever see that proration schedule of the Canadian River Gas Company before, Exhibit No. 32?

A. I can't identify this exhibit as the exact one.

Q. Do you know this man W. C. Doughty?

A. Yes, sir.

Q. Is he one of your employes?

A. Yes, sir.

Q. Now, are you familiar with the proration schedule of the Canadian River Gas Company?

A. Yes.

Q. Was that a schedule which was just made up by the company itself voluntarily?

A. Yes, that's right.

Q. Was there any written contracts between the lessors and the company approving the proration schedules?

A. No, not that I know of.

Q. Is the schedule subject to change at any time without any notice to the lessors?

A. Yes.

The Trial Examiner: Hasn't Mr. Watson testified as to all of that, Mr. March?

Mr. March: Not clearly. It's not clear. I want to be sure about it. It's not clear. It is now, though.

Now, just one other question:

Q. Is this the first proration schedule the company has ever invoked?

A. This particular one?

Q. Yes.

A. Oh, no. That schedule is changed from time to time.

Q. When was the last time you changed it?

A. It might change from month to month.

Q. It might change from day to day?

A. Yes.

Redirect Examination.

By Mr. Keffer:

Q. You say it is changing from time to time. You are speaking of wells drilled, for example, on acreage that had not therefore been under production?

A. That's right. When a new well is drilled it increases the proven operated acreage under that particular lease and that changes the schedule.

Q. You stated also, Mr. Hendee, that there was no contracts of land owners approving that schedule. You do have certain contracts, such as the Bivins A Consolidated lease, which provides for methods of allocating production to that land?

A. That's true.

Q. And some others in your consolidation lease forms?

A. That's true.

Testimony of J. G. Dickinson, Witness for Commission.

J. G. Dickinson, witness for the Commission, stated that he was General Superintendent of Production for Tex-

oma Natural Gas Company; that he had no connection in any way with Canadian. (Vol. LXIV, pp. 9197-9198.) That all of the gas for the Natural Gas Pipe Line Company of America is furnished from the acreage of Canadian and Texoma Natural Gas Company. (Vol. LXIV, pp. 9202-9203.)

Dickinson testified on cross-examination that his duties as General Superintendent of Texoma Natural Gas Company consisted of supervision of the activities of the geologist, land, lease and production departments, which covers practically all of the field operations of the company and that he had held this position since 1930. (Vol. LXIV, p. 9228.)

The witness testified on redirect examination that it was his opinion that the entire life of the reserves of both Canadian and Texoma Natural Gas Company was approximately twelve years from January 1, 1940, and that his company relied upon this estimate as to the life of the reserves and that this assumed that there would be no pipe line property in service by the end of 1952. (Vol. LXIV, p. 9232.)

J. G. DICKINSON further testified on cross examination (Vol. 64, pp. 9197-9208; 9213-9216; 9218-9226) as follows:

J. G. DICKINSON called as a witness by and on behalf of the Federal Power Commission, being first duly sworn, was examined and testified as follows:

Direct Examination.

By Mr. March:

Q. Please state your name.

A. J. G. Dickinson.

Q. What business are you engaged in?

A. I am General Superintendent of production for Texoma Natural Gas Company.

Q. Are you the same Mr. Dickinson that has been sitting in the court room here the last three or four days?

A. I believe so.

Q. Are you in any way connected with Canadian River Gas Company?

A. No, sir.

Q. Your business here is solely that of an observer?
A. That is right.
Q. Mr. Dickinson, I hand you a copy of a letter here signed by you, addressed to Mr. Robert W. Hendee, dated November 18, 1940, which purports to give the requirements of the Texoma Natural Gas Company on the Canadian River Gas Company for the future. Does that look like the letter you wrote?
A. Yes, I think so.
Q. Are the figures—is that the way you had them?
A. I don't recall the figures but—
Q. Will you state briefly what that shows?
A. This is a designation of quantities of gas which Natural Gas Pipeline Company would require from Canadian River Gas Company to supply markets which would be served by certain extensions which were contemplated.
Q. You say that certain extensions of the Natural Gas Pipeline facilities were contemplated?
A. Yes.
Q. With what certainty do you know that you will require this gas in the future as you have indicated here in this letter from the Canadian River Gas Company?
A. I don't believe I am in a position to testify as to that. Maybe I could best explain this letter by saying that I was advised by Mr. Floyd C. Brown who is vice president and general manger of our company—
Q. Which company is that?
A. The Texoma Natural Gas Company and Natural Gas Pipeline Company.

—that Texoma would be required to furnish certain quantities of gas for additional markets and at the same time he requested that I advise Mr. Hendee that additional quanities would be required from the Canadian River Gas Company—from the Colorado Interstate Gas Company instead of Canadian River Gas Company.

Q. What is Mr. Brown's position? Is he your superior?
A. Yes.
Q. You work under his immediate supervision?
A. No, I work under Mr. Kesinger's immediate supervision.
Q. Who is he?
A. He is general superintendent.

Q. Kesinger works under Mr. Brown's supervision?

A. Yes.

Q. Let's see. You say that you furnished this estimate of future requirements because Mr. Brown told you to?

A. No, I believe it would be more accurate to say that Mr. Hendee asked me to furnish him with the requirements from Colorado Interstate as far as Natural Gas Pipeline Company was concerned, and I requested the information of Mr. Brown.

Q. Well, you asked Mr. Brown to tell you just exactly what the requirements of Texoma Natural Gas Company and Natural Gas Pipeline Company of America would be upon Canadian River Gas Company, is that right?

A. Yes.

Q. So he furnished you with this information in this letter?

A. That's right.

Q. Well, how do you know that these will be the requirements?

A. Well, I am depending upon Mr. Brown's judgment in that matter.

Q. You state here in this letter:

"Confirming my telephonic conversation with you yesterday the following tabulation represents the increased quantities of gas to be furnished pipe line to Chicago and Milwaukee by Canadian River Gas Company."

Now, Mr. Dickinson, do you know whether or not Canadian River Gas Company will be required to furnish the amounts of gas indicated here in this estimate?

A. It is my judgment that they will be, based on the acquirement of knowledge as I outlined just previously.

Q. Then it is not solely the information which you got from Mr. Brown?

A. Not entirely.

Q. If you wrote this letter and state that that is how much gas you are going to require, you merely are relying upon what Mr. Brown said, or did you have some knowledge as to the correctness of these figures yourself?

A. Oh, no, I have no knowledge of the figures outside of the information I got from Mr. Brown.

Q. Did you get all of this information from Mr. Brown, every bit of it?

A. Yes.

Q. So, therefore, you don't know whether or not they are going to need these increased quantities of gas indicated in this letter or not, of your own knowledge—the Texoma Natural Gas Company and the Natural Gas Pipeline Company of America?

A. No, I haven't made a study of market requirements.

Q. As far as you know, they may not need any of it?

A. Oh, I wouldn't say that. I have confidence in Mr. Brown's judgment. I would believe they would probably need all of it.

Q. Let's see how Mr. Brown formulates this judgment. You are the superintendent in charge of production of Texoma Natural Gas Company, is that correct?

A. That's right.

Q. And Texoma Natural Gas Company—what is the relation between Texoma Natural Gas Company and Natural Gas Pipeline Company of America?

A. They are affiliated companies.

Q. They are controlled by identical interests, aren't they?

A. Not exactly.

Q. What is the difference? Wherein are they not controlled by identical interests?

A. Well, I believe that Standard of New Jersey, which does have an interest in Natural Gas Pipeline Company, does not have an interest in Texoma.

Q. That is the only difference in the relationships?

A. I think so.

Q. Are they operated as substantially a single business enterprise?

A. Yes.

Q. Now, when Mr. Brown wants to know whether or not he is going to have to go to some source—strike that, will you?

All of the gas of Natural Gas Pipeline Company of America is furnished by the Texoma Natural Gas Company and the Canadian River Gas Company, is it not?

A. Yes. That is, it is furnished through Colorado Interstate from Canadian River acreage.

Q. Yes.

A. And Texoma acreage.

Q. Those are the only two sources of supply for the Chicago line?

A. Yes.

Q. Well, now, when Mr. Brown wants to know as to whether or not all of that gas could be supplied by you or not, he would have to ask you as production superintendent, would he not?

A. Yes, I think he would ask me.

Q. Well, did he?

A. Yes, I had a conference with Mr. Brown in Chicago in which we discussed the future requirements from Texoma acreage.

Q. What sort of a report did you make to him?

A. I told him that we had ample reserves in the Panhandle field to supply the additional requirements from Texoma over a considerable number of years.

Q. How many years?

A. I don't recall.

Q. Approximately, how many years?

A. I don't remember that, Mr. March.

Q. Would it be fifty years or twenty years?

A. No.

Q. Would it be twenty years?

A. I don't remember.

Q. Would it be five years? You have some idea, now, don't you, Mr. Dickinson? What did you mean by a large number of years? What did you have in mind when you said "large number of years"?

A. I think it would be best to express it this way, that on account of the drainage condition in the Panhandle field the life of Texoma leases is limited by the life of the field and Texoma has more reserves than is required for its load and that we could furnish additional gas for the extra markets in addition to our present setup, present requirements.

Q. For a good many years?

A. Yes.

Q. About how many years?

A. Well, I told you I didn't remember.

Q. Well, you have some idea, now Mr. Dickinson, now, don't you? Just give us approximately.

A. Well, as I remember it was in the neighborhood of ten years, more or less. I don't remember exactly.

Q. Approximately ten years, you thought, that the Texoma Natural Gas Company had sufficient reserves to fur-

nish their present requirements for approximately ten years, is that right?

A. I think so, more or less. I don't remember exactly there.

Q. This drainage thing, I didn't ask anything about drainage—

Mr. Spencer: He's your witness.

By Mr. March:

Q. What do you know about drainage? Are you a geologist?

A. No.

Q. You don't know anything about drainage, then, do you?

A. I made quite a study of the conditions in the Panhandle field.

Q. Are you responsible for the testimony in the Texoma case that the Texoma Natural Gas Company was losing sixty per cent of their gas by means of drainage?

A. I believe Mr. Peterson testified to that.

Q. Do you think they are losing that much?

A. Yes.

Q. All right, you told Mr.— you wouldn't know the per cent of drainage since you aren't a geologist, would you?

A. No, I have no knowledge as to the percentage I didn't make that study.

Q. So you had this conference with Mr. Brown and you told Mr. Brown that you had reserves to take care of the present requirements, you thought, for a period of ten years, and what else did you tell him? That doesn't get down to these figures yet.

A. I think that is all. I told him I thought we had sufficient reserves to supply those requirements for ten years, more or less. I don't remember the exact period.

Q. All right, then, did he ask you—

A. That is, for our 75 per cent of the pipe line requirements. The other 25 per cent is furnished by Canadian River.

Q. You in effect told him that if they wanted to take care of the Milwaukee market or these extensions, whatever they were, they would have to go some place else to get the gas, is that right, in effect?

A. No, I didn't tell him that. He didn't ask me about that.

Q. Did you indicate to him as to how much you would have to get from Canadian River?

A. No, I assumed that the quantities required through Canadian River would automatically be supplied under the contract.

Q. So you didn't give him any figures at all as to just exactly the requirements that would have to come from Canadian River?

A. No, he gave them to me.

Q. Of course, he had this conference with you first and then he turns around and gives the figures to you?

A. No, I think you misunderstood. This conference took place some time before he gave me these figures here. We had some discussion of approximate quantities, but these definite estimates of quantities were not arrived at until some time later.

Q. Oh, you say you did have some discussion, then, on quantities, that Canadian River would have to supply?

A. No, our discussion of quantities dealt with Texoma to start with.

Q. Yes.

A. And then later I made a request for quantities which both Texoma and Canadian River should furnish and then supplied those to Mr. Hendee.

Q. Yes, you were getting those figures, of course, from Mr. Brown?

A. That's right.

Q. Mr. Dickinson, when you speak of the additional requirements to be caused by circumstances beyond the present markets of Natural Gas Pipeline Company, what do you mean by that?

A. Why, principally a proposed extension into Wisconsin and Milwaukee area.

Q. The Milwaukee area?

A. Yes.

Q. Is there a pipe line running from—I believe you stated that it is just a proposed extension to the Milwaukee area, is that correct?

A. That is right. A pipe line has been built to the Wis-

consin line and right of ways have been bought on into the Milwaukee area.

* * * * *

Q. Well, your knowledge of Natural Gas Pipeline's line to Chicago is not superficial, is it?

A. I have general knowledge of that situation.

Q. Do you know whether or not you could deliver the gas in any additional requirements over that line without building a new line?

A. Yes, I am sure we could not deliver any substantial additional quantities.

Q. Without building a new line paralleling the line?

A. Without making some extensions of our pipe line system, yes.

Q. Well, by extension of the pipe line system, of course—

A. Either building a parallel line or looping the present line to some extent.

Q. Well, if your estimates are correct here you couldn't deliver all the gas that you have ultimately to deliver here without paralleling the line, could you?

A. That is true, and we have already bought rights of way to loop this line and have taken option on the station site for a new compressing station in Moore County and bought a right of way from Moore County up to the Gray County station in Oklahoma.

Q. The Gray County station is your principal compressor station?

A. No, it is the second compressor station after you leave the Panhandle field.

Q. Now, you say that your company has two sources of supply, the Canadian River Gas Company and the Texoma Natural Gas Company, both of which are located in the Panhandle field of Texas?

A. Yes.

Q. How much of the requirements do you expect to get from the Hugoton field?

Mr. Spencer: Excuse me. By "these requirements," do you mean during the period named on that letter?

Mr. March: Yes. I want to know what requirements he is going to get from the Hugoton field.

Q. I am interested to know whether or not it might be

possible to get all the gas they want to get from Canadian River from the Hugoton field. What arrangements have been made to get gas from the Hugoton field, Mr. Dickinson?

A. Well, during the period covered by this letter there have not been any arrangements made.

Q. What period is covered by this letter—to 1946?.

A. Yes.

Q. Mr. Dickinson, do you know whether or not your company has made any arrangements to get any gas from the Hugoton field to take care of its requirements to Milwaukee, or other requirements?

A. No definite arrangements, yet.

Q. There is negotiations being carried on, though?

A. No, it has not reached that stage yet, I don't think.

Q. You know very positively that no negotiations are being carried on or arrangements made with regard to getting gas from the Hugoton field?

A. Oh, I think there has been a lot of conversation, but I don't know whether you would characterize them as negotiations or not.

Q. Have you been making those preliminary conversations and have you been in charge of them?

A. Oh, I have been making some of them.

Q. Where is the Hugoton field in relation to the Texas Panhandle field? How many miles north?

A. I don't remember. Those fields are quite large.

Q. How far is the nearest producing well in the Hugoton field from the nearest producing well in the Panhandle field?

* * * * *

Q. Do you know the answer to my question as to the distance?

A. No, I can't tell you without referring to a map. I don't remember that.

Q. Would you say it was fifty miles—less than fifty miles?

A. I think that from the edge of one field to the edge of another that fifty miles might be all right.

Q. It would be less than that, wouldn't it?

A. I don't remember.

Q. Where is the Hugoton field in relation to your pipe line?

A. It is west of it.

Q. Approximately how far?

A. Oh, forty or fifty miles. I don't remember that distance very well either. That's kind of a hard question to answer, too, because these eastern limits of the field aren't definitely delimited and it is rather irregular. I don't remember that.

Q. How far is your pipe line, approximately, from the nearest producing well in the Hugoton field?

A. I don't know.

Q. Do you know approximately?

A. Yes, it is somewhere around 40 miles, I should say.

Q. It is not over that, is it?

A. I don't think so.

Q. It is less than that?

A. It could be.

Q. How much acreage does your company own in the Hugoton field?

A. Not any.

Q. How much acreage do the companies controlling your company own in the Hugoton field?

A. I don't remember.

Mr. Spencer: Now, again, Mr. Examiner, why is it necessary to go into this as far as any issues involved in our case here?

The Trial Examiner: That's just the point, Mr. March. You said a while ago that you wanted to establish a certain thing and now you are going way beyond that.

Mr. March: No, I want to try to establish here that they can get their requirements from the Hugoton field and wouldn't have to have the requirements from the Canadian River Gas Company.

Mr. Spencer: Why, Mr. March, we could get them from Oklahoma City or Oklahoma or any other field or from Louisiana. Is that a part of the issues in this case?

Mr. March: It makes a lot of difference in the money spent here in the well drilling program and what-not.

The Trial Examiner: Well, it seems to me, Mr. March,

that that is wholly a matter of conjecture of what they might do or what they might not do here.

Mr. March: That's the whole thing. These estimates here are a matter of pure guess.

Mr. Spencer: Why don't you let it go at that, then?

Mr. March: I just want to establish clearly that they are, if I can. If I can't I want the record to clearly show.

Then the Examiner thinks I shouldn't ask any more questions in regard to the Hugoton field in relation to this pipe line?

The Trial Examiner: I don't see how, Mr. March, or I don't see why for the purpose of this proceeding.

Mr. March: I would like to ask one more question:

If the companies controlling Texoma Natural Gas Company and Natural Gas Pipeline Company of America own substantial acreage in the Hugoton field.

Mr. Spencer: That is the same question and I object to it again.

The Trial Examiner: Well, if this witness knows he may state.

By Mr. March:

Q. Mr. Dickinson, do you know as to whether or not the companies which control your company own substantial acreage in the Hugoton field of Kansas?

A. Yes, they do.

Q. Then in conclusion I just want to ask you a couple of questions so that I can get into the record exactly the nature of these requirements which you say Texoma will require of Canadian River. So far as you know of your own knowledge they may not need any gas which is recorded here in this future estimate—your company may not need any of the gas, is that right?

A. No, I wouldn't want to make a statement of that kind. I think I would be willing to say that it is my judgment that they would need these figures.

Q. It is your judgment now that they would need these figures?

A. Yes.

Q. That they would have these requirements?

A. And I am perfectly willing to agree that they are based on Mr. Brown's—based on information which Mr. Brown gave me. Now, that is the extent of my knowledge. I am willing to qualify it to that extent.

Q. That's right. All you know as to these requirements is what Mr. Brown told you?

A. That's right.

Q. And of your own knowledge you don't know whether or not your company will require this gas or not, other than what Mr. Brown tells you?

A. My knowledge has been enhanced by the information which I got from Mr. Brown.

Q. And that is the only enhancement that you have got?

A. That is correct.

Q. Therefore, I want you to answer my question if you can: Of your own knowledge, you don't know whether your company will need any of this gas for the Milwaukee market?

A. I think I have answered the question.

Q. Will you answer that question directly so I can have it in the record yes or no? You can refuse to answer it.

A. I think that I am reasonably—I have confidence in Mr. Brown's estimate here. I think these are the quantities that will be required, and my knowledge is limited by the information furnished me by Mr. Brown.

Mr. March: Read the question to him there. I want to get a little more definite answer on that.

(The question referred to was read by the reporter, as set forth above.)

Mr. Spencer: Now, Mr. Examiner, he is coercing his own witness here. That's a very bad practice.

Mr. March: Sometimes I think that this witness is not my witness but it is Mr. Spencer's witness. He has been over on that side of the table all week.

Mr Spencer: I think he has answered your question.

The Witness: I think I have answered the question.

Mr. March: I would rather have you answer the question directly if you can, yes or no.

The Witness: I would rather not answer the question that way.

Mr. March: That's all I want you to say.

Mr. Spencer: You are perfectly willing to answer it the way you have answered it?

The Witness: Yes.

By Mr. March:

Q. Mr. Dickinson, has your company made any estimate of the reserves of the Panhandle field of Texas?

A. Yes, Mr. Peterson has made an estimate of that.

Q. Anyone else for your company?

Mr. Spencer: Now, Mr. Examiner, I am willing to let him go, but we'll get involved in something that—

Mr. March: I am not going to get involved. I have just got two or three questions.

The Trial Examiner: Try and cut this short.

Mr. Spencer: What difference does it make?

Mr. March: It makes a great deal of difference.

The Trial Examiner: Mr. March, did you ever make an estimate—Mr. Dickinson?

The Witness: No.

Mr. March: Is that as short as you want it, Mr. Examiner?

The Trial Examiner: That's as short as I want it.

Mr. March: It is not as short as I want it, but if the Examiner rules I won't—

The Witness: I have never made an estimate of reserves, if that's what you meant.

The Trial Examiner: That's what I meant.

By Mr. March:

Q. Has your company made an estimate of the reserves outside of the estimate of reserves made by Mr. Peterson?

Mr. Spencer: The company doesn't make an estimate of reserves.

By Mr. March:

Q. Have you employed anyone else to make an estimate of reserves for you?

A. Yes, we have.

Q. Who were those?

A. J. D. Thompson, Jr. and Mr. C. Don Hughes.

Q. The same individuals that have been here in this hearing room all week?

A. Well, I don't remember whether they have been here—

Mr. Spencer: They really haven't been here all the time.

The Witness: I don't think some of them have.

By Mr. March:

Q. What is Mr. Peterson's connection with your company?

A. Chief geologist for the Texoma Natural Gas Company.

Q. He is employed by your company?

A. Yes.

Drainage in Texas Panhandle Field.

Testimony of C. H. DUNLAP, Witness for Canadian.

C. H. Dunlap identified a series of pressure contour maps each titled "Rock Pressure Contour Map, Texas Panhandle Gas Field," which series of maps was marked for identification as Exhibit 239 and was later received in evidence. The witness' testimony concerning these maps is shown in Volume LXXXI, pages 11926 to 11942. The maps show pressure conditions in the Texas Panhandle Field for the years 1933, 1934, 1935, 1936, 1937, 1938, 1939 and 1940. The first map of the series which is dated 1925, shows the general outline of the field, all of which is colored in yellow, and shows the field in its original virgin pressure condition.

The 1933 and 1934 maps are based upon the pressure contour (isobar) maps prepared by C. J. Peterson, which maps were subsequently identified by Peterson, Volume LXXXII, pages 12275 to 12286.

The maps from 1935 to 1940, inclusive, are based upon

the pressure contour (isobar) maps prepared by the Railroad Commission.

The different colors on the maps represent different pressure bands, each color representing a 50-pound pressure band. There are seven colors in all, starting with pressures from zero to 150 pounds and going up to pressures above 400 pounds. The red color, as shown on the 1940 map, represents the area in which the pressures are lower than 150 pounds; the gray color, which is the next higher band, represents pressures from 150 to 200 pounds; the orange color, which is the next higher band, represents pressures from 200 to 250 pounds; the green color, which is the next higher band, represents pressures from 250 to 300 pounds; the blue color, which is the next higher band, represents pressures from 300 to 350 pounds; the brown color, which is the next higher band, represents pressures from 350 to 400 pounds, and the yellow color, which is the highest band, represents pressures above 400 pounds, as based upon the pressure survey made by the Railroad Commission in mid-summer, 1940. These colors represent the same pressure bands on the entire series of maps. It will be noted that the red color does not appear at all on the 1933 map. This is due to the fact that there were no pressures below 150 pounds that year. The red color shows up for the first time in a small area in Gray County on the 1934 map and is shown again in the area around Borger on the 1935 map.

Each map contains other data in the upper righthand corner, being average weighted rock pressures and withdrawals of gas. This portion of the maps was not received in evidence.

Dunlap had been preparing these maps over a period of years and they were not prepared for this particular hearing.

The witness testified on cross-examination that he was a draftsman and that the maps were as exact a duplication of the Railroad Commission's maps as he could make them.

C. H. DUNLAP further testified on cross examination (Vol. 81, pp. 11926-11936) as follows:

C. H. DUNLAP, called as a witness by and on behalf of the respondents, being first duly sworn, was examined and testified as follows:

Direct Examination.

By Mr. Keffer:

Q. Your name is C. H. Dunlap?

A. Yes, sir.

Q. You live in Amarillo, Texas, Mr. Dunlap?

A. Yes, sir.

Q. I hand you a series of maps, Mr. Dunlap, and I will ask you if those maps have been prepared by you and under your direction.

A. Yes, sir.

Mr. Keffer: I will ask, Mr. Examiner, that the series of maps be given an exhibit number for identification.

The Trial Examiner: Very well, Mr. Keffer. Is there any particular title for that map?

Mr. Keffer: It is a series of maps entitled "Rock Pressure Contour Map, Texas Panhandle Gas Field."

The Trial Examiner: It will be marked for identification as Exhibit No. 239.

(Exhibit 239, Witness Dunlap, marked for identification.)

By Mr. Keffer:

Q. Mr. Dunlap, referring to the rock pressure contour map of the Panhandle field which has been marked as Exhibit No. 239, I will ask you if that series of maps represents the Texas Panhandle gas field?

A. Well, so far as I know, yes.

Q. All right. Now, the first map at the top colored all in yellow, that is the outline of the Texas Panhandle gas field as it was before any depletion occurred?

A. Yes.

Q. And beginning with 1933 and covering 1934, 1935, 1936, 1937, 1938, 1939 and 1940, you have shown the same

outline of the field and have also shown pressure contours for those years, have you not?

A. Yes, sir.

Q. Take the map for 1933 and 1934. What is that based upon as far as the pressure contours are concerned?

A. Well, those maps were made by me when I worked for the Texoma Natural Gas Company under Mr. C. J. Peterson.

Q. The maps beginning with 1935 through to 1940, inclusive, with respect to pressure contours shown upon those, what is that based upon?

A. Copies of the Railroad Commission's maps.

Q. And are representative of the Railroad Commission's maps which show the pressure contour bands in the Texas Panhandle gas field?

A. Yes, sir.

Q. And shows the field as outlined by the Railroad Commission for those years?

A. Yes, sir.

Q. Now, those pressure bands represent 50 pounds differentials in pressure, do they not?

A. Yes, sir.

Q. You have how many colors? You might take the 1940 map as being illustrative.

A. One, two, three, four, five, six, seven.

Q. It starts with pressures below 150 and runs to pressures above 490, is that not correct?

A. That is correct.

Q. The red color represents pressures below 150 pounds, does it not?

A. Yes, sir.

Q. What would you call the next—a slate color?

A. A gray color.

Q. That represents pressures between 150 and 200 pounds?

A. Yes.

Q. What is the next color?

A. Orange.

Q. Orange represents pressures from 200 to 250 pounds?

A. That is right.

Q. The green represents 250 to 300 pounds?

A. Yes.

Q. And the blue represents pressures from 300 to 350 pounds?

A. That is right.

Q. And the brown from 350 pounds to 400 pounds?

A. That is right.

Q. And the yellow represents pressures above 400 pounds.

A. That is right.

Q. Now, what experience have you had in draftsmanship, Mr. Dunlap?

A. Well about fourteen years?

Q. Did you give a considerable part of your time to work of this character?

A. Practically all of it.

Q. Now, there is also shown on the map certain weighted average rock pressures. Was that taken from the Railroad Commission's records?

A. I think it was. I didn't get these figures myself but I think they are Commission's figures.

Q. All right. It also shows total withdrawal figures on a 14.65 base. Those figures as I understand it were furnished by Mr. McCue of the Columbian Carbon Company?

A. That is right.

Mr. March: Now, I object to leading the witness too much.

Mr. Keffer: It is such a simple matter, Mr. Examiner—

The Trial Examiner: It is not at all harmful, Mr. March.

Mr. Keffer: I am going to make just a statement in this connection with respect to those pressures and with respect to the withdrawal figures which were furnishind by Mr. McCue. If Commission's counsel have any objection to those going in, we will not offer them. I have no objection to it going in or not going in, it is entirely up to Mr. Lange and Mr. March.

Mr. March: I want to see the working papers immediately on these maps.

Mr. Keffer: What do you mean?

Mr. March: I don't want to waste three or four days. I want to see them right now.

Mr. Keffer: Why, the working papers are simply the maps of the Commission, Mr. March, which you have in the Commission reports, and just about the same scale that this is. Will not that suffice? There isn't any working papers except that this is a reproduction of the map. That's all there is to it.

Mr. March: I'll ask the witness a couple of questions.

By Mr. Keffer:

Q. You have been making these maps over a number of years, have you not, Mr. Dunlap?

A. Yes.

Q. And they have not been prepared for this case?

A. No.

Mr. Keffer: All right, Mr. March, that's all.

Cross Examination.

By Mr. March:

Q. You are just a draftsman?

A. That's right.

Q. And all you know is what somebody told you to put on these sheets?

A. That's right. I just copied the Commission maps.

Q. These are identical with the Commission maps?

A. As far as I could say, yes, sir. You see the Commission map is a large scale map. This has been reduced to approximately ten miles per square inch and as far as I could say, they are correct.

Q. There is a great deal of inaccuracy in here, isn't there, if you reduced them that much?

A. Well, it depends upon what you call inaccuracy. If you were to scale it off you might find a few pounds difference.

Q. Under whose direction did you prepare these maps?

A. These maps were prepared more or less just as a picture. They weren't prepared for this case.

Q. Under whose direction?

A. Under my direction.

Q. Under your direction?

A. Yes.

Q. Who gave you orders to prepare the map?

A. I made those for the Panhandle Eastern.

Q. Under whose supervision?

A. Mine.

Q. Do I understand this isn't more nor less than a copy of the Railroad Commission maps?

A. Yes.

Q. Up to what year?

A. 1940.

Q. How far did you go—you mean the 1933 map is a Commission map?

A. The 1933 and 1934 maps were Texoma's.

Q. Who gave you those?

A. Mr. Peterson. I worked for him at the time.

Q. You prepared these two under the direction of Mr. Peterson, this 1933 and 1934 map?

A. Yes, sir. Now, let me ask a question. Are you asking about this map or the originals?

Q. I am trying to find out under whose direction you prepared these maps—all of them.

A. These, I say, I prepared for Mr. Field. It was his idea. I did all the work. In other words, he is just a representative of the Panhandle Eastern in Amarillo and he wanted a map made and everything was my work.

Q. By whom are you employed now?

A. Hagy, Harrington & March.

Q. Now, let's see, is there any other data on here that was not taken from the Railroad Commission maps correctly?

A. Well, now, as I say—you mean on the contours, the map itself, or the figures.

Q. I mean any data on the face of these maps. You enumerate it and designate what has not been taken from the Commission maps.

A. Well, the maps from 1935 on were from the Commission direct. The figures, as Mr. Keffer told you, were from H. W. McCue. I think that he got them from the Commission, but I won't—

Mr. March: Mr. Keffer, I think we can talk about this off the record and see what working papers there are, and we would object to anything going in here that you don't have a witness to support.

Mr. Keffer: That's all right. Mr. Lange and Mr. March you have all of the Railroad Commission reports since 1935, and Mr. Examiner, those reports do show maps on the same pressure contour bands and they can very readily be checked.

Mr. March: I have some of them but they are in Washington, but I want to see your working papers on this.

Mr. Keffer: You seem to have a different conception of what a working paper is at times than what I have.

Mr. March: Those new maps aren't Railroad Commission maps.

Mr. Keffer: They were worked out by Mr. Dunlap.

Mr. March: All right, I want to see the basic data Mr. Peterson had in constructing those maps. I don't want to see it today but I don't want to wait two or three days.

Mr. Keffer: I don't know that they are here, Mr. March. If this witness says that these are a reproduction of those Commission maps, I fail to see how having the original maps here would add anything to it. The witness is under oath and he has stated that he has accurately reproduced them.

Mr. March: Yes, but I don't even know where Mr. Peterson got the maps.

Mr. Keffer: He made them up from the pressures existing in the field at that time. The basic data, of course, are pressures existing at those periods.

Mr. March: I am requesting those working papers.

The Trial Examiner: I think we might shorten this up, Mr. Keffer. Do you wish to offer the exhibit?

Mr. Keffer: Yes.

Mr. March: I object to it without having had an opportunity to look at the working papers.

The Trial Examiner: You have cross examined him, Mr. March.

Mr. March: I haven't cross examined him, Mr. Examiner. Here are two maps in here. He is just a draftsman. I

don't know where Mr. Peterson got the data on the 1933 and 1934 maps. They aren't Railroad Commission maps.

The Trial Examiner: So far as I am concerned, he has laid a proper foundation for the map. You may state your objection.

Mr. March: I want to cross examine the witness. If you are going to let these things go in without cross examination, we object to that.

The Trial Examiner: You have been afforded an opportunity to cross examine the witness on these maps.

Mr. March: Well, I'll cross examine him right now on them.

Q. I will show you the map for 1933 and I will ask you, do you know whether that is an accurate reproduction of the pressure contours in 1933?

A. As Mr. Peterson contoured them, yes, sir.

Q. I want to know if you know of your own knowledge.

A. As you said, I am just a draftsman. I am no engineer. I can't say that the pressures are correct or anything else.

Q. In other words, they might be something different as far as you know?

A. As far as I know, the map is correct.

Q. You have no idea what the pressure contours were as of 1933, do you?

A. Just how do you mean?

Q. I mean from an engineering standpoint, you didn't construct the map?

A. No, I did not.

Q. In 1934—I show you the pressure contour map for that year and I will ask you if you constructed it and the data was compiled by you.

A. I did not.

Q. I will ask you, have you any knowledge as to what the pressure contours were as of 1934.

A. I do not.

Q. You just took the information Mr. Peterson gave you?

A. That's right.

Testimony of J. B. Massa, Witness for Canadian.

Qualifications

He is thirty-nine years of age; resides at Pampa, Texas. He is a registered petroleum engineer "Natural Gas" State of Texas, and is now engaged in a consulting practice.

He has been engaged in the oil and gas business since 1920. His business experience has been as follows: (Vol. LXXXVI, pp. 13049-13051, Exhibit 256, p. 1.)

> Tide-Mex Oil Company, Zacamixtle, Vera Cruz, Mexico, 1920-1922. Engineering Department, doing surveying and construction work and oil production and transportation.
>
> Wooten Hughes Company, Ranger, Texas, 1923-1924, Natural Gasoline Plant Construction plant operation, gas measurement and testing and plant efficiency work.
>
> Phillips Petroleum Company, Ranger, Texas; Borger, Texas, and Pampa, Texas, 1925-1929; plant efficiency work, plant operation and gas supply supervision.
>
> White Eagle Oil & Refining Company, Pampa, Texas, 1930-1931, field superintendent, Gas Department.
>
> Railroad Commission of Texas, Oil and Gas Division, Pampa, Texas. Assistant Deputy Supervision in charge of Natural Gas Conservation Work in the Texas Panhandle Field.
>
> Consulting Engineer, Pampa, Texas, 1934 to date, during which time the major portion of his work has been in connection with the Texas Panhandle Gas Field.

Increase of Production in Canadian Area and Its Effect Upon Canadian Reserves

Direct testimony of Massa on this subject is contained in Volume LXXXVI, pages 13051 to 13086, Exhibit 256, pages 2 to 12.

Massa submitted on direct examination Exhibit 256, which exhibit consists of his study of the rate of production of natural gas from the Area therein referred to as the "Canadian River Gas Company Area," the increase in the rate of gas production from the area referred to, and the cause

of such increase in the rate of production, and an estimate as to the future rate of production from the Area, all of which matters have a bearing upon drainage from the leases and reserves owned by Canadian. The Area which Massa studied particularly is described by metes and bounds on pages 2 and 3 of Exhibit 256, and generally includes all of the proven gas field located in Hartley, Moore and Potter Counties, Texas, and that portion of the field located north of the Canadian River in Hutchinson County, Texas, and a small portion of the southwestern portion of Hutchinson County, Texas, and the northeast part of Carson County, Texas; and which is hereinafter referred to as the Canadian Area.

There is attached to Exhibit 256 and made a part thereof the following:

Exhibit A is a table showing the annual rate of gas production from the Canadian Area.

Exhibit A-1 contains curves showing (a) the annual rate of gas production by Canadian, and (b) the total annual rate of gas production from the Canadian Area.

Exhibit A-2 is a curve showing the annual rate of production of sweet gas by companies other than Canadian from the Canadian Area.

Exhibit A-3 is a curve showing the annual rate of production of sour and casinghead gas by companies other than Canadian from the Canadian Area.

Exhibit "B" is a table showing the cumulative production from the Canadian Area.

Exhibit B-1 contains curves showing (a) the cumulative production of Canadian and (b) the total cumulative production from the Canadian Area.

Exhibit "C" is a table showing the estimated future annual rate of production from the Canadian Area.

Exhibit "D" is a table showing the estimated future cumulative production from the Canadian Area.

All of the above described instruments constitute a part of Exhibit 256 and are found at the end of that exhibit.

Past Production from Canadian Area

Exhibits A and A-1 show that there has been an annual increase in the volume of production from the Canadian Area since 1929, the rate of increase varying from four billion to sixty-seven billion cubic feet per year. The rate of production from the Area during 1929 was twenty billion cubic feet per year compared to an indicated production from the Area for 1939 of three hundred billion cubic feet per year, an increase of two hundred eighty billion cubic feet. Stated another way there were almost fifteen times as much gas produced from the Area in 1939 as in 1929.

Exhibits A and A-1 show also that prior to the year of 1932 the production of Canadian exceeded the production of all others producing gas from the Area. However, in 1932 the combined sweet, sour and casinghead gas production of others exceeded that of Canadian for the first time, and by 1934 the production of sweet gas alone by others was in excess of the production of Canadian for the first time. Production from the Area by Canadian for the year 1939 will be approximately forty-one billion cubic feet. This amount represents 32% of the total sweet gas or 13.6% of the total sweet, sour and casinghead gas produced from the Area for the year.

Exhibits B and B-1 show that by the year of 1934 the cumulative production of other companies was equal to that of Canadian, and that by the year of 1936 the cumulative production of other companies was more than double the production of Canadian.

There has been an increase in the annual rate of production of gas from the Canadian Area in amounts shown by Exhibit A-1, and that the increase in the rate of production of gas from the Area is due primarily to the increased rate of production of companies other than Canadian.

Estimated Future Production from Canadian Area

The trend of the annual rate of production curve, Exhibit A-1, shows that an increase in the annual rate of production of gas in the Canadian Area may be expected in future years.

Any increase in the annual rate of gas production in the Area will be the result of a shift of current production from

other parts of the field to the Area, or increased market outlets.

From a study of existing conditions in the sweet gas producing zone of the field it is apparent that there will be some shift of production from the balance of the field to the Canadian Area in future years; however, no definite statement as to the amount of shift that will take place nor the time when such shift will occur can be made.

In the past, a large part of the shift of production of sweet gas that has occurred has been caused by lease consolidations on the part of Texoma Natural Gas Company. These consolidations have allocated more production to Texoma leases located in the Canadian Area due to the fact that Texoma owns large tracts of undrilled acreage in this Area but as a result of the lease consolidations this undrilled acreage is given consideration in the Company's allocation of production between its several leases, the allocation of production being based on total lease acreage multiplied by average lease open flow.

The consolidation of leases has been practically completed and most all of Texoma's acreage holdings are now considered in allocation of production. For this reason, only a small shift of production of sweet gas to the Canadian Area may be expected as a result of Texoma's consolidations of present acreage.

The operations of sweet gas pipe line companies, other than Canadian and West Texas Gas Company, now taking gas from the Canadian Area will result in a shift of sweet gas production to the Area for reasons that will be enumerated below.

One reason to expect a shift of production of sweet gas to the Canadian Area is a block of acreage, owned by Shamrock Oil and Gas Corporation, of approximately twenty thousand acres. At the present time this acreage has no market outlet but is bearing annual delay rentals. Naturally this company is and will continue to endeavor to secure a market for the gas that could be produced from this acreage.

Should the Shamrock acreage be sold to or given a market outlet by a gas pipe line company, there would be a shift in the production of sweet gas to the Canadian Area.

Since Northern Natural Gas Company's present supply of gas is located in Carson and Gray counties, where earlier abandonment of wells may be expected to occur, it is not unlikely that this company would be interested in the Shamrock acreage.

Texoma Natural Gas Company and Cities Service Gas Company are now producing large volumes of sweet gas from the field lying east of the Canadian Area and particularly in eastern Carson County and in Gray County. These areas already have a much lower gas pressure than the areas further west. It is reasonable to assume that such areas will be depleted earlier than the Canadian Area. It is apparent, therefore, that as pressures decline and less gas is available in such areas that both Texoma Natural Gas Company and Cities Service Gas Company will be forced to take an increasingly larger proportion of their total production from time to time from the Canadian Area and from lands adjacent thereto. Texoma Natural Gas Company has been increasing its withdrawals from the Canadian Area in recent years and is now taking more than half of its total production from this Area. Cities Service Gas Company has also been increasing its production from this Area during the past few years, and as above stated, will be forced to produce increasingly larger volumes from this Area and lands adjacent thereto as less and less gas becomes available in eastern Carson and Gray Counties.

The greater portion of the Panhandle Eastern reserves are already in the Canadian Area, but as pressures become lower in its wells outside of the Area and in the wells of Huber Petroleum Company, from whom it purchases gas, it will also be forced to take a larger proportion of its gas from the Canadian Area.

In addition to the gas pipe line companies now taking gas from the Canadian Area, there are other gas pipe line companies taking gas from that part of the field lying east of the Canadian Area, including a substantial quantity of gas sold by the Phillips Petroleum Company to the Northern Natural Gas Company, all of which is produced in Gray and Wheeler Counties where pressures are already very low. It is reasonable to expect a shifting of this gas production to the West, particularly the production of the Phillips Petroleum Company as this company has available

large quantities of sweet gas in or near the Canadian Area. It also is the largest owner of sour gas lands in Moore and Hutchinson Counties.

Exhibit A-3 shows that in the past there has been a rapid increase in production of sour gas in the Canadian Area. due partially to increased markets and partially to the rapid development of that part of the sour gas zone, thus causing a shift of sour gas production to the Area.

There will continue to be a shift of current production of sour gas to the Canadian Area due to the fact that sour gas production in the Texas Panhandle Field is regulated by a State proration order under which well allowables are determined on the basis of 1/3 on relative potentials and 2/3 on a relative acre/pound factor. The acre/pound factor is obtained by multiplying the lease acres by the well rock pressure.

The State proration order will bring about a shift of current production of sour gas to the Canadian Area due to the fact that there are approximately two-hundred-twenty-five undrilled, six hundred forty acre sour gas locations in the Area compared to about four such locations outside the Area. The weighted average pressure of the sour acreage in the Canadian Area is 357 pounds compared to 197 pounds for the sour acreage outside of the Area at August 1, 1939. The average open flow or potential of the sour wells in the Canadian Area is in excess of twenty-four million cubic feet per well per day compared to an average open flow or potential of nine million cubic feet per well per day for sour wells located outside the Area.

During the year of 1938 there were thirty-five sour gas wells drilled in the Canadian Area compared to eleven drilled outside the Area and during the year 1939 there were twenty-two sour wells drilled in the Area compared to five drilled outside the Area.

Practically all of the sour gas acreage in the field is under lease contracts, and in view of the past development it appears that a steady development of the present undrilled acreage may be anticipated.

As development takes place, it naturally follows that there will be a shift in current production of sour gas to the Canadian Area, for all of the undeveloped acreage lies

therein and the average well potential and average pressure of the Area are much higher than similar factors for the remainder of the sour zone. The effect of the proration formula is to give large allowables to areas of high potentials and large acre-pound factors and production occurs in relation to allowables.

The table appearing at the end of this paragraph illustrates the shift in production of sour gas from the balance of the field to the Canadian Area expected as a result of the complete development of the sour gas zone over a seven-year period. The table is based upon the application of the State proration order with a daily market outlet for 690,000,000 cubic feet of gas per day, 14.65 pound base.

It has been assumed that there will be an average of thirty-two wells drilled per year for seven years, and that pressure in the sour zone of the Canadian Area will decline at the rate of one pound per acre per 9,600,000,000 cubic feet of gas produced while the sour zone of the balance of the field declines at the rate of one pound per acre per 16,700,000,000 cubic feet of gas produced, these decline rates representing the average relation of pressure loss and production for the two year period July 1937 to July 1939, based on Railroad Commission figures. In addition, consideration was given to the fact that there are a number of sour wells lying outside the Canadian Area, having an annual production of approximately fifteen billion cubic feet per year, which are exempt from the proration order, and that the allowable gas allocated to the sour gas zone of the Canadian Area is approximately fifteen billion cubic feet per year in excess of production. Present rates of production of casinghead gas have been considered as constant:

Table

Annual Production—Sour and Casinghead Gas
1939—16.4 lbs.—174,780,000 Mcf.

	Estimated Production Sour and Casinghead Gas 16.4 lbs. Mcf.
1940	186,726,000
1941	188,657,000
1942	191,356,000
1943	193,380,000
1944	194,955,000
1945	196,081,000
1946	196,755,000
1947	197,205,000
1948	195,405,000
1949	193,605,000
1950	191,131,000
1951	188,431,000
1952	185,457,000
Total	2,499,144,000

There now exists a pressure differential of 24 pounds per acre between the sweet and sour zones of the Canadian Area. The sour zone comprises only 39% of the total acreage of the Area yet the sour production represents approximately 59% of the total production from the Area. Obviously the differential in pressure between the two zones will increase and large quantities of sweet gas will migrate to the sour zone.

Increased market outlets for the sweet gas zone is a subject on which Massa has not made a thorough study. However, a study has been made of this subject by Hendee (Exhibit 255) upon which Massa's figures as to future production from the sweet gas area are based.

In the sour zone, it is Massa's opinion that there will be an increase in the market outlet for sour gas by virtue of a decline in the production of casinghead gas, but that there will not be any material change in the combined total production of the two types of gas.

Exhibit "C" of Exhibit 256 shows his estimate of the

future annual rate of production of gas from the Canadian Area, based upon Hendee's estimate of sweet gas production for the field and Massa's estimate of the shift in production for sour gas. Exhibit "D" of Exhibit 256 shows cumulative production based on Exhibit "C."

Although he has recorded several instances where shifts in sweet gas production may reasonably be expected, the figures of future sweet gas production by companies other than Canadian from the Canadian Area are based upon current proportions of production as between the Canadian Area and other parts of the field, and do not reflect the shift of production that will undoubtedly occur. It must also be borne in mind that there are now three gas pipe lines serving Wheeler County, in addition to the Phillips Petroleum Company line, and as Wheeler County becomes more and more depleted these lines must necessarily be extended westward if the companies owning the same continue to take gas from the Texas Panhandle Field.

The witness further testified that Table A (Exhibit A) of Exhibit 256, shows that for 1928 and prior, the Canadian has produced slightly in excess of thirty billion cubic feet of gas from the Area being studied and that the total production of all companies through 1928 and prior, was only thirty-one and a half billion feet of gas and that Canadian therefore has produced practically all of the gas from the Area through the year 1928. That since 1928 the other companies operating in the Area produced an increasingly larger volume of gas as compared to the Canadian's production and that the increase has been out of all proportion to Canadian's increase. The production for the most part adjacent to the Canadian acreage has been sweet gas production. Exhibit 179 of the Commission's witness Hammer shows the sour gas line to be generally north and northeast of the Canadian acreage.

From the beginning of the life of the field to the end of 1933 Canadian produced more sweet gas every year than all of the other companies combined but during the year 1934 all of the other companies for the first time produced more sweet gas than Canadian produced.

Exhibit B (Table B) of Exhibit 256 shows cumulative production of all types of gas produced by Canadian and

also produced by Canadian and also produced by all other companies. The witness stated that a reference to this chart shows that in the year 1938 the cumulative production of sweet gas by all other companies producing in the Area being studied was in excess of the cumulative production of Canadian. The annual rate of production of all other companies, as shown by Exhibit A of Exhibit 256, became greater than the annual rate of production of Canadian for the first time in 1934, but Canadian had accumulated a back log of heavier production than all other companies during the preceding years and it took until sometime within the year 1938 for the total production of all other companies to equal the total production for all time of Canadian in so far as sweet gas production is concerned.

In 1938 the witness stated that the production of Canadian, as shown on Exhibit A of Exhibit 256, was 38,950,311 Mcf. and that the sweet gas production of all other companies for that same year was 73,995,612 Mcf., and in 1939 the rate of production of all other companies was more than twice that of Canadian, as shown by the same table.

Again referring to Exhibit B of Exhibit 256 the total cumulative production of sweet gas by Canadian at the end of 1937 was slightly in excess of 260 billion cubic feet, and the total cumulative production of sweet gas by all other companies producing in the Area was a little less than 243.5 billion cubic feet.

Starting with the year 1938 with a slight difference in favor of Canadian it was probably mid-year in 1938 before the cumulative production of sweet gas of all companies equaled the cumulative production of sweet gas by Canadian from the Area in question.

Referring again to Exhibit B (Table B) Exhibit 256, it is shown that in 1933 the total cumulative production of all companies, including Canadian and including production of all types of gas, was in excess of 209 billion cubic feet at the end of the year 1933 and the cumulative production of Canadian alone at the end of 1933 was in excess of 122 billion cubic feet. At the end of 1933, therefore, Canadian had produced more gas than all other gas production of

all types by all other companies in that area and it was during the year 1934 for the first time that all other gas companies, including all types of gas production, exceeded the production of Canadian.

The witness then referred to Exhibit A-1 (Chart A-1 of Exhibit 256) which chart contains a graph showing the annual rate of production of Canadian. It also contains a graph or curve showing the total annual rate or production of gas from the entire Area. This chart and the curves thereon show that since the end of the year 1933 particularly, the total annual rate of production has been increasing with respect to the annual rate of production of Canadian. The curve of Canadian is represented by a fairly straight line while the curve representing the total annual rate of production is represented by a sharply ascending line beginning at the end of the year 1933.

Accelerated Pressure Decline of Canadian Reserves And of Reserves Generally in Canadian Area

Massa also testified with respect to Exhibit 257 (Vol. LXXXVI, pp. 13067-13086, Exhibit 257, pp. 1-3) that this exhibit was prepared for the purpose of showing that in future years it is reasonable to expect that the volume of gas produced per pound loss of pressure will be smaller than the past and present rates of production per pound loss of pressure.

He stated that in considering this matter it must be borne in mind that much of the undeveloped high pressure acreage lies along the edges of the field. Past experience in the field has proved that most of the edge acreage will produce much smaller volumes of gas per pound oss of pressure than the average volume per pound for the field.

Another fact that must be borne in mind is the location of the leases of Canadian, both with respect to the edges of the field and with respect to pressure conditions in the field. These leases extend along the entire southern boundary of the field in Potter County and the southern and western boundaries of Hartley County. The leases of the Canadian for the most part lie in the highest pressure area of the field.

The graph (shown in Exhibit 257) of gas production per acre, in Mcf. 16.4 pound base, per pound loss of pressure, plotted in relation to cumulative production in billions of cubic feet, 16.4 pound base, shows clearly what is occurring in the western end of the Texas Panhandle Field in regard to declining gas production per acre per pound loss of pressure (that is, production per acre pound according to Hammer's figures).

The graph is based on data compiled from basic data used by Hammer, Commission Engineer, in making his estimate of gas reserves.

Curve "A" is based upon production and pressure data including all of Hartley, Moore and Potter Counties, Quadrant 4 of Carson County and Quadrants 3, 4 and 5 of Hutchinson County.

Data Used

	Acre Pounds	Acre Pound Loss	Production 16.4 lbs. Mcf.	Production Mcf. Acre Pound Loss	Cumulative Production
1935	320,492,239				
1936	317,641,213	2,851,026	210,940,635	73.99	210,940,635
1937	313,160,082	4,481,131	254,569,005	56.81	465,509,640
1938	306,397,165	6,762,917	289,318,127	42.78	754,827,767
1939	297,686,827	8,710,337	301,482,036	34.61	1,056,309,803

Curve "B" is based upon production and pressure data of those quadrants wherein lie the leases of the Canadian, including all of Hartley and Potter Counties, Quadrants 1, 2 and 3 of Moore County, Quadrant 4 of Carson County and Quadrant 3 of Hutchinson County.

Data Used

	Acre Pounds	Acre Pound Loss	Production 16.4 lbs. Mcf.	Production Mcf. Acre Pound Loss	Cumulative Production
1935	177,400,264				
1936	175,639,615	1,800,649	109,546,235	60.84	109,546,235
1937	173,671,356	1,968,259	117,805,591	59.85	227,369,826
1938	171,192,700	2,478,586	124,461,586	50.21	351,831,412
1939	167,605,974	3,586,796	133,135,223	37.12	484,966,635

The graph shows plainly that the volume of gas produced per acre pound loss of pressure has been declining

rapidly and the trends of the curves are such as to indicate that this decline will continue.

Declines in production of natural gas per acre pound loss of pressure in the Texas Panhandle Field can be attributed to but two causes, drainage and variations in the acre content of gas in various parts of the field.

Due to the fact that Curve "B," representing the area of the Canadian leases, is declining at a greater rate than is Curve "A," representing the western end of the field, it is reasonable to conclude that the leases of Canadian will produce a smaller volume of gas per acre pound loss of pressure than the average for the western zone and to conclude from both of the curves and the other enumerated facts that the rate of production per acre pound loss of pressure will continue to decline.

Massa referred to Exhibit 257 and explained the curves shown graphically in that exhibit. He stated the curves were constructed from data taken from witness Hammer's Exhibit 180 and the quadrants described in Exhibit 257 are the quadrants shown on Hammer's Exhibit 179. The quadrants, as shown on Hammer's Exhibit 179, correspond almost exactly with the Canadian Area which Massa defined and discussed in Exhibit 256, the only difference being that Massa had not included all of quadrant 3 in Hutchinson County in defining the Area which he described in Exhibit 256 as the Canadian Area. He had, however, included about half of Quadrant 3, Hutchinson County. The graph shown in Exhibit 257, however, includes all of Quadrant 3, Hutchinson County. It was necessary for him to do this because he was using Hammer's calculations and figures and he had no way to break it down into two parts in so far as Quadrant 3, Hutchinson County, was concerned.

The table on page 2 of Exhibit 257 shows that from mid-year, 1935, to mid-year, 1936, the cubic feet of gas per acre produced for each acre-pound loss in pressure was 73.99 thousand cubic feet, and from 1936 to 1937 the production per acre-pound loss had dropped to 56.81 thousand cubic feet and from 1937 to 1938 the production had dropped to 42.7 thousand cubic feet per acre-pound loss in pressure

and from 1938 to 1939 the production had still further dropped to 34.61 thousand cubic feet per acre-pound loss in pressure. There was less than half as much gas produced in the period mid-year, 1938, to mid-year, 1939, as there was produced from mid-year, 1935, to mid-year, 1936, with respect to the acre-pound loss in pressure. (It will be observed from an inspection of Hammer's Exhibit 180 that his production and pressure figures covered annual periods of mid-year one year to mid-year of the next.) The decline in pressure, as related to production, shows that the loss in pressure is greatly accelerated from year to year. If the production per acre-pound loss in pressure had been the same from year to year Curve A as shown on the graph in Exhibit 257, would have been a horizontal straight line.

Curve B, shown on the graph contained in Exhibit 257, represents comparative data plotted from Hammer's data, but pertaining only to quadrants which contain acreage of the Canadian and is the same data utilized by Hammer in making his estimate of Canadian reserves. This curve also shows a decline in acre-pounds from year to year with respect to production, or when correlated with production. The decline is not as rapid at the beginning of the period as it is for the Area as a whole and shown on Curve A but in the last two years particularly, the decline has been greatly accelerated. The four points shown on each curve represent mid-year 1936, midyear 1937, mid-year 1938, and mid-year 1939. If pressures were not dropping more rapidly than production, when related to production, Curve B would be a horizontal straight line: that is, if the production per pound loss in pressure was constant the curve would be represented by a horizontal straight line instead of a line that points sharply downward.

Cross Examination

The testimony on cross examination as to both exhibits (256 and 257) is abstracted together. The cross examination directed to each exhibit covers related subjects and the testimony is presented more clearly by considering them together.

Massa testified on cross-examination with respect to Exhibit 256 that the shift of production in the sour gas

area of northern Moore County, as shown on page 10, Exhibit 256, is based upon the application of the State proration order which he has assumed will remain in effect through 1952. (Vol. LXXXVIII, p. 13268.) In selecting the Area which he has described by metes and bounds in Exhibit 256 he took into account the acreage of Canadian and the surrounding area which contained high pressure acreage. This was done in order to study the future development and shift of production and determine the effect that it would have with respect to increased drainage. He did not include all of Quadrant 3, Hutchinson County, as delineated by Hammer in Exhibit 179, because at the time he made his study he had not seen Hammer's Exhibit and had never heard of Hammer's Quadrant 3, Hutchinson County. (Vol. LXXXVIII, pp. 13369-13370.) He was limiting his study primarily to the high pressure areas in the western part of the Texas Panhandle Field (Vol. LXXXVIII, p. 13373) for the purpose of studying the pressures and the trends of withdrawals. (Vol. LXXXVIII, p. 13374.)

It is the witness' opinion that low pressure areas will be created in northern Moore County and in northern Hutchinson County because of the tremendous withdrawals from those areas and that a situation will be created similar to the low pressure area around Borger and Sanford area. He has studied the production records in the Borger-Sanford area since 1928 and knows that that area has produced many, many, many times over the amount of gas that could possibly have been in place under the acreage in that area. (Vol. LXXXVIII, p. 13382.)

The witness studied the Canadian well pressures as they affected the weighted pressures of the Area. It is the witness' opinion that the wells in northern Moore and northern Hutchinson Counties will create an even greater difference in pressures than exists today and that the gas from the intermediate areas between Canadian leases and northern Moore and northern Hutchinson Counties will migrate northward into that area and that in turn gas from the Canadian leases will be drained to the intermediate areas. In like manner gas is being drained from Canadian acreage into Borger and Sanford area. The migration of gas is a progressive proposition. If a well is drilled and

starts producing that well at first will drain from a comparatively small area but as the pressure is reduced at the well bore and a greater pressure differential is established between that and the higher pressures in the reservoir, drainage starts and the well gradually increases its drainage area. That is what has occurred in the Borger-Sanford area. As the pressure has been pulled down and down and down the effect of the drainage into this area has been extended and is now showing up at remote parts of the field. Regardless of who produces the gas and regardless of where it is produced, when low pressure areas are created there will be a migration of gas to those low pressure areas. The witness further stated that the lower pressure differential existing in central Moore County was not caused entirely by withdrawals within that particular area. (Vol. LXXXIX, pp. 13388, 13891.)

It is not necessary to remove all of the gas from under a well to cause drainage. All that is necessary is to create a pressure differential and the greater the differential the greater the extent of the drainage. It is not necessary to create a void in order to have gas migrate into an area of lower pressure and as long as there is a pressure differential there is a movement of gas. (Vol. LXXXIX, pp. 13394, 13395.) The effect of the migration of gas into the Sanford area, and also the effect of the heavy withdrawals which are occurring in northern Moore County, northern Hutchinson County and central Moore County, are beginning to be reflected in the declining rate of production per pound loss of pressure from the Canadian leases. (Vol. LXXXIX, p. 13396.)

The witness was then asked to explain why the pressures in the Sanford area didn't remain at 430 pounds, the original pressure, if there was effective migration of gas into that area. The witness explained that it would be impossible for the pressures to remain at 430 pounds and that at the present time gas was migrating into the Borger-Sanford area more rapidly than it was being produced because the pressures were increasing. (Vol. LXXXIX, p. 13397.)

During the stripping days when the production from the

Borger-Sanford area was more rapid than the migration of gas into the area the pressures decreased but when the production was decreased then the ratio of production and migration was changed and more gas migrated into the area than was being produced, and therefore the pressures increased. (Vol. LXXXIX, pp. 13401, 13402.) There are some wells in the Borger-Sanford area that did not start repressuring in 1935 when the production was decreased. The area seems to be expanding as the back log of the migration is spreading out. There are some of the wells in which the pressure has increased only for a year or two. (Vol. LXXXIX, p. 13405.)

There was then marked for identification Exhibit 259, which was a list of the wells in the Borger-Sanford area in which the pressures had increased for the period 1935 to 1940. (Vol. LXXXIX, p. 13407.) The witness stated that effective drainage does not mean necessarily that the wells receiving the drainage will increase in pressure. It all depends on whether the rate of withdrawal from the wells was greater than the rate of migration. No one has ever questioned the fact that there was migration of gas into the Borger-Sanford area. The witness was again asked if it were not true that if there was effective drainage that pressures would be maintained notwithstanding the rate of production and the witness again answered that there couldn't be maintenance of pressure as long as the rate of production was in excess of the rate of migration. (Vol. LXXXIX, pp. 13408, 13409.) The witness has not attempted to evaluate the volume of migration of gas into low pressure areas. He has simply attempted to show the trend of drainage. (Vol. LXXXIX, p. 13411.) Migration of gas into the Sanford area has been reflected in lower pressures in central Moore County but is not entirely responsible for the low pressures in Moore County. (Vol. LXXXIX, pp. 13416, 13417.)

The witness further testified that although in his written statement introduced in his direct examination he had pointed out that there were a number of pipe lines operating in the east field, which lines would possibly be extended into the west part of the field as the east field became exhausted; nevertheless, he did not attempt to evaluate

this fact and did not give that possibility any effect in his study of the western part of the field. It is natural to expect, however, that abandonments will occur in the east field first because of the lower pressures existing there now. He did not consider this fact in his estimate of future production in the west field because it could not be definitely evaluated although he does believe that some of the companies operating in the east field will extend their lines into the west field. (Vol. LXXXIX, pp. 13420-13427.) The witness also stated that although he had mentioned that there was a great deal of undeveloped acreage owned by Shamrock Oil and Gas Company adjacent to Canadian and that this acreage would possibly find a market sooner or later, still he did not attempt to evaluate the extent of the possible production from this acreage and it is not reflected in any way in his computations but it is definitely in the picture so far as the future is concerned. (Vol. LXXXIX, p. 13342.)

Witness was then referred to Exhibit 187 by Thompson with particular reference to the Shamrock undrilled acreage in eastern and southern Moore County, which was shown to have pressures ranging from 300 to 350 pounds, and was asked what happened to the gas that came out of that undrilled acreage and the witness replied that it appeared to him that it probably migrated to the Borger-Sanford area. That it could not have gone to Texoma's acreage because the pressures in the Texoma acreage were higher than the pressures in the Shamrock acreage. (Vol. LXXXIX, pp. 13433-13434.) That Canadian in the early part of 1929 and prior and up to 1930 or 1931 was taking more gas from its area than the other companies but the market outlets acquired since then by other companies have enabled them to overcome the cumulative effect of the early Canadian production and that the increase in production of others has been greater than the increase in the Canadian production. (Vol. LXXXIX, p. 13441.)

The witness stated that the shift of production of sour gas into the Canadian Area is based upon the assumption that the market for sour gas will be constant at 690 million cubic feet of gas per day, which is the present allowable production. He has allowed for no increase in this pro-

duction but has considered that the sour gas acreage in the west part of the field will be developed over a seven-year period and that as additional wells are drilled, and additional potential and pro-ratable acre-pounds come into the picture that these wells will be allocated a certain production under the proration order, which is based largely upon acreage. (Vol. LXIX, 13452, 13453.) This estimate is based upon the conditions as they exist today and it was made from the witness' best judgment of the factors that were present. (Vol. LXIX, p. 13454.) The witness, upon being asked whether the use of sour gas for gasoline and carbon black was wasteful, replied that there are so many things involved that it is a relative proposition and as long as the gas is being utilized it might well be claimed that it is not wasteful. (Vol. LXIX, p. 13458.) The witness stated that he could not state definitely that sour gas would be used for carbon black purposes in the future but that he has assumed that things will go on just as they are today. (Vol. LXIX, p. 13459.)

The witness was questioned at length with respect to the compilation of his figures for sweet gas production, and he stated that these were taken from records in the Railroad Commission's office and that where the pressure base was not given he determined from the various producers in the area the pressure base that had been utilized in reporting their production. That the pipe line companies prior to August, 1935, reported their production on a 16.4 pound basis. (Vol. LXIX, pp. 13464-13471.) He also procured his production figures of gasoline plants from the plants that were operating in the area up to 1932 and subsequent to that from Form 3 reports filed with the Railroad Commission and made necessary corrections as to the pressure base. (Vol. LXIX, pp. 13476-13488.)

With respect to Exhibit 257 the witness testified on cross examination that the curve which he had constructed, and which was a part of Exhibit 257, was a very common curve and it showed the rate of production per acre-pound loss of pressure and that natural laws, Boyle's Law, governs the per pound loss of pressure as related to production. The witness plotted the curve in the manner that he did for the purpose of showing the comparison in

the two areas involved. There is nothing complicated about it. If both areas had been of uniform size and uniform acreage it would not have been necessary to reduce the vertical ordinate to acre-pounds but he could have stopped at simply showing pounds, but in order to make a fair comparison of the two curves it was necessary to relate it to acre-pounds. If the fundamentals of Boyle's Law were applied it would show a uniform drop in pressure as related to production, or approximately so, but where the rate of production per pound loss in pressure is constantly declining, as it is in the west part of the field, there is some unknown factor that is causing the simple application of Boyle's Law to give an erroneous answer. (Vol. LXXXIX, pp. 13505-13512.)

In plotting production or pressure loss against production in order to obtain a straight line (horizontal) you would have a constant rate of production per pound loss. This is production per pound loss brought down to an acre basis for the purpose of comparison of curves A and B which are based on different sized areas and since the Canadian curve is declining at a faster rate than Curve A this shows that the Canadian acreage is being drained by the remainder of the acreage in the area. At least the drainage has had its effect and the witness thinks that the variation in the original per acre content has also had its effect, but since 1937 there has undoubtedly been intensive drainage or a variation of the per acre content. In other words the effect of withdrawals is reaching out in the edge acreage which is likely to be less productive than the other acreage. (Vol. LXXXIX, pp. 13514, 13515.)

The trend of Curve B, Exhibit 257, indicates that the rate of production is declining faster in the quadrants which contain Canadian acreage than it is for the area as a whole, which also includes Canadian quadrants. The fact that Canadian acreage lies generally in the high pressure zones and the fact that there is so much of the Canadian acreage along the edge of the field leads to the conclusion that this acreage would produce at a much smaller rate in the future. (Vol. LXXXIX, p. 13527.) All figures indicate that the rate of production in the Texas Panhandle Field per pound loss in pressure is constantly decreasing.

that is, they show a decreasing rate of production per pound loss of pressure weighted as to area. We are constantly getting less production per pound drop. All of the available data indicates a downward trend but the witness cannot say definitely what this trend will be in the future. (Vol. LXXXIX, pp. 13528-13530.)

The witness stated on redirect examination that the production per acre pound loss was determined from the production figures and weighted pressure figures taken from Hammer's working papers. That he simply used Hammer's figures, and this being true, he necessarily included all of Quadrant 3, Hutchinson County, in Exhibit 257, although he had included only a part of it in his study reflected in Exhibit 256. The fact that he did use all of Quadrant 3, since he was using Hammer's figures, had a tendency to hold his curve up. In other words, if he had left out some of the low pressure wells in Quadrant 3, Hutchinson County, his curves would have declined more sharply, but in any event he had simply followed the foosteps of Hammer in his calculations as reflected by Exhibit 257 and used the same quadrants that Hammer had used in estimating the reserves for the Canadian acreage. (Vol. LXXXIX, pp. 13534-13537.)

The southwestern portion of Hutchinson County is gaining gas from the higher pressure areas to the southwest and is also losing gas by virtue of drainage away from the area to the northeast. The fact that pressures have declined a little, or greatly, in that area does not necessarily mean that it was not losing gas to the northeast toward the Sanford area. The movement of gas into the southwestern portion of Hutchinson County from the higher pressures on the southwest is replenishing some of the loss being suffered to the lower pressure areas to the northeast. Movement of gas cannot be restricted to small areas. Small areas cannot well be considered in arriving at the mass movement of gas that necessarily occurs from a high pressure area to a low pressure area. (Vol. LXXXIX, pp. 13538, 13539.) The wells listed on Exhibit 260 which are gaining in pressure in the Borger-Sanford area, do not constitute the only wells in southwest Hutchinson County that are receiving gas by drainage. There are other wells

that are producing gas with much lower than average pressure drops. There is a gradual increase in pressure drops as you get away from the low pressure areas. A well may be receiving gas by underground migration, even though it shows a reduction in pressure from year to year, where the pressure drop is slight in relation to the volume of gas produced. There is no doubt that a well in a lower pressure area is receiving some gas from the high pressure areas adjacent although it may not be retaining it. (Vol. LXXXIX, pp. 13542, 13543.)

With further reference to the increase in the drilling of wells in the Canadian Area, as described by the witness in Exhibit 256, he stated that in 1938 there were 107 wells drilled in the entire Texas Panhandle Field, both east and west fields, and there were 53 wells drilled in the Canadian Area, or 49.5% of all the wells drilled. In 1938 there were 98 wells drilled in the entire Texas Panhandle Field and 58 of these were drilled in the Canadian area, or 59% of the total number of wells drilled. In 1940 there were 94 wells drilled in the field as a whole, and of these 63 were drilled in the Canadian Area, or 67% of the total number of wells drilled. (Vol. LXXXIX, p. 13547.)

In 1940 there were 39 sour gas wells drilled in the field as a whole and of these 34 were drilled in the Canadian Area. The witness had estimated, as shown by his Exhibit 256, that there would be 32 sour gas wells drilled in the Area in 1940. His estimate was less than the number actually drilled. (Vol. LXXXIX, pp. 13547, 13548.)

The witness had previously testified in his direct examination that in 1939 there were 27 sour gas wells drilled in the field, and of these 22 were drilled in Canadian Area and that in 1938 there were 46 sour gas wells drilled in the entire field and of these 35 had been drilled in the Canadian Area. (Vol. LXXXIX, pp. 13061, 13062.)

The witness further testified on recross examination that the rate of decline of pressure in the Canadian acreage is now going down faster than the pressure of the other acreage in the Canadian Area and the Canadian acreage is so located around the edge of the field that gas loss cannot be replaced by drainage from other higher pressure

areas. The pressure in the Canadian acreage is declining more rapidly at the present time and it is quite likely that as the higher pressure areas decrease the pressure differentials will decrease, and for all intents and purposes the pressures will pretty well balance out. (Vol. LXXXIX, pp. 13553, 13554.)

J. B. Massa further testified on cross examination (Vol. 89, pp. 13408-13414; 13416-13419; 13505-13515; 13538-13539; 13542-13544; 13547-13548; 13565-13569) as follows:

Q. If there had been effective drainage by these wells in the large area of the field, Mr. Massa, in the other wells over in the Sanford-Borger area, would not the pressures in all of the wells have been maintained?

A. No, because their rate of withdrawal was greater than the rate of migration and they just couldn't keep up with it, Mr. March. I think that is very evident in the fact that when the rate of production was decreased from the area it has gone ahead and shown up in the form of repressuring of the buildup in pressure for the area. I think it is just as apparent as it can be and I have never heard anybody question the fact there was any migration of gas to the area before.

Q. I am learning things in this case.

A. Yes, sir.

Q. If there had been effective drainage, Mr. Massa, the pressures would have built up or would have been maintained, would they not, without having to curtail the production in those wells to let the pressures build up?

A. There couldn't be maintenance of pressure as long as the rate of production was in excess of the rate of migration, Mr. March.

Q. Why would you ever have a rate of production in excess of the rate of migration?

A. Because—

Q. If you had effective drainage, that could not ever exist, could it?

A. Because of your difference—flow conditions out of a well bore through a formation.

Q. We come now to the obstacles.

A. Certainly, that is not a big can down there.

Q. And it isn't a big ice cream soda. The container has many obstacles which prohibits the free movement of the gas from the low pressures to the high pressures, doesn't it?

Mr. Spencer: He would have said that a long time ago if you had asked him, Mr. March.

The Witness: There is no flow through that reservoir like there is in your ice cream soda.

By Mr. March:

Q. Have you made a study of the geologic conditions, the formations through which the gas flows, to ascertain the rate of flow from one portion of the field to another?

A. No, sir, I have not attempted in any way to evaluate the quantity of gas that has migrated. I have simply pointed out by virtue of difference in pressures the fact that the pressures have increased and there must be a migration of gas in that direction. I have not evaluated it.

Q. Look at those averages there. They have all happened since 1936 and 1935, have they not?

Mr. Spencer: You are referring now to Exhibit 259?

Mr. March: Yes.

Q. They go all the way from one pound—I see one 57-pound well and one 46-pound well. That is the highest, 57 pounds?

A. Yes.

Q. From one to 57 pounds. Mr. Massa, don't you think that is a very very small increase in pressure considering the tremendous decrease in the production from those wells?

A. A buildup, Mr. March, of 57 pounds would represent approximately one-eighth of the gas in place under that land.

Q. How do you know how much gas was originally under the land?

A. I was talking in reference to pressures entirely. 57 pounds is about one-eighth of 430 pounds.

Q. Then you think you can tell how much gas is in place by plotting your production against pressure declines, is that right?

A. I have not evaluated it and I have not stated it in cubic feet at all. I have simply said that it represented one-eighth of the gas originally in place.

Q. Do you think you could use the pressure decline method in ascertaining drainage to and from an area?

A. Only as an estimate, not definitely. You can get ideas from it but I wouldn't attempt to and I have not attempted to evaluate the drainage that was there because of the fact that it does throw you too many curves. I have played with it too much.

Q. You have played with it too much?

A. Yes, sir.

Q. Well, 57 pounds is the highest pressure you have here, the highest increase in pressure. How much would you say one pound was of the gas originally in place there?

A. One 430th.

Q. You think the pressure decline method works like that in showing drainage? Do you think it really does?

A. It works like what, Mr. March?

Q. It enables you to tell how much gas has been lost there?

A. I have told you I haven't attempted to put any evaluation on it as I simply stated it showed the trend. No, I wouldn't attempt to evaluate it. I can give you some figures and let you draw your own conclusion, but I don't say they are right, because they jump around too much. If Boyle's Law is applicable, it would necessarily come out a constant figure.

Q. Have you ever made an estimate of reserves of the Texas Panhandle field?

A. No, sir.

Q. Are you a geologist?

A. No, sir.

Q. What are you? What is your profession?

A. I am a natural gas engineer.

Q. A natural gas engineer?

A. Yes.

Q. Did you ever have a course in geology?

A. No, sir.

Q. Do you think you have ability enough and your background enables you to make any interpretation or appraisal of the drainage conditions in the Panhandle field of Texas?

A. As relates to flow of gas by virtue of differentials in pressure, I think that I can very definitely say that I am not familiar with the flow of gas by virtue of the differential of pressures. I have not attempted to put a quantitative value on what these things will do because there are too many changes that can take place and the thing is not established enough to a definite trend to know where you can set a quantitative value on it.

Q. If the pressures will only increase this much, would you attempt to say how much gas had drained to the area?

Mr. Spencer: He has said time and time again he is not evaluating it as to quantities.

Mr. March: I want to know if he would do it as an engineer.

Mr. Spencer: I object, Mr. Examiner, as he has explained that very fully.

The Witness: I think I told you, Mr. March.

Mr. March: He has done plenty of evaluating. He has said there is drainage, and I am going to make him prove it.

Mr. Spencer: He has done that already.

Mr. March: He shouldn't make statements in his exhibit—

The Trial Examiner: There is no use in repeating the question, Mr. March.

By Mr. March:

Q. As an engineer, I want you to state how much drainage there has been in the area where you have the small increases of pressures in those wells, just whether you would attempt to do it. Would you?

A. I wouldn't attempt to do it on the basis of those pressures alone.

Q. These pressures alone show there has been little drainage in the area, doesn't it?

A. It is taking the fact that the increased buildup there would indicate a small thing, but when taken into consideration with the production during the period of time that those pressures were building up and back down to their low pressure periods, it would indicate a greater quantity. There is no way of evaluating this buildup and the only evaluation I could place upon it would be the volume of gas produced between the high and the low pressure or between the low and the high pressure, and then that this additional value has accrued for it, but we have no way of evaluating it because we have no definite and established amount of gas per acre pound.

Q. You mean originally?

A. Yes, sir.

Q. I thought your geologists told you that.

A. I am talking about it from my own knowledge, Mr. March.

Q. Oh, your own knowledge. I see.

A. In relation to the other factor, I would have to take it in conjunction with someone else's study.

* * * * *

Q. Now, my question is this, Mr. Massa. I want to know whether or not the pressure band of 380 to 360 pounds shown on Mr. Thompson's exhibit is due to withdrawals in that band or whether or not the decline is due to drainage.

A. I haven't studied that particular area. My study was made on a regional basis. I didn't use the smaller contours. It is true enough that they show in several instances local lows, but in considering the thing from a reional point of view, the wider contour bands give a better picture. I grant that those local lows there, that there is a movement of gas locally to that area.

Q. My question doesn't include that, though. My question is this: You made a voluntary statement here that the drainage of the *Sandord* area was now being reflected back up here in the Texoma acreage up in central Moore County in this 380 to 360 pressure area up there.

Now, I want to know whether or not of your own knowledge—

A. Did I say that?

Q. I understood that you did. Did you say that?

A. I don't think so.

Q. Then you are not contending that that area was drained by the Sanford area?

A. I contend that the Sanford area has had its effect, but I wouldn't say that the entire thing was responsible—that the Sanford area was responsible for the entire drop of pressure in there.

Q. I want to know this: whether or not you are able to state here of your own knowledge whether or not the pressure decline in the 360- to 380-pound band in central Moore County has been due to the intensive withdrawals since 1935 or due to drainage. Can you say positively?

A. I have made no study of that contour band there.

Q. I know, but you—have you made any study of the low pressures that have been created there in central Moore County in that Texoma acreage there?

A. As related to central Moore County?

Q. That's right.

A. No. I have given consideration to the rates of production in relation to the pressure loss—

Q. Are you through?

A. I was trying to state something.

Q. Excuse me.

A. I have given consideration to the decreasing rates of production per acre pound loss of pressure, Mr. March, and as I say, I made my studies from the Commission's pressure map and I have not studied that 260 to 280 pound band particularly or any other pound band. As a matter of fact, I didn't study it by pressure contours. It is more or less an area proposition.

Q. So, therefore, you can't state whether or not the pressures went down in Central Moore County because of the intensive withdrawals since 1935 or because of drainage?

A. Not any given spot in central Moore County, no, sir.

Mr. Keffer: Mr. March has asked a question two or three times referring to central Moore County and Texoma as to all of the acreage in that area owned by Texoma Natural Gas Company. I don't know as it makes a bit of difference, Mr. Examiner, but I do want the record straight on that and I would like to ask the witness if there are other companies producing in that area other than Texoma Natural Gas Company.

The Witness: Yes, there is some other production in there.

Mr. Keffer: What other companies produce large volumes of gas in that area other than Texoma Natural Gas Company?

The Witness: *Primcipally* Shamrock Oil & Gas Corporation and Panhandle Eastern.

Mr. Keffer: That is all I wanted.

Mr. March: All right.

Q. I want a little something now. Texoma produces most of the gas in that area you are referring to, don't they?

A. Yes, sir, I think Texoma is by far the largest producer of gas in that area.

Q. Their most prolific area is located in that band of 360 to 340 pounds in central Moore County, isn't it?

Mr. Lange: You are referring to Exhibit 187?

Mr. March: Yes.

The Witness: By "prolific acreage," you mean what?

By Mr. March:

Q. Prolific production. Most of their production comes from there. Their best acreage is located there.

A. I haven't studied it as to that particular point of production, Mr. March. They do have a large production in Moore County. As I said, I haven't studied it as to minute points of that sort.

Q. And you haven't studied the field at all on 20-pound contour pressure bands?

A. No, sir.

Q. And since you haven't done it on 20-pound pressure —contour pressure bands, you haven't done it on 10-pound contour bands?

A. No, sir.

Q. The only thing you have studied is these 50-pound bands of the Railroad Commission put in by Mr. Dunlap?

A. The Railroad Commission maps from which Mr. Dunlap's maps were reproduced are on 50-pound isobars.

* * * * * *

Q. Now we come to Exhibit 257. I refer you first to this curve you plotted over here, the last curve. Where did you ever hear of a curve like that before? Did you ever hear of a curve being plotted like that before?

A. Yes, sir.

Q. Where?

A. The rate of production curve is quite a common curve.

Q. Quite a common curve? When did you ever use such a curve like this in any other hearing or any place else?

A. I have used them in working in my office quite often. I don't know that I have ever used one in a hearing.

Q. This is the first time you have ever used one in a hearing, isn't it?

A. I don't know that I have ever used one before.

Q. Did you ever hear of one being put in a hearing before?

A. I don't know that I have, however, they could have readily have been and I wouldn't have heard of it.

Q. Let's see if I can understand what you have done

there. You have two curves, A and B, so you plot first—I will go through the three things I understand you did—you plot your gas withdrawals over one year against your gas taken out over several years; you plot one acre against many acres. I have calculated here as far as Curve A is concerned, you have plotted one acre against 790 thousand acres in regard to Curve A, and approximately 443 acres in curve B; then you plot one pound against the pounds lost for the production involved, is that right?

Mr. Spencer: Mr. Massa—

The Witness: I don't think it is, Mr. March, as nearly as I could follow you.

Mr. Spencer: Take it step by step.

By Mr. March:

Q. On your vertical tangent here you have production per acre in Mcf., 16.4 pounds per pound loss of pressure.

A. That is right.

Q. Then over on your horizontal—

A. In other words, that is the rate of production per pound loss of pressure, rate of production per acre.

Q. The rate of production from one acre?

A. That is the average rate per acre. It is the average.

Q. That would be one acre. What would it be for one acre?

A. And it would be the average for each acre over the whole area.

Q. That is what it would be for the average acre?

A. For the average acre and each one of the acres.

Q. But you use the word "per" which is the average acre. You are speaking of one acre?

A. It is the average acre. It refers to one acre or all of them.

Q. You referred to pounds lost; do you mean one pound lost?

A. Every pound loss per one acre.

Q. Average pound loss per one acre?

A. Yes, sir.

Q. Per one year?

A. For volume of gas produced.

Q. For one year?

A. It is an annual period that is represented there; however, the yearly periods on the chart are not uniform and are not controlled by time but by volume of gas produced during the year.

Q. But in so far as time is concerned in your vertical tangent it is one year?

A. The rate is for the gas produced during a given year. Each point represents a rate for the year previous.

Q. You plotted that against the cumulative production in one hundred billion cubic feet of gas at 16.4 pounds base?

A. That is right. The points are plotted to show the volume of gas produced at each given rate.

Q. Isn't that the same thing as—if it isn't, I want to know, and I am not trying to be funny—the same thing in that a hen lays in one year against the number of eggs she has laid in her lifetime?

A. You could plot a production rate on eggs, I believe.

Q. Isn't that a homely illustration of what you have done here? You have plotted cumulative against yearly, have you not?

A. That is quite true; however, there are no natural laws governing the rate of production of eggs per year and there is a natural law governing the rate of gas production per pound loss of pressure.

Q. Of course I could argue that, but what natural law is it that governs the per pound loss of pressure?

A. Your Boyle's Law.

Q. I thought you said Boyle's Law didn't work in the Panhandle field, or did you say that?

A. I don't think that it does and I think the graph shows it doesn't.

Q. Yet you used Boyle's Law to show that Boyle's Law didn't work?

A. To show that it is not applicable for the purposes for which it has been used.

Mr. Spencer: In the Texas Panhandle field?

The Witness: In the Texas Panhandle field.

By Mr. March:

Q. You have used Boyle's law to show that?

A. That is correct.

Q. I want to ask you this question: if Boyle's law does-

n't work in the Panhandle field, how can you use Boyle's law to show it doesn't work in the Panhandle field?

A. Just as I have used it here, Mr. March. If Boyle's law was applicable, instead of having these declining lines on this graph you would have a horizontal line and this is simply a method—

Q. Have you ever plotted in a field the production as you have plotted it here to determine whether or not Boyle's law would work in any given field?

A. No, sir.

Q. In the manner you have done it here?

A. I have seen this graph used to illustrate the accuracy of a curve to prove it in various articles.

Q What articles?

A. Different articles I have read from time to time.

Q. Did they teach you this in school in text books that it was a good way to show Boyle's law wouldn't work?

A. No, I don't think that they did.

Q. Did you ever see anything like this in a text book?

A. I don't recall that I have offhand.

Q. Who told you about this curve—Mr. Gill?

A. No, sir.

Q. You devised the curve yourself?

A. No, I have seen the curve used before.

Q. Who used it?

A. The reason I plotted this curve in this manner, Mr. March, is for the purpose of comparison of two areas. There is nothing so complicated about it. Had this curve for an area been of uniform acreage, it would not have been necessary to reduce the vertical ordinate to acre pounds but we could have stopped at pounds because it would have been a uniform area that we were comparing, but simply for the purpose of being fair in the comparison of the two curves, I reduced it down to a common denominator of acres. That is all the difference. One would be the lowest per pound and the other would be the lowest per acre pound.

Q. As I notice your exhibit, the first paragraph of it, it doesn't say anything about it showing Boyle's Law doesn't work. You are trying to show, as I get it, that you have a greater rate of production loss per pound in the Canadian River area than you do in the entire west of the field as you have delineated it.

Mr. Spencer: You brought that out on cross examination.

Mr. March: I just started the cross examination on this exhibit.

Mr. Spencer: You say that if Boyle's law doesn't work why use it here. You brought that up, Mr. March.

Mr. March: He says this exhibit has been prepared for the purpose of showing that in future years it is reasonable to expect that the volume of gas produced per pound loss of pressure will be smaller than the past and present rates of production per pound loss of pressure, and over on Page 3 he says "Due to the fact that curve B representing the area of the Canadian River Gas Company's leases is declined at a greater rate than his curve A, representing the western end of the field, it is reasonable to conclude that the leases of Canadian River Gas Company will produce a smaller volume of gas per acre pound loss of pressure than the average for the western zone."

Mr. Spencer: My only point is that you started into the discussion of Boyle's law by asking if he hadn't said that he didn't agree with Mr. Boyle; if Mr. Boyle's law wouldn't work, and that is the way he got on it—

Mr. March: I will ask the witness this:

Q. I will ask you if you applied any of the fundamentals of Boyle's law in any of the curves you drew?

A. Mr. March, your Boyle's law is the relation of the volume of gas under given pressures and the relation of gas production in pressure drop is necessary to base your Boyle's law as involved, and on this, as I say, under Boyle's law the production of a given amount of gas should bring about a uniform drop in pressure constantly or approximately so.

Naturally, you don't expect to get a perfectly straight line in a field that size, but where the rate is constantly declining it appears that there is some unknown there that is throwing Boyle's law off because Boyle's law is based on a uniform container.

Q. You say you wouldn't expect it to be exactly a straight line in a field that large?

A. No, sir, but I wouldn't expect declines such as this. In constants you would expect a variable line up and down.

Q. If you had a line like that you would say that Boyle's law was working fairly well?

A. I think if you had a constant line with not too much variation in it, there would be some logic in drawing a line through your points above and below.

Q. Have you ever in all your experience plotted the yearly decline in Canadian River's acreage against the yearly production from the wells in that acreage?

A. For Canadian River leases themselves?

Q. Yes.

A. No, sir.

Q. How do you know, if you didn't plot your pressure against your production in the Canadian River leases themselves, that you wouldn't get over a period of time a line which does go up and down but approaches a straight line on the average?

A. The same data can readily be plotted in that manner, and from this curve here you can readily see that it would not be a straight line as it would be—

The Trial Examiner: Which curve?

The Witness: Curve B.

By Mr. March:

Q. But this curve is not a plotting of your pressure decline against your production, it is a plotting of two unlike things against one another as I see it, because you plot production per acre Mcf. at a 16.4 base against cumulative production.

A. Mr. March, in plotting—

Q. You have production in both of these tangents here.

Mr. Spencer: Are you going to let him complete his answer?

Mr. March: Yes.

The Witness: In plotting production or pressure loss against production in order to obtain a straight line you would have to have a constant rate of production per pound loss to do it. This is production per pound loss or per acre pound loss brought down to an acre basis for the purpose

of comparison of curves A and B which are different areas, different sized areas.

By Mr. March:

Q. Do you have any idea of what sort of a curve you would have gotten if you had applied Boyle's law to the Canadian River wells and acreage alone and plotted your pressure decline against your production? Have you any idea what sort of a curve you would have gotten there?

A. No, I have never plotted their acreage.

Q. It looks to me like you have done quite a bit of experimenting in plotting these two curves here that you have in this exhibit.

A. A lot of experimenting?

Q. Yes, to find out the appropriate manner in which to plot it.

A. I don't get your point.

Mr. Spencer: Mr. Examiner, I object as to why the witness didn't prepare some other exhibit than he has prepared.

Mr. March: I will withdraw the question.

Q. As I gather, you are trying to show here that since the Canadian River curve declines at least some faster than Curve A that the Canadian River acreage is being drained by the rest of the acreage in the field, is that what you are trying to say?

A. I think that drainage has its effect and I think that the variation and the original per acre content has its effect.

Q. You think that the Canadian River has less per acre content to begin with than the rest of the west portion of the field you have delineated here?

A. I would not say of the Canadian River's acreage as a whole but undoubtedly from what has happened to these curves since 1937 there is very intensive drainage or a variation of the per acre content. In other words, the effect of withdrawals is reaching out into the edge acreage which is likely to be found to be less productive than the others.

• • • • •

Q. All right, now, back to Exhibit 256. Mr. March spent some little time with respect to the pressure drop in the southwestern part of Hutchinson County and in what you might term the four center areas around there.

Now, I will ask you whether it is a fact or not that that area, the southwestern portion of Hutchinson County, as production continued in there, that it did not necessarily gas in by migration of gas to the southwest; that is, gas from the southwest was moving into that area?

A. I think it is in the general trend of migration from the contour lines and being at a lower pressure there has naturally been gas going that way and the pressure has been maintained to some extent due to it.

Q. The gas has been going out on the other side, hasn't it?

A. Most likely.

Q. That is right. Now, as a matter of fact, whether pressures declined a little or greatly in that area, does not necessarily mean that it was not losing gas to the northeastward in the Sanford area?

A. I wouldn't think so.

Q. Because you have this drainage situation on the other side, that certainly is replenishing some of the loss, isn't it?

A. Yes, sir, your movement of gas cannot be restricted to any small area. The farther away you go from any well bore the area being drained by that well increases and the same can be said of the Sanford area, the Sanford-Borger area; the more it spreads out the greater becomes the area as it gets away from that. It can't be draining from one well to another or one minute area to another. It can't very well be considered in arriving at the mass movement of gas that necessarily occurs from a high to a low pressure area.

* * * * *

Q. Does the fact a producing well is losing pressure mean that it is also not receiving gas by drainage from higher pressure areas? In other words, maybe I didn't state that clearly.

Is it possible for a well to be receiving gas by underground migration even though it shows a reduction in pressure from year to year?

A. Yes, sir. Where your pressure drop is very slight in relation to volume of gas produced, it is quite logical that there is migration of gas to that tract.

Q. Isn't it a pretty safe assumption that any well in a

low pressure area is receiving some gas from the high pressure areas adjacent?

A. There is no doubt that there is gas flowing there, and as to whether or not they are retaining it is something else. There are all kinds of things that come in there. Your ratio of production to migration would be the whole thing. Of course there is gas flowing to the lease.

Q. Now, Mr. March, also asked you if you had studied the area which you have under consideration in your two exhibits with respect to the contour lines existing. As I recall it, you answered that you had made no specific study with respect to specific and particular segments between any two certain isobar lines. Is that correct?

A. That is true.

Q. But the figures which you have utilized in your Exhibit 257 were taken from Mr. Hammer's figures which were based upon his 10-pound isobar line contours, were they not?

A. Yes, sir, the figures in Exhibit 257 came from Mr. Hammer's 10-pound—his data was all taken from that map, as I understand it.

Q. As he computed it?

A. Yes, sir.

* * * * *

Q. There has been some question also about the drilling of new wells in the western portion of the west Panhandle field which you have referred to as the Canadian River area. Can you give me just briefly the drilling in that area for the last three years as compared to the drilling in the entire Panhandle field as a whole, east and west included?

A. In 1938 there were 53 wells drilled in the area as compared to 107 wells in the field, or 49.5 per cent of the wells drilled in that area.

Q. What was it in 1939?

A. In 1939 there was a total of 58 wells drilled in the Canadian River area. In referring to the Canadian River area here I mean what I designated in my Exhibit 256 as the Canadian River area. There were 58 wells compared to 98 wells for the field as a whole, or 59 per cent of the wells, and in 1940 there were 63 wells drilled there as compared to 94 total for the field, or 67 per cent.

Q. When you say the field, that includes the east field and west field, doesn't it?

A. Yes, sir, that includes Wheeler County.

Q. What was your drilling in 1940 with respect to sour gas wells?

A. There were 34 wells drilled in the area as compared to a total of 39, for the field.

Q. 39 sour gas wells included in the entire field and 34 are in the Canadian River area, is that correct?

A. That is correct.

Q. You made an estimate of how many sour gas wells would be drilled in 1940 and I am wondering if you missed that very far.

A. I used an average figure throughout the 7-year period of 32 wells.

Q. In the first year there were 34 wells?

A. Yes, sir.

* * * * *

Q. Have you ever made a study of the effect of Texoma wells upon the decline of pressure in Moore County?

A. Texoma wells?

Q. That is right.

A. No, sir.

Q. When did you prepare this Exhibit No. 260 showing the 1940 pressures from wells were remaining stable or increasing.

A. I prepared that with Mr. Thompson when I came back.

Q. Did Mr. Thompson prepare that or did you prepare it?

A. I helped him prepare it. We prepared it together. I got the production data.

Q. You got the production data?

A. Yes, and then I helped.

Q. Did you also get the production data of these wells for 1935 and compare them with 1940?

A. No, sir. I have 1940 production data.

Q. Do you know whether or not 1935 production was a lot more than the 1940 production?

A. Yes, sir; I so stated this morning that the production in 1935 and 1936 was much in excess of the present rates and that the fact that these wells were now repressuring was due to the difference of ratio that existed between the production and migration.

Q. Due to the production and the taking of gas from these wells?

A. Yes, sir.

Q. You haven't implied here that if you had included all of the Hutchinson County, and both the Sanford and Borger areas in your calculations of the Canadian River?

A. Sir?

Q. You have implied here on redirect examination as I understand it if you had included the Sanford area and the Borger area in the Canadian River—

Mr. Keffer: It wasn't that at all. It was all of Quadrant 3, Hutchinson County. He testified to that simply because you complained he had not included all of Quadrant 3, Hutchinson County.

By Mr. March:

Q. As a matter of fact you did include all of Hutchinson Quadrant 3 when you *hade* your curve B didn't you?

A. In Exhibit No. 257 all of Quadrant 3 is included, yes.

Q. According to your own theory then by including that all in Quadrant 3 you tended to decline the crop of the curve?

A. I didn't state that, Mr. March. What I said was that by including all of Quadrant 3, Hutchinson County, which includes some of the wells which are repressured, the tendency is to show a greater production per pound drop of pressure than is shown by the curve—than would have been shown in the curve if it had been left out. In other words, it shows a higher rate of production per pound drop than would have been shown if I had left it out, which is only natural. I don't know what the effect would have been as I haven't calculated it.

Q. You haven't calculated it out to ascertain it?

A. No, but if you have wells that are not *droping* in pressure and you have production from them you are adding to the production without decreasing or without increasing your pressure loss factor and naturally you are taking a greater amount of production and dividing it by the same or a lesser pressure loss and will get a greater production per pound loss.

Q. All of the wells you enumerated this morning are in Quadrant 3, Hutchinson County?

A. No, sir; I didn't say they were.

Q. Did you know in every one of Mr. Hammer's quadrants in Hutchinson County that the pressures are declining and not increasing in spite of the repressuring of some of the wells?

A. I haven't checked them. They may be.

Q. Do you know whether or not in Quadrant 3, Hutchinson County, the pressures are decreasing or increasing?

A. According to the way he has the quadrants laid out and the figures he has used in his quadrants I know the pressure is showing a decline, yes.

Q. It is showing a decline?

A. Yes.

Q. It is showing a decline in spite of the fact that some of the wells have showed a slight increase in pressures?

A. That is true.

Q. Have you made a study to ascertain what has been the pressure drop in Hutchinson County as a whole in 1940?

A. No, sir.

Q. In 1939?

A. I haven't made it in connection with this. I probably did some figuring on Hutchinson County back in 1939 but it wasn't in connection with this study. I figured around on different parts of the field in connection with other things. I don't recall.

Q. Do you know of your own knowledge now whether or not Hutchinson County quadrants are decreasing at a faster rate than Moore County Quadrants or at a lower rate?

A. What part of Hutchinson County?

Q. Do you know whether or not all of Moore County has the pressures declining at a faster rate than Hutchinson County or have you given that any consideration.

A. I didn't include the whole county. I didn't consider —I included part of Hutchinson County in the Moore County area—or study it by county lines.

Q. Then you don't know?

A. No, sir.

Testimony of J. D. Thompson, Jr., Witness for Canadian.

Thompson prepared and sponsored Exhibit No. 187, entitled "Texas Panhandle Gas Field Rock Pressure Map, July, 1939." His direct testimony concerning this exhibit is contained in Volume LXVIII, pp. 9973-9980, and Exhibit 207, pp. 5, 6.

This exhibit shows the extent of the Texas Panhandle Field as outlined by the Railroad Commission. The exhibit further shows 20-pound interval contour or isobar bands, which show the rock pressure conditions existing as of July 31, 1939. These contour (isobar) lines and colored bands are based upon the official wellhead gauge pressures recorded by the Railroad Commission during the summer of 1939.

The following legend which is indicated on the map, shows by colors the wellhead pressure conditions as follows:

	Pounds
Gray	0-200
Orange	200-220
Dark Blue	220-240
Pink	240-260
Green	260-280
Red	280-300
Purple	300-320
Yellow-Green	320-340
Light-Blue	340-360
Brown	360-380
Salmon Pink	380-400
Yellow	Above 400

It will be noted that the areas colored gray, where wellhead gauge pressures are 200 pounds or less, are confined to or adjacent to those portions of the field which produce oil; that the areas colored yellow, where wellhead pressures are 400 pounds or above, are situated in localities remote from the oil producing portions of the field, and, as a result, are generally near the south and southwestern edges of the field.

Thompson stated that originally the entire field had a pressure of 430 pounds at the wellhead. The pressure dif-

ferential, as shown on the exhibit, is the result of progressive depletion of the gas reserves of the field due to gas withdrawals incident to the production of oil and for pipe line use.

The witness also said that in the early life of the field gas was largely regarded as a nuisance which handicapped the development of oil production. There was no market outlet for the gas itself and as a result tremendous quantities were wasted. The earliest producing areas to be developed in the field were the Borger area in south-central Hutchinson County and the Lefors area in central Gray County. In these two areas gas was encountered in pay formations above the oil bearing formations and little interest was taken in conserving this gas. It was frequently allowed to flow from the hole along with the oil and was thus entirely wasted into the air. This situation gave rise to the casinghead gasoline industry. The casinghead plants removed the gasoline content from this gas and popped or vented the residue into the air. Enormous amounts of gas were wasted in this manner. Later the carbon black industry came into the field and utilized this gas. These two industries were, therefore, firmly established and used tremendous quantities of gas from the oil producing areas before the major gas pipe lines were built. These early withdrawals from the oil field resulted in the establishment of the pressure differential picture set forth in Exhibit 187. Without question there has been a tremendous drainage of dry gas from that portion of the field which produces dry gas only to the low pressure oil producing areas due to the long established differential in pressure. That drainage has continued progressively from year to year and is effective today.

The witness on cross-examination testified that at this time there was no effective drainage from the East Panhandle Field to the West Panhandle Field but that the gas in the high pressure area in south Gray County was being depleted by drainage (Vol. LXXVI, pp. 11135-11136), however, a situation might develop where drainage would be possible due to the fact that the east field is losing its pressures rapidly and pipeline companies which are now getting their gas from Wheeler County might build an extension over into the west field and add to the withdrawals from the

west field which would have a tendency to equalize the pressures between the east field and the west field. (Vol. LXXVI, pp. 11136-11137.) Both the east and the west fields are contributing to the repressuring of the oil producing area shown by the gray color in Exhibit 187, in the area immediately north of the block fault in Gray County (Lefors area). (Vol. LXXVI, p. 11137.)

Drainage extends progressively out from a well to higher pressure areas by reason of the fact that gas moves in from the higher pressure areas in order to replace the gas which has been produced. (Vol. LXXVI, p. 11222.) Drainage is a progressive affair. Gas flows from an area of high pressure to an area of low pressure and eventually the effect is far-reaching. (Vol. LXXVI, p. 11224.) Witness, upon being questioned as to the possibility of a well of large open flow draining from the area which contains a well of a low open flow, replied: "Drainage is caused not by the open flow of the wells but by the pressure differential existing." (Vol. LXXVI, pp. 11234-11236.) Production from the wells in southwestern Hutchinson County contributes to the lowering of the pressure in that area and also contributes to the lowering of the pressure in the higher pressure areas to the southwest of them. (Vol. LXXVI, p. 11235.) Canadian wells in the area of southwestern Hutchinson County are not getting their full share of the gas but are only getting some of it as it goes by. The pressure contours change from year to year. There is always a very noticeable change with encroachment of the low pressure southwestward from Hutchinson County into Moore and Potter Counties. (Vol. LXXVI, p. 11242.) The wells in that area contribute to the falling pressures but are not solely responsible. (Vol. LXXVI, p. 11243.) There is no question but that gas is migrating (from Canadian acreage) to the northeast into the Borger-Sanford area. In fact the Borger-Sanford area is actually increasing in pressure notwithstanding the fact that substantial production of gas is occurring in that area. (Vol. LXXVI, p. 11244.) A comparison of the rock pressures in the Borger-Sanford area makes it quite apparent that these wells are building up substantially and if these wells were not receiving gas from an outside source their pressures would not be building up while they were producing (Vol. LXXVI, pp. 11244-11245), and this fact is very significant regardless of whether the

production rate is high or low. (Vol. LXXVI, p. 11246.) The Borger-Sanford area is outlined on Exhibit 187 by a red line. (Vol. XCIV, p. 14365.) Repressuring is now occurring over the entire distance between Borger and Sanford area some eight or nine miles and about two miles west and southwest of the town of Sanford. (Vol. LXXVII, pp. 11280, 11281.) There are very few wells, if any, within the Borger-Sanford area that are not being repressured. (Vol. LXXVII, p. 11285.) The point has finally been reached where gas is migrating into the area faster than it is being produced from the wells. (Vol. LXXVII, p. 11286.) Drainage has a very considerable influence on the shape of the isobars (pressure bands as shown on Exhibit 187.) (Vol. LXXVII, p. 11289.) The shape of the isobars would be different if there wasn't any drainage. (Vol. LXXVII, p. 11288.) Lowering pressures in any pressure band is due both to production of the wells and to drainage to lower pressure areas. It is inconceivable that it is due entirely to production. If it were due entirely to production you would have a series of concentric circles scattered all over the field showing the pressure distribution. This is not true, but on the contrary, you have a great wide sweep of pressure differentials extending from western Moore County across to the Borger and Sanford area. If there was no drainage the concentric circles would appear as is shown on a small isolated area in northwestern Potter County, which is a low pressure area entirely surrounded by higher pressure areas, and in that one area the loss in pressure is due entirely to the production from the one well in the center of the concentric circle and demonstrates that gas is going into the well from every side. (Vol. LXXVII, pp. 11310, 11311.) Drainage into the Borger-Sanford area is very substantial, the gas migrating rapidly enough not only to provide the gas that is being produced but additional volumes of gas. (Vol. LXXVII, p. 11297.) This gas is moving into the area from the higher pressure areas outside of it. (Vol. LXXVII, p. 11297.) These wells are getting more gas by migration than they are producing. (Vol. LXXVII, p. 11298.)

Referring to Exhibit 187, and particularly the Borger-Sanford area, the witness stated that the wells in the Borger-Sanford area which were being repressured are in the orange colored band partially, and it is quite obvious that they are

receiving gas—migratory gas—from the next higher pressured band, the blue band. The blue band, it is obvious, is receiving migratory gas from the pink band, being the one next higher in pressure. Gas displaced from the pink band into the dark blue band is draining the immediately surrounding green band, which is of higher pressure. That gas in turn is being replaced by gas from the red pressure band, which is the next higher in pressure. The matter of drainage is a progressive thing which extends band by band clear out into the extreme portions of the field which are showing pressure decline. The lowering of pressures is a combination of production of the wells through the area and in addition to this, migratory gas is draining from the high pressure area progressively to the low pressure area. (Vol. LXXVII, pp. 11299, 11300.) There are areas that are receiving gas by drainage; that is, migration, and the pressures are still decreasing, which means that such areas are not receiving gas as rapidly from drainage as the gas is being produced. (Vol. LXXVII, p. 11313.)

The witness had been cross examined at length with respect to the migration of gas into the Borger-Sanford area and had stated that there were eighty wells or more in the area in which the pressures were increasing, notwithstanding substantial production from the wells. He later determined that there were 126 wells in the area which were gaining in pressure. (Vol. XCIV, pp. 14362-14364.) These wells are listed upon Exhibit 259. (Vol. XCIV, p. 14363.) Exhibit 260, which is a companion exhibit to Exhibit 259, shows the production from the 126 wells for the year 1940. (Vol. XCIV, p. 14366.)

The production from these wells in 1940 was in excess of 34,000,000,000 cubic feet. The area outlined in Exhibit 187 and which has been referred to as the Borger-Sanford, contains approximately 20,000 acres. Assuming a production, therefore, of around 46,000,000,000 cubic feet for the year 1940 from Canadian acreage, the Borger-Sanford area is producing about three-fourths as much on an acreage basis as the entire Canadian acreage. The Canadian acreage is about twelve times as great as the acreage in the Borger-Sanford area, therefore the rate of production in the Borger-Sanford area is approximately eight times as great on an acreage basis, as the production from the Canadian

acreage, but notwithstanding this heavy rate of production the rock pressure in the Borger-Sanford area is actually increasing and obviously gas is migrating into that area from the surrounding areas of higher pressure. (Vol. XCIV, pp. 14366-14370.)

The Railroad Commission lists a total of 139 wells in the Borger-Sanford area. Thirteen of these wells were ignored because of an erratic pressure history. That is, the pressures fluctuated greatly from year to year and it was obvious that they were not dependable. (Vol. XCIV, pp. 14371, 14372.)

The witness, referring to Exhibit 187 and the pressure isobar bands, stated that gas was migrating out of Moore County and northeastern Potter County in the gneral direction of the Borger-Sanford area; that this picture is shown by the isobar bands on the map and that Commission's witness Hammer's isobar map, Exhibit 179, shows substantially the same thing. (Vol. XCIV, p. 14372.)

Witness also stated that there was a low pressure area extending straight west from the Borger-Sanford area through southern Moore County which he called a pressure ditch and that gas was migrating from both the north and south into this low pressure area and that the gas that was not produced by wells located in the area would necessarily continue to migrate to lower pressure areas in the general direction of Borger and Sanford area. (Vol. XCIV, pp. 14372, 14373.) The flow of gas shown by isobar lines is at right angles to such lines. Pressure differentials west of the Borger-Sanford area are represented by comparatively wide pressure bands, and indicate high permeability of the formations producing the gas and also indicate a comparatively free movement of gas in that area. Just south of the pressure ditch or low pressure area in Moore County the pressure bands in the Canadian acreage are wide which indicates a free movement of gas northward and northeastward, out of the Canadian acreage into the low pressure area of southern Moore County and toward the Borger-Sanford area. (Vol. XCIV, pp. 14374, 14375.)

If you have a tight formation of low porosity or of low permeability, or both, the migration of gas underground is restricted and where you have that situation the pressure

bands or isobar lines on pressure maps are narrow. (Vol. XCIV, p. 14375.)

Movement of gas underground may be rather rapid even though pressure differentials are slight if the permeability is high, for example, if you were taking gas out of one side of a large tank that is 100% permeable, you could get it all without any pressure differential at all and the greater your restriction, therefore, the greater would be your pressure differential and as your restriction becomes less and less, your pressure differentials would become less and less, and you would have a free movement of gas. (Vol. XCIV, pp. 14376, 14377.)

The fact that Canadian acreage in north Potter County and south Moore County is of low productivity does not prevent the free migration of gas because the low productivity may be due to thin pay formations which are permeable. You could still have considerable drainage under these conditions. There is conclusive evidence that this actually happened. The Canadian's Masterson B-5 well did not produce a foot of gas between July, 1939, and July, 1940, yet it lost eight pounds in pressure which is conclusive evidence that it is suffering drainage. This well is comparatively isolated, the nearest well to it being about two miles away and ranging up to six miles to the westward. (Vol. XCIV, pp. 14381-14383.)

Testimony of C. Don Hughes,
Witness for Canadian.

C. Don Hughes, whose qualifications have heretofore been given, testified (Vol. XCIV, pp. 14455-14461) with respect to drainage that Canadian acreage has suffered and is suffering currently, and in that connection he also testified with respect to the original and remaining reserves of the acreage of Canadian.

Hughes' estimates of Canadian reserves on a 16.4 pound pressure base, and after application of a 90 per cent recovery factor are as follows:

Original Reserves

At	0# gauge	3,126,553,265 Mcf.
	25	2,948,648,943
	50	2,763,945,524
	75	2,579,209,882
	100	2,401,337,783
	125	2,216,634,364

Remaining Reserves on 7-1-1932.

At	0# gauge	3,010,764,851 Mcf.
	25	2,832,860,529
	50	2,648,157,110
	75	2,643,421,468
	100	2,285,549,369
	125	2,100,945,950

Remaining Reserves on 8-1-1938.

At	0# gauge	2,793,264,821 Mcf.
	25	2,615,360,499
	50	2,430,657,080
	75	2,245,921,438
	100	2,068,049,339
	125	1,883,345,920

Remaining Reserves on 8-1-1939.

At	0# gauge	2,719,785,851 Mcf.
	25	2,541,8[illegible],529
	50	2,357,[illegible]8,110
	75	2,172,442,468
	100	1,994,570,369
	125	1,809,866,950

Hughes arrived at the original reserves of Canadian, hereinabove set out, by totaling the reserves of each tract owned by Canadian. He classified all of the Canadian leases, section by section, according to the approximate virgin natural open flow or potential. The potential of each section was then multiplied by the acres it contained and the product multiplied by his factor of .919211. This factor, as heretofore stated, represents the relationship between the approximate virgin natural open flow and reserves per acre in place.

The witness then determined the remaining reserves (as

distinguished from original reserves) by classifying each tract as to pressure existing on the dates hereinafter set out. The pressure was obtained from contour maps. The volume of gas remaining under each tract at each particular survey date was that portion of the original volume in place that the pressure on that particular date bore to the original virgin pressure of 430 pounds. The difference between the remaining volume of gas in place and the original volume of gas in place represents the amount of depletion the acreage has suffered, whether by actual production from the wells located on the acreage or by drainage to adjacent wells, or by a combination of both. The results of these calculations are as follows:

Date	Cumulative Production	Cumulative Depletion
July 1, 1932	94,416,252 Mcf.	115,788,414 Mcf.
August 1, 1938	282,094,343 Mcf.	333,288,444 Mcf.
August 1, 1939	322,364,196 Mcf.	406,767,414 Mcf.

The above tabulation demonstrates that the cumulative depletion has been greater than the cumulative production. The witness stated that it could be definitely concluded that as gas production from the area adjacent to the Canadian leases increases that the drainage will increase. In fact, it is the witness' opinion that the increase in the rate of drainage is just now becoming important. This increase in drainage is due to the increase in production during the last few years from the area adjacent to Canadian leases. It is important to recognize this increase in the rate of production and its effect on drainage in any consideration of the estimated reserves of gas in place under the Canadian leases. It is evident that Canadian will produce only a portion of the gas now in place under its leases.

The witness referred to the fact that from the beginning of production to August 1, 1939, there was produced from Canadian leases 322,364,196 Mcf. and that during the same period the total depletion was 406,767,414 Mcf. The production, therefore, was 79.3% of the total depletion which indicated a loss by drainage of 20.7%. During the period beginning August 1, 1938, and ending August 1, 1939, the depletion was 73,478,970 Mcf. and the production was 40,269,853 Mcf. The production, therefore, was only 54.8% of the total

depletion, which indicates a loss by drainage for this one year of 45.2%. All figures are computed on a 16.4 pound pressure base.

In making the estimates on Canadian leases, computations were made at various dates: 7-1-1932; 8-1-1938 and 8-1-1939. This carried the production performance of its leases back to a date where it is concluded that its withdrawals from its wells alone account for most of the pressure drops in its Area. At that date and on that assumption a factor could be found correlating open flow with reserves however, it results in a slightly smaller factor than Hughes' .919211 factor, but in his opinion, indicates that it is a reasonable factor.

Hughes testified on cross examination that in estimating the reserves of the Canadian, he employed the same method that he employed on the field as a whole; that is, he classified the acreage according to potential and then applied a factor to convert it into reserves in place. It is not a version of the pressure-decline method. The estimate of the Canadian reserves was in more detail since he determined the reserves section by section, each section containing approximately 640 acres. However, some tracts were smaller. Each tract was classified in accordance with the potentials. The study for the Canadian was made subsequent to the time that he prepared Exhibit 212, which was prepared about the first of the year 1939. At the time that he made the study on the Canadian reserves he obtained from the Company a list of all their wells with the open flow of each well converted to virgin rock pressure and corrections were also made for the various size pipe that had been used in the wells so that the figure represented the corrected virgin potential at 430 pounds and at a uniform pipe size. This was the most precise information that he had ever attempted to procure and since it was the latest information he had, he utilized it in making the section by section or tract by tract appraisal of the Canadian acreage. The open flows were corrected very carefully and there is some deviation in this respect from his map, Exhibit 212. The map, however, is not erroneous for the field as a whole because he had also checked it by appraising each section of the field and the figure was so near the figure that would be reached from a

consideration of his zone map that he had no occasion to change it. In other words, differences in open flows on the field as a whole average out pretty well. He could have used his zone map on the Canadian acreage but followed the tract by tract appraisal because he thought it was a little more accurate to do so. (Vol. XCIV, pp. 14477-14486.)

Many tracts over the Canadian acreage do not have wells upon them and these tracts were classified in the light of the nearest wells to them. There were very few sections that had more than one well on the section. There are a few such cases and those sections were not necessarily appraised as to the arithmetical average of the open flows but were appraised with respect to geological conditions in the area. There were a number of those that were considered in appraising a given tract before the actual open flow figure was determined, but if there was more than one well to a section the information on both wells was used; for example, if a section of land had two wells down on one side that were pretty good sized wells and immediately to the north in the next section there was a small well, naturally he wouldn't appraise that section that had the two good wells along the south line according to the arithmetical average potential of those two wells. The small well along the north line would have a bearing on the classification assigned to that particular section. (Vol. XCIV, pp. 14489-14492.) If the section had a well in the middle of it he would not necessarily appraise that section in accordance with the open flow of that particular well. He would be influenced somewhat by the size of the wells immediately around that section. The witness cannot remember precisely without referring to his working papers what he did in each case. The working papers consist of thirteen pages with about 40 entries on each page—in excess of 400 entries in all, and representing approximately 400 tracts of land. (Vol. XCIV, pp. 14493, 14494.) The witness has estimated the reserves on each tract and ... is of the opinion that he secured a correct picture by doing so. (Vol. XCIV, p. 14495.) In estimating reserves for the field as a whole Hughes obtained his remaining reserves at different dates by subtracting the production at the various dates from his estimate of original reserves. He could not do this in the case of Canadian

reserves by reason of drainage away from the acreage. He could do it for the entire field because the field as a whole has no drainage into or out of it. (Vol. XCIV, p. 14501.) The pressure-decline method would work in the field as a whole if you had the proper weighted average pressure; for example, if pressure was weighted on volume of gas in place rather than on acreage, but it does not give the correct answer on the field as a whole where weighted on surface areas alone. (Vol. XCIV, p. 14503.) The witness has assumed that he could apply Boyle's Law to determine the depletion from any particular tract because he had just determined the volume of that particular tract and the depletion would be in the proportion that the pressure of that tract, at the time of the study, bore to the original virgin pressure. (Vol. XCIV, pp. 14505-14508.)

The witness was then asked to compare the original virgin potentials corrected to casing sizes furnished to him by Canadian with the initial potentials of some wells as described by the well logs, which in some cases varied from the figure shown on the well logs. The witness explained that there could very easily be a difference in some cases because frequently the potentials shown on well logs were estimates and were not actual gauges and certainly the well logs would not offer nearly as accurate information as the data which he actually used. He utilized the corrected potentials given to him by the company and he had no reason to question the accuracy of the data furnished. (Vol. XCV, pp. 14511-14518.) Witness also explained somewhat in detail the appraisal of various tracts in accordance with their proximity to the fault line, some of which were below the fault line of the Railroad Commission and some of which were partially below the fault line of the Railroad Commission, and he also explained in detail the effect that surrounding wells have as to the appraisal of a particular tract, and also the influence that acidization or shooting of a well in order to get a higher potential would have on his appraisal. Sometimes the appraisal would be higher and sometimes lower and if the witness had arrived at a higher estimate of Canadian reserves than he did, that this within itself would have shown greater drainage away from the Canadian acreage than his figures do show. (Vol. XCV, pp. 14519-14542.) The witness did not use the open flows as shown on the well logs

because his primary concern was to get the most correct and the latest available information on each well. If later developments showed, as it does in many cases, that the open flow shown on the well log was an erroneous figure, he would have been in error by shutting his eyes to this situation and using a figure taken from the well log, knowing that the figure was an erroneous one. (Vol. XCV, p. 14547.)

The Commission's counsel had marked for identification Exhibit 279, Hughes' working papers, showing the corrected potential used in estimating Canadian reserves, pages 1, 2, 3 and 4. They also had marked for identification Exhibit 280, the working papers of Hughes, page 1 through 13, showing the calculations made as to each tract. (Vol. XCV, p. 14551.) Pressures of different tracts were estimated from the slope of the pressure pattern at that particular point. There were some tracts where the pressures would be uniform throughout and others where the pressure would not be uniform, depending upon the pressure pattern. The actual pressure on each tract was determined by contouring the pressures in the area. The witness utilized a pressure contour map for each of the periods for which the reserve was estimated. The 1939 pressures were taken from Thompson's pressure map, Exhibit 187. (Vol. XCV, pp. 14553, 14563.) The drainage that Canadian has suffered has gone to areas where the pressures were lower than that obtaining in the Canadian acreage (Vol. XCV, pp. 14563, 14564), which would be northeast toward the Sanford and Borger area. (Vol. XCV, p. 14568.) If Canadian had suffered no drainage at all up through 1932 then that would be a very definite indication that the witness' pressure factor of .919211 was too high. If he then corrected his factor and applied a lower figure this would result in a lower estimate of reserves. (Vol. XCV, pp. 14569-14571.)

The witness stated that it was silly to attempt to point to a single well to which gas drained from the Canadian acreage but he did know that the gas drained to areas of lower pressure. The wells in the lower pressure areas are the ones that receive the gas. The lower pressure areas to the northeast receive gas from the Canadian acreage because the nearest low pressure areas were to the northeast and in the Borger and Sanford area. (Vol. XCV, pp. 14574.

14575.) Some of the wells in the Borger-Sanford area have produced staggering volumes of gas and the fact that some of the Canadian Wells in the southwest portion of Hutchinson County produced large quantities of gas resulted merely in those wells getting some of the gas as it went by toward the low pressure area to the northeast around Sanford. (Vol. XCV, pp. 14578-14580.) Gas migrates from areas of high pressure to areas of low pressure, and referring to Exhibit 239, gas would migrate from the yellow area, which is the highest pressure color, to the orange, which is the next lower pressure group, and from the orange to the blue, and from the blue to the green, toward Hutchinson County. That is the only conclusion you can make from the pressure conditions existing. (Vol. XCV, pp. 14588, 14589.) It is the witness' opinion that the Canadian acreage was suffering drainage subsequent to January, 1937, and also that the net effect was drainage away from Canadian acreage for the period from 1932 to 1938. There might be some areas which would be receiving gas as a result of drainage into it but there are certain other areas in which their leases were suffering from drainage during all those years. (Vol. XCV, pp. 14600-14602.) The pressure map for 1934, Exhibit 239, shows that there was a low pressure area around Borger and Sanford and high pressures existed to the southwest into the Canadian acreage. Therefore, the map would indicate that drainage was being experienced from the higher pressure leases of the Canadian located in the area of northeast Potter County, southeast Moore County and northwest Carson County. It is impossible to name a particular well that received the gas that drained away from Canadian acreage but one of the wells was likely the Polo well in the Sanford area which the witness stated had produced fifteen billion cubic feet of gas from one ten-acre lease at the time he made his study. (Vol. XCV, pp. 14602, 14603.) The Polo well is one of the outstanding examples of large production in the area referred to and that anyone familiar with the Sanford area is familiar with the enormous production of this well. The witness does not recall just what period this covered but he thinks it covered the period prior to about 1934 or 1935 and the early production from this well is not reflected by the Railroad Commission's records. No one would contend that any acreage in the Texas

Panhandle Field had as much as a billion and a half cubic feet per acre, which is what this well had produced. (Vol. XCV, pp. 14605, 14609.) The witness reiterated that drainage from Canadian acreage was in the direction of the areas of lower pressure which generally was to the northeast. That one or two wells didn't get all of the gas but the wells that are located between the area of the Canadian leases and the lowest pressure areas obtained it. It is entirely possible that some of the gas has migrated away from the Canadian leases hasn't even been produced yet. (Vol. XCV, pp. 14612, 14613.) The gas that has been lost by Canadian acreage could have been produced by all of the wells that are located in areas of lower pressure. The wells in the very lowest pressure area, which are producing gas without loss of pressure in the Borger-Sanford area, are merely picking up the final bit of gas that has reached that area. Much of the gas that started toward that general area was produced by other wells along the way. (Vol. XCV, pp. 14615, 14616.) Canadian wells alone in the northeast part of their reserves did not produce the gas that migrated from Canadian acreage. If that had been true you would have had a bunch of "sink holes" around those wells (concentric pressure bands). The fact that wells in the Borger-Sanford area began to increase in pressure as their production was retarded makes no difference with respect to the question of drainage; whether the Sanford production was increasing or not, drainage is going into that area, because while the pressures were increasing the wells were actually producing large volumes of gas. If the pressures were static this would still prove that drainage is taking place in view of the production from the wells. If the production is later increased from those wells and the pressures start going down again (Borger-Sanford area) they would still be receiving gas by drainage as long as the high pressure areas continue to exist back to the southwest. It is very likely true that the wells in the Borger-Sanford area are being repressured by local movement of gas into that area but as gas moves from the adjacent area into the next lower pressure area, gas from the next higher pressure area moves in to replace it and "local drainage" finally becomes long distance drainage. The pressures in southwest Hutchinson County have been maintained to a degree, notwith-

standing loss of gas by drainage into the Sanford area, because the higher pressure areas to the southwest are also furnishing gas to this area. (Vol. XCV, pp. 14619, 14622.)

Testimony of STANLEY GILL, Witness for Canadian.

Stanley Gill, witness for Canadian, whose qualifications have been stated heretofore, testified on the subject of drainage generally and particularly as it affected Canadian reserves. His testimony on direct examination may be found in Volume XCI, pp. 14023-14027.

Estimation of reserves of recoverable gas is obviously of fundamental importance in determining the future value of a group of gas-producing properties as a source of supply for a major pipe line system. However, reserve of gas in place is not by any means the only factor to be considered in investigating the future life of such gas-producing properties. As a whole, the solution of the problem for a given case involves many factors, but it can be resolved into a few simple elements. These elements relate to both physical and economic factors and are concerned not only with the particular properties under consideration, but also with the effect upon them of operations on other properties withdrawing gas from a common reservoir. These factors are of controlling importance in the Texas Panhandle Field in the case of properties producing gas to supply trunk pipe lines. (Exhibit 265, p. 41.)

It is an inescapable conclusion that the future productive life of wells and properties serving a trunk pipe line will be far more closely related to reserves and withdrawals of gas from the field as a whole than to reserves and future withdrawals from the specific properties in question. The Texas Panhandle gas reservoir constitutes essentially a single inter-connected system of porosity. Although there are differences in thickness and physical characteristics of the reservoir rock in different parts of the field and vertically through the reservoir system, the reservoir in a broad sense is definitely a single system, permeably inter-connected throughout. Therefore, withdrawals of gas from any part of the reservoir will affect, materially, the gas lying under other far distant parts of the field. Not only do such withdrawals bring about extensive drainage, but they are of im-

portance in controlling future trends of withdrawals. For example, heavy withdrawals of gas from Wheeler County may be expected to lead to premature reduction of pressure, and to a shift of withdrawals into the sweet gas area of Moore County. For a similar reason future heavy withdrawals may be anticipated from what is now a sparsely developed high-pressure sour gas area in Moore and Hartley Counties. (Exhibit 265, pp. 41-42.)

Because of the physical characteristics of gas, it is theoretically possible that a single gas well could eventually drain substantially all of the gas out of the Texas Panhandle Reservoir. This theoretical possibility is of course a practical absurdity because of the great time that would be required, but the reservoir characteristics, which make this theoretically possible, have had a tremendous influence on the performance of the field in the past and will continue to be of controlling importance down to the very end of its producing life. The effects of drainage of gas have been of particular importance in the Texas Panhandle Field because of the manner in which developments have been carried out and the manner in which withdrawals of gas have been distributed. The reasons for concentration of withdrawals along the northern flanks of the structure are so familiar that they need not be described. This concentration of withdrawals established, early in the life of the field, great trends of drainage, which were apparent in the very earliest pressure surveys and which have continued down to the present time. Gas has drained generally toward the north, from the high-pressure sweet gas areas, since the very beginning of oil development in the field, and this drainage may be expected to continue. In some parts of the field, and particularly in Moore County, it is reasonable to anticipate increased development of low pressures in the sour gas area in the future. (Exhibit 265, pp. 42-43.)

During the future producing life of the field, drainage from high-pressure areas to replenish the low-pressure areas will unquestionably continue, since withdrawals of gas from high-pressure sweet gas areas will be limited by the pipe line outlet and will be less in proportion to the high rates of withdrawal in the sour gas area. The conclusion that high-pressure sweet gas acreage will lose tremendous quantities of gas by drainage during future years is absolutely inescapable. (Exhibit 265, p. 43.)

It must be concluded that the future life of gas-producing properties serving gas pipe lines will be determined, not primarily by the reserves of gas which originally underlaid the particular properties or which now underlie them, nor by the future rates of withdrawal of gas from the particular properties in question. Rather, the future life of these properties will be determined by the total reserve of producible gas remaining in the field and by the future rates of withdrawal of this gas for all purposes, not only through wells on the particular properties under consideration, but through all of the wells in the field, wherever they may be located. There will be of course numerous minor exceptions to this generalized conclusion, but its validity as related to any considerable group of gas-producing properties in the Texas Panhandle Field is beyond question. (Exhibit 265, pp. 43-44.)

The situation of the Canadian properties in the field, and the effect upon them of present drainage and of the future drainage trends that may be expected to develop as withdrawals of both sweet and sour gas shift from other parts of the field to Moore County, make the foregoing statement particularly relevant when related to Canadian's holdings. (Exhibit 265, p. 44.)

Additional Canadian
Evidence on Drainage

Gill for the purpose of this study took into consideration all of the information and data set forth in his previous written statement (Exhibit 265) including all of the exhibits and testimony referred to therein, as well as the Commission's Exhibit No. 95 showing the acreage of Canadian in the Texas Panhandle Field. The word "drainage" as used by the witness means the general sub-surface migration of gas by reason of differentials in reservoir pressures within a given field.

The witness' testimony, with respect to the above matters appearing hereinafter, is contained in Volume XCI, pages 14031 to 14049, and in the written statement of Exhibit 266.

Gill stated that drainage inevitably takes place in a gas reservoir comprising an inter-connected porous system, between the various parts of which differences in pressure exist. Because of the low viscosity of gas, such drainage

takes place over very long distances and through formations of relatively low permeability. The gas reservoir of the Texas Panhandle Field is definitely a completely inter-connected porous system, and great pressure differentials were established early in the life of the field as a result of intensive development and production in the oil-producing areas. Subsequent operations, and particularly the withdrawals of sour gas and casinghead gas, have maintained these pressure differentials. The differences in per-acre withdrawal rates that originally established pressure gradients in the Texas Panhandle Field may be expected to continue. This expectation, as it bears upon properties in the western part of the Texas Panhandle Field, has been discussed by Massa in his Exhibit 256. (Exhibit 266, pp. 2-3.)

That the regional pressure gradients in the Texas Panhandle Field have actually brought about sub-surface migration of gas on a tremendous scale, resulting in great drainage of gas from large areas, becomes apparent upon examination of available factual data. This conclusion is grounded upon, and is positively supported by, four lines of analysis of the facts as to field performance:

1. The sequence of development of low-pressure areas from year to year, which is graphically illustrated in the series of isobar maps submitted by Dunlap (Exhibit No. 239), shows the consistent migration of gas into areas of low pressure, and the consequent reduction of pressures in areas of higher pressure.

2. That gas is draining into areas from which there have been heavy withdrawals of gas is conclusively demonstrated by the fact that pressures in such areas have been maintained in the face of continued withdrawals. In some large areas there has actually been an increase in pressure during recent years, despite the fact that substantial quantities of gas have been produced out of them during the period of pressure build-up. Specific data on this maintenance and build-up of pressure are contained in Massa's Exhibits No. 259 and 260.

3. As new wells are completed in the field, they encounter gas at pressures materially lower than virgin reservoir pressure, which is the direct result of prior withdrawals of gas out of other wells in the field.

4. Past pressure declines and past withdrawals of gas as between different parts of the field are definitely related to each other in such a manner as to show that extensive drainage of gas over long distance has taken place. (Exhibit 266, pp. 3-4.)

The most conclusive demonstration of definite regional drainage trends is found in the progressive changes of the field pressure pattern. Major trends of drainage are apparent from an analysis of the series of field isobar maps which were submitted by Dunlap as Exhibit No. 239. For example, the growth of a low-pressure area, resulting from drainage into the Borger-Sanford area, is very apparent from these maps. From year to year this low-pressure area has extended farther and farther to the west and southwest into Moore and Potter Counties. Up to about 1937, nosing of low-pressure contours into this area was caused almost entirely by drainage of gas into the Borger-Sanford area. Since that time the rate of production out of the Moore County and Potter County sweet gas area has increased, but rates of withdrawal of gas out of this area are still much lower in proportion to gas reserves than are withdrawals of sour gas out of the Borger-Sanford area. Continued extension of this low-pressure area since 1937 is definitely shown by the maps and is, to a great extent, the result of continued drainage of gas into the Borger-Sanford areas. (Exhibit 266, pp. 4-5.)

The Dunlap maps (Exhibit 239) also show an important drainage trend in northwestern Moore County. Beginning in 1935, a low-pressure area developed in this section of the field as a result of heavy gas withdrawals. The growth of this low-pressure area from year to year, and the extension of the low-pressure contours into the sweet gas field, are very apparent from the isobar maps. By 1940, drainage into northwestern Moore County had affected a very considerable area, as shown by the 350-pound contour. The low-pressure area from northwestern Moore County had almost met the low-pressure area resulting from drainage into the Borger-Sanford area. It is interesting to note that the development of these low-pressure areas has followed, in general, the zone of high productivity shown on Hughes' map, Exhibit No. 212. (Exhibit 266, p. 5.)

The effects of drainage are also strikingly apparent in the

pressure changes that have taken place in Carson County. There have been heavy withdrawals of gas along the northern part of the field in Hutchinson and northeastern Carson Counties. Withdrawals from the southern and western parts of the field in Carson County have been far lower in proportion to reserves. The progressive development of low pressures in this part of Carson County is evident from the pressure maps. Each map, when compared to that of the previous year, shows that there is rapid development of low pressures. It is significant also that in northeastern Carson County, the area having a pressure of less than 200 pounds has not increased in size since 1938, and that the area having pressures of less than 250 pounds has not shown any great increase in size. The significance of the above condition is, that long-distance drainage from higher-pressure areas is providing gas to the gray and orange colored bands (Exhibit No. 239), to the extent that the pressure drop in these bands is being retarded. Large quantities of gas are still being withdrawn from these areas, but as pressure differentials are set up across the field, gas is moving from long distances to replenish the depleted pay formations. (Exhibit 266, pp. 5-6.)

The fact that pressure gradients develop rapidly as a result of drainage is shown on Dunlap's maps, Exhibit No. 239, by the early pressure performance in Gray and Wheeler Counties. The map for 1934 shows a large area colored in brown in these counties, having rock pressures between 350 and 400 pounds. In the succeeding years the brown color is replaced with colors of lower pressures across the entire width of the field in these counties. Dunlap's map for 1940 shows a large area having rock pressures of 350 to 400 pounds in Moore and Potter Counties. It is to be expected that in future years, with the continuation of heavy withdrawals out of the Borger-Sanford area of southwestern Hutchinson County, pressure performance in this area will be similar to that which was the case in Wheeler and Gray Counties, and that increasing pressure differentials will be set up. Massa's Exhibit No. 256, which discusses the factors that will lead to a shift of production to the western portion of the Texas Panhandle Field, lends emphasis to the probability of this pressure differential becoming a very serious problem in this area. (Exhibit 266, pp. 6-7.)

An interesting comparison can also be made between the isobar maps (Exhibit No. 239) and the curves contained in Massa's Exhibit No. 257. These curves indicate that up until 1937, the production out of wells located in the Canadian Area was almost sufficient to account for the pressure drop which had occurred. Beginning in 1937, pressures in this area began to decline at a far more rapid rate, apparently because material sub-surface drainage out of the area began at about that time. This opinion arrived at by Massa as a result of study of the pressure-production relationship, is corroborated by the isobar lines on the maps submitted by Dunlap. (Exhibit 266, p. 7.)

Reference to Hammer's pressure map (Exhibit No. 179) shows that drainage from southern Moore County and from Potter County is in the direction of the Borger-Sanford area. The pressure bands to the west and southwest of Sanford are comparatively wide. This indicates that there is no effective barrier against long distance drainage. That this condition exists is also emphasized by reference to Hughes' map showing zones of productivity, which indicates that wells in the area southwest of Sanford are in a highly productive area and in an area where the permeability is comparatively high. The drainage condition above referred to is further substantiated by the results of Thompson's study (Exhibit No. 187), which shows that in spite of large production from wells in the Borger-Sanford area, pressures in this area during the past several years are higher than in 1935 and 1936. When pressure differentials are established, as shown by Hammer's map, the inevitable conclusion is that migration of gas will occur over long distances. (Exhibit 266, p. 8.)

It is to be expected that a low-pressure area of major consequence will develop along the western end of the field as the sour gas area in Moore and Hartley Counties is developed. The low pressures in this sour gas area will develop like the low-pressure area in northwestern Moore County, the rapid and progressive growth of which since 1935 is very clearly shown by Dunlap's maps (Exhibit 239). Massa has pointed out in Exhibit No. 256 that the high pressures in this sour gas area will provide the incentive for a rapid extension of sour gas operations into it. Due to the fact that wells of low productivity are to be expected in this area, it appears

probable that pressures will decline there rapidly once withdrawals are started, and that a low-pressure area of considerable size will develop. (Exhibit 266, pp. 8-9.)

The combined effect of continued drainage and of original differences in gas content of different parts of the Panhandle Reservoir is very clearly illustrated by the results of a study of the West Panhandle Field, which was made by witness during 1938. As a basis for this study, estimated withdrawals of gas from the discovery of the field down to January 1, 1938, were geographically allocated to the sections of the West Panhandle Field from which the gas had actually been produced. Although this process involved a great amount of estimation and assumption, it is believed that the final allocation was reasonably accurate. From rock pressure survey data of the Railroad Commission, losses of rock pressure from an assumed original rock pressure of 430 pounds were determined and a map of the West Panhandle Field was contoured with lines of equal rock pressure loss, 20-pound intervals being used. The areas of these zones of equal pressure loss were measured by planimetering, and the amount of gas that had been removed from the reservoir out of wells located in each of the zones was determined from the withdrawal allocation estimates previously described. Production per acre-pound out of each of the zones was then calculated. Results of this calculation as shown in the following table are plotted on a curve attached to Exhibit 266.

Loss of rock pressure from original 430 pounds	Area in Acres	Production to 1/1/38, MMCF. per Ac.-Lb.	Recovery per Ac.-Lb. as percentage of field average yield
0 - 10	124,665	0.0057	8.7%
10 - 30	347,803	0.01443	21.9
30 - 50	216,110	0.0393	59.5
50 - 70	67,437	0.0519	78.6
70 - 90	35,383	0.0264	40.0
90 - 110	32,677	0.0184	27.9
110 - 130	33,715	0.0194	29.1
130 - 150	27,803	0.0149	22.6
150 - 170	28,114	0.0301	45.6
170 - 190	28,535	0.0644	97.5
190 - 210	32,706	0.0522	79.1
210 - 230	24,840	0.133	201.7
230 - 250	19,758	0.0932	141.2
250 - 270	10.653	0.1251	189.8
270 - 290	16,548	0.1788	270.5
290 - 310	6,468	0.1110	168.2
310 - 330	7,335	0.1810	274.5
Over 330	8,506	0.2335	353.5

(Exhibit 266, pp. 9-10.)

The fact that actual recoveries per acre-pound out of the West Panhandle Field have varied over a range of nearly 40 to 1, and that these recoveries have varied continuously and regularly across the field, is strikingly apparent from these data. In effect, the data show the relationship between gas recovered through wells located in the particular areas, and pressure declines which are the combined result of such recoveries out of wells and of losses or gains of gas by subsurface drainage. (Exhibit 266, pp. 10-11.)

Similar disparities in recovery rates for the period August 1, 1935, to August 1, 1939, are reflected in the basic figures used by Hammer for his estimates of reserves of gas (Exhibit No. 180). Results of calculations made by witness from Hammer's basic data for his individual "quadrants" in the western part of the Texas Panhandle Field are tabulated below:

Hammer's "Quadrant" (Exhibit No. 179)	Area in Acres	Production 8/1/35-8/1/38, MMCF./Ac.-Lb.	Recovery per Ac.-Lb. as percentage of average for entire group
Hartley*	32,906	0.03672	64.5%
Potter I*	57,588	0.03888	68.4
Potter II*	44,937	0.02924	51.4
Potter III*	33,389	0.04006	70.5
Moore I*	62,173	0.06249	108.1
Moore II*	61,866	0.03487	61.4
Moore III*	56,614	0.03104	54.6
Moore IV	28,775	0.00854	15.0
Moore V	62,614	0.02134	37.5
Moore VI	79,556	0.03428	60.4
Moore VII	65,530	0.09296	163.7
Moore VIII	29,198	0.11054	195.2
Hutchinson I	9,660	0 35868	632.
Hutchinson II	50,658	0.22683	399.
Hutchinson III*	53,967	0.13077	229.5
Hutchinson IV	46,157	0.00744	13.1
Hutchinson V	35,097	0.01041	183.3
Carson I	52,814	0.00854	15.0
Carson II	82,997	0.09503	167.3
Carson III	79,985	0.05468	96.2
Carson IV*	40,251	0.05514	97.5

*"Quadrants" in which Canadian acreage is located.

Due to the configuration of Hammer's "quadrants," these figures fail to reflect the full, actual variations in recoveries between different parts of the producing area. Even so, the extreme ratio of 48 to 1 between the high and low "quadrants" proves definitely that sub-surface migration on a large scale took place during the period considered. (Exhibit 266, pp. 11-11a.)

The figures arrived at in both of the above studies reflect the effects both of drainage and of original differences in reservoir content. If it could be assumed that the original reservoir content expressed in terms of total gas per acre was the same in all parts of the field, these figures could be used to obtain a quantitative expression of the drainage that

had occurred into and out of the zones of pressure loss up to the time when the study was made. (Exhibit 266, p. 11a.)

Since original per-acre reserves in the Texas Panhandle Field varied widely as between different parts of its area, such a quantitative calculation cannot be made from the figures given in the table. However, these figures demonstrate conclusively that drainage is a major factor to be considered in estimating the future life of the high-pressure gas reserves from which the gas pipe lines are supplied. (Exhibit 266, p. 11a.)

Remaining Life of Gas Reserves of Canadian in Texas Panhandle Field as a Source of Supply for Long Distance Pipe Lines

Testimony of STANLEY GILL, Witness for Canadian.

The witness' general opinions as to the factors determining the economic life of gas reserves serving trunk pipe lines in the Texas Panhandle Field, were presented in his written statement, Exhibit No. 265. His conclusions as to these factors are re-stated in the introduction to this statement on the actual effects of drainage of gas in the Texas Panhandle Field. He is very definitely of the opinion that the useful life of Canadian's gas reserves in the Texas Panhandle Field, as a source of supply for transmission through their lines to distant markets, will be determined to a controlling extent by sub-surface drainage of gas from beneath their properties. This conclusion rests upon the probability, amounting practically to a certainty, that per-acre rates of withdrawal out of Canadian's acreage to meet their pipe line requirements, will continue to be materially lower than per-acre rates of withdrawal out of other parts of the West Panhandle Field. This conclusion is supported by the fact that this acreage is now and will continue to be affected by extensive sub-surface drainage at an accelerating rate. Because of these conditions, he believes that for all practical purposes the economic life of Canadian's gas-producing properties in the Texas Panhandle Field will closely approximate the economic producing life of the field as a whole, and will bear but little relationship to the quantities of gas which may currently underlie Canadian's leases. While it is probably true that pressures in the area operated by

Canadian will be somewhat higher than the field average, down to the very end of their producing operations, it is equally true that abandonment of operations designed to serve a trunk pipe line system will be higher than the average abandonment pressure for the field as a whole, because of the economic factors controlling pipe line operations. Therefore, it seems to the witness very reasonable to assume that the economic life of Canadian's reserves will be determined by the economic life of the Texas Panhandle Field as a whole. (Exhibit 266, pp. 11a, 12, 13.)

Gill stated that by reason of the foregoing, it is his opinion that Canadian will be unable, economically, to supply all of its anticipated market requirements from its gas reserves in the Texas Panhandle Field beyond the year 1951, but that it will be able to supply a portion of such markets at declining rates until about the year 1956, when the economic life of the property for the purposes required by Canadian will definitely terminate. This conclusion on the part of the witness is modified only by his opinion that the economic limitation on development and the economic limitation on producing operations may very probably be reached before the dates stated. (Exhibit 266, p. 14.)

Gill testified on cross examination that the life of the Canadian reserves are far more closely related to the total life of the field than to the quantities of gas currently in place under their particular properties. The witness stated that it would be physically possible for Canadian to recover all of the gas currently in place under their properties by blowing the gas into the air, but as a practical matter they will not ever recover the quantity of recoverable gas which now exists under their properties. The witness stated that Hammer, Commission witness, might have the idea that it would be physically possible for Canadian to recover the volume of gas under its properties, and it may be physically possible for it to do so, but from a practical situation such an assumption is sophistry of the wildest sort. The witness further stated that if he desired to indulge in pure sophistry he would say that Canadian could recover all of its recoverable gas now under its property but it would be necessary for them to drill a lot of wells and blow a tremendous quantity of gas into the air. That as a practical matter Canadian would never recover anywhere near all of the

quantity of gas which now exists under its properties. (Vol. XCIII, pp. 14264, 14266-14269.)

The witness has examined the individual pressure performance of some of Canadian's wells and has examined in some detail the performance of pressures over the Canadian Area as a whole from year to year, and he has related withdrawal pressure performance in the Area involved to withdrawal pressure performance in other parts of the field on production and pressure performance from the beginning down to January 1, 1938. His study has been made not so much with respect to particular wells but with respect to the isobaric contourings of the area which were determined by the pressures of individual wells. The witness has not followed the pressures through from year to year on a specific well because that isn't the important thing. The important thing is the pressure in the area as reflected by proper isobaric contours which is of significance. He has constructed pressure maps of the Texas Panhandle Field at various times and to that extent he has considered the pressures of all the wells. (Vol. XCIII, pp. 14295, 14296.) Upon being asked whether he thought that Canadian could recover all of the gas under its acreage by the present wells within a reasonable length of time he replied that he did not think it would ever recover all of the gas under its acreage out of existing wells, or out of existing wells combined with any wells they might drill. As a practical matter Canadian will never recover anywhere near the quantity of gas which now underlies their leases in the Texas Panhandle Field. The question of how much gas can be recovered out of a given existing group of wells is a question of the period of time involved. Canadian will have to drill additional wells in order to hold their potential production, their open flow, up to a point where it can meet its daily demands. It will have to drill additional wells in order to recover and utilize the quantity of gas which it will eventually recover out of the property which will be much less than the quantity of gas that now underlies the property. Additional wells will necessarily be drilled, not for the purpose of adding anything to the quantity of gas existing under the property, because this would not do it, but of adding to the daily producing ability which Canadian must have to meet its market demands. (Vol. XCIII, pp. 14316, 14317.)

The witness stated that in making an estimate of the

future expectancy of the wells of Canadian it would be necessary to study the probable future life of the Texas Panhandle Field as a whole. (Vol. XCVIII, pp. 14334, 14335.)

The witness reiterated the statement made in his direct testimony that if given a sufficiently long period of time a single well could drain all of the recoverable gas out of any permeably inter-connected porous system, even though the size of the system was as great as that of the Texas Panhandle Field, and that the reservoir characteristics which makes this theoretically possible have had a tremendous influence on the performance of the field in the past and would be of controlling importance down to the very end of its producing life. (Vol. XCIII, p. 14321.)

Gill then was referred to the series of pressure maps prepared by Dunlap (Exhibit 239). He was then asked if he had studied the individual production from individual wells in each one of the pressure bands to ascertain whether or not the movement of the particular pressure bands from year to year is due to drainage or production within the area. The witness replied that he had not made a specific study band by band as to those particular maps but that he had made those studies generally in the field and was thoroughly familiar with the general facts as to the gas withdrawals. He has studied the withdrawals from various parts of the field in sufficient detail to state very definitely that the pressure changes, as reflected by the maps, are caused by drainage. His only detailed study with respect to pressure bands and the movement of the same, is summarized in the written statement in Exhibit 266 and in the table on page 10. The witness stated in his direct testimony, as shown by page 10 of Exhibit 266, and the table in connection therewith, that actual recoveries per acre pound out of the West Panhandle Field have varied over a range of nearly forty to one, and that these recoveries have varied continuously and regularly across the field. The data contained in the table shows the relationship between gas recovered in various pressure bands. It will be noted that where the loss in pressure, for example, has been only ten pounds, the recovery per acre pound has been only 8.7% of the average yield for the field as a whole, and where the loss in pressure has been over 330 pounds, the

recovery per acre pound has been 353.5% of the average yield for the field. In other words, the lowest pressure area in the field has recovered approximately forty times as much gas per acre pound loss in pressure as the highest pressure area in the field. The witness stated that much of this discrepancy in the rates of recovery is due to subsurface drainage of gas. (Exhibit 266, p. 10.) Slight changes in the form of the pressure contour bands (isobars) on the Railroad Commission's maps from year to year is of very little importance. The important thing is the general trend as shown by the large features as to pressure changes. Looking at the entire series of maps there is shown a great over-all eating back of a low pressure area into Moore and Potter Counties from the Borger-Sanford area. This indicates a great drainage trend, although there have been local effects within the area. It is entirely possible that some portions of Canadian acreage would pick up some gas out of other parts of Canadian acreage. The high pressure area in Potter County represents acreage of Canadian from which much of the drainage would necessarily come. The witness has made a study to determine physically the cause of the over-all sequence of development of low pressure back into Moore and Potter Counties. Very definitely that general over-all development is occasioned by the large regional drainage of gas out of that area into the area of very heavy withdrawals which lie generally in southwestern Hutchinson County. The tabulation on page 10, Exhibit 266, (hereinabove referred to) shows very positively that the Canadian acreage in Potter and Moore Counties has suffered extensive drainage. (Vol. XCIX, pp. 15295-15300, 15325.)

Gill stated that Dunlap's series of pressure maps, Exhibit 239, do show exactly what has taken place when considered in general as to broad details which reflect the trends of drainage in the sequences that are shown from year to year. The series of maps show very well and very thoroughly that drainage has occurred. (Vol. XCIX, p. 15302.) Witness again reiterated that the study of individual wells would have no bearing with respect to the question of regional drainage. It is true that the gas that was withdrawn came out of individual wells, but it is the average withdrawals over large geographical units that prove conclusively that the extension of low pressure back into Moore and Potter Counties is the result of drainage of those areas. The low

pressure area extending out from the Borger-Sanford area didn't reach over into Potter County instantly. The effective drainage into the Borger-Sanford area was beginning to show up in Potter County along about 1937. (Vol. XCIX, pp. 15307, 15308.) . The witness stated that he had made a particular study as to the general accumulated per-acre withdrawals averaged over the areas included in various pressure bands and this showed conclusively that the extension of the low pressure area in pressures of less than 400 pounds which had extended into Potter and southern Moore Counties over a period of years resulted primarily from drainage of gas out of Potter and southern Moore Counties rather than from withdrawals of gas out of wells located within those areas. The general extension of low pressure contours in a southwesterly direction outward from the Borger-Sanford area has resulted primarily from drainage of gas out of Potter and Moore Counties rather than from withdrawals of gas out of wells located within those areas. The general extension of low pressure contours—in a southwesterly direction outward from the Borger-Sanford area has resulted primarily from drainage of gas out of Potter and Moore Counties toward the lower pressure areas. (Vol. XCIX, pp. 15310-15312.)

The witness further stated that the pressure decline of practically every well lying in southeastern Moore County and in southwestern Hutchinson County has been influenced by drainage of gas out of Potter County acreage. This does not mean that a cubic foot of gas that originally lay in Potter County has moved on over and come out of a well in the Sanford area. It does mean that gas which was originally close to that well in the Sanford area has been moved toward the well by expansion which carried back from pressure band to pressure band and which ties into expansion of gas over into Potter County and drainage of gas out of Potter County. (Vol. XCIX, pp. 15314, 15315.) It is obvious that gas is draining into the Sanford area as reflected by the increase in pressures of many wells in that area since 1935. (Vol. XCIX, pp. 15316, 15317.)

The witness was then asked if it was not true that if there was any drainage out of Canadian acreage it would be out of that portion of its acreage located in the southwestern part of Hutchinson County. The witness replied that there

undoubtedly was drainage out of such acreage but at the same time the acreage was receiving extensive replenishment of gas as a result of drainage from the southwest, and it was losing gas extensively to the northeast. Canadian leases in southwestern Hutchinson County show a general decline in pressure. The replenishment from the southwest has been less in total effect than the combined effect of production and drainage loss, and therefore, there has been a decline in pressure. The fact that the pressure band from 300 to 350 pounds in southwestern Hutchinson County has moved slowly to the southwest indicates that the combined effect of drainage of gas out of that area and the production of gas out of wells in that area slightly exceeded the replenishment that that area had received by drainage into it from the southwest. (Vol. XCIX, pp. 15320, 15321, 15324.) The witness does not have the exact figures as to the production by Canadian from its leases in southwestern Hutchinson County, although he does know the approximate volume that has been produced. Witness did state, however, that the average per-acre withdrawals in that area had been less than the average per-acre withdrawals in the immediate adjacent sour gas area. (Vol. XCIX, p. 15321.)

Testimony of the Various Witnesses Relating to the Life of Canadian's Reserves.

Stanley Gill has testified at length on this question, which testimony has been heretofore abstracted. During the course of his testimony on the subject, generally, he stated the following:

> "It seems * * * very reasonable to assume that the economic life of Canadian River Gas Company's reserves will be determined by the economic life of the Texas Panhandle Field as a whole." (Vol. XCI, p. 14047, Exhibit 266, p. 13.)

Thompson testified that the life of Canadian's reserves as a practical matter is the same as the life of the Texas Panhandle Field as a whole. (Vol. XCIV, p. 14387.)

Hughes testified that the life of Canadian's gas reserves was about the same as the life of the field as a whole for the production of natural gas for long distance pipe lines. (Vol. XCV, pp. 14638-14639.)

Massa testified that the life of the field as a whole and the life of Canadian's reserves are the same. (Vol. LXXXIX, p. 13551.)

Peterson did not testify specifically on this point but did testify generally that:

> "The life of each lease must depend upon the life of the field." (Vol. LXXXII, p. 12229.)

Dickinson, witness for the Commission, testified generally that the life of Canadian's reserves was about twelve years from January 1, 1940, and that his company, which gets a portion of its gas from Canadian's acreage, considered that there would be no more pipe line property in service by the end of 1952. (Vol. LXIV, p. 9232.)

Additional Testimony With Respect To Canadian Acreage.

MAX K. WATSON, witness for Canadian, also testified on cross examination (Vol. 21, pp. 2968-2974; 2979-2980; 2990-3004; 3013-3018) as follows:

Q. Now, on Page 2, right below that listing of wells for each year you have this statement:

"With the exception of five so-called exploratory wells involved in lease obligations, the above drilling program contemplates that the wells to be drilled * * *" and so forth.

What five so-called exploratory wells do you have in mind?

A. This one well on the City of Amarillo section called the City of Amarillo test No. 1 and four wells to be drilled on the Bivins Consolidated lease, according to the contracts.

Q. Now, then, those five are included in this total of 41?

A. Yes, sir.

Q. Now, one has been drilled and that is the dry hole that you referred to, the City of Amarillo?

A. Yes, sir.

Q. Now, is any one of these remaining four so-called exploratory wells involved in your 1941 figure of five wells?

A. 1941 estimate?

Q. Yes.

A. Yes, there is one well included in 1941.

Q. Now, under what lease or leases are these five so-called exploratory wells set forth or where are the obligations to drill those wells set forth?

A. The four exploratory wells in the Bivins Consolidated lease.

Q. Four of them?

A. And one in the acreage acquired from the City of Amarillo.

Q. All right, one is already drilled. Now where in the Bivins Consolidated lease acreage are these exploratory wells to be drilled that you say are obligations under that lease?

A. We are to designate, as I recall it, the blocks of acreage. I'm afraid I can't answer that question. I am trying to say it from memory and we better refer to the lease.

Q. Those provisions are set forth in the lease, in the Bivins Consolidated lease?

A. Yes, sir.

Q. And do you have any independent knowledge of where that acreage is located with reference to the other acreage of Canadian River Gas Company?

A. In general?

Q. Yes, the acreage on which these exploratory wells are to be drilled.

A. They are south of that white line we called "Fault Line."

Q. In other words, south of the "Fault Line" on this exhibit 13-A, aren't they?

A. Generally south of there. Now, I don't know whether that is the same line to which I am thinking or not, but if that is our fault line they are south of it.

Q. All right, what does this fault line indicate on this map?

A. It indicates the probable limits of production with the information we have available today.

Q. Probable limits of production and that production has been north and east of the fault line, hasn't it?

A. Yes, sir.

Q. But this group of wells termed "Exploratory Wells" would be drilled south of that fault line?

A. I believe in every instance they would be drilled south of our fault line, as established by our own engineers.

Q. South of the boundary of the field?

A. That established by our own engineers.

Q. Yes. Well, is there any production in that area south of that fault line?

A. Yes, sir.

Q. Gas?

A. Yes, sir.

Q. In the Bivins lease?

A. Yes, sir.

Q. In this lease under which you are proposing to drill these exploratory wells?

A. Not in the consolidated lease, no.

Q. Not in the consolidated lease?

A. No, sir.

Q. And you are drilling these so-called exploratory wells specifically under drilling obligations, is that the reason you have them set forth?

A. As I remember it, they are specifically required.

Q. You wouldn't drill them down there if you didn't have a drilling obligation?

A. Well, possibly. When—

Q. You mean you would drill them in the area south of the fault line on this lease with the view of obtaining gas if you had no drilling obligation to do it?

A. Well, there may be gas down there.

Q. Has the company drilled any wells down there excepting these that they propose to drill under, as you say, a drilling operation?

A. The one City of Amarillo test.

Q. Is that in the Bivins field?

A. No, sir, it is in the area.

Q. I am talking about this great big block of acreage under this Bivins Consolidated lease that you would call the exploratory well area, whether the company has drilled any wells in that area itself before this.

A. Yes, sir.

Q. When?

A. 1928 or 1929.

Q. That is right. What did it find? How did the wells turn out?

A. Gas wells.

Q. Where are they located?

A. In the helium structure—the Cliffside structure.

Q. The Cliffside structure?

A. Yes, sir.

Q. I still say that it isn't within the acreage upon which you propose to drill the exploratory wells.

A. I don't know. We won't know until we drill.

Q. You don't mean to say the Cliffside structure is included in the Bivins Consolidated lease at present?

A. Maybe there are some sections in it. I don't know.

Q. Do you know exactly where these groups of acreages are upon which these exploratory wells are to be drilled?

A. It is fairly well scattered from Amarillo north clear into our present block of proven acreage.

Q. You yourself said the fault line is the line indicated on that map as representing the outline of the field, the proven field, didn't you?

A. I said as defined by present information.

Q. That is right. That is what we are going by. This is your company's map.

The so-called exploratory wells that you are proposing to drill and you have in this drilling program are being drilled to comply with the drilling obligations under the Bivins Consolidated lease?

A. They may also be to prove the information available today.

Q. Is that why you gave instructions to put in it this list, or did you put it in here to have them here involved in drilling obligation?

A. I put them in this list because the lease says specifically that they have to be here.

Q. Why do you make this statement—in other words, that is the only reason you put them in this lease, because the lease obligation requires you to drill them?

A. That isn't the reason I put them in here.

Q. That is the only reason you based the drilling on?

A. The only reason I based this drilling personally.

Q. You *way* that with the exception of five so-called exploratory wells involved in lease obligation, the above drilling program contemplates that the wells to be drilled will be completed as wells capable of producing gas in average quantities. In other words, in that statement you

are proposing to drill the other wells with a view of getting gas but you don't have such hopes with these exploratory wells?

A. It isn't very probable.

Q. It isn't very probable that you would get gas?

A. I don't know. You might say that that is a layman's opinion; not being a geologist, I don't know.

• • • • •

Q. And the Cliffside structure is not in this acreage upon which you are going to drill the exploratory well?

A. It is not in there, no.

Q. Where is it located with reference to this acreage upon which you are going to drill these exploratory wells, the Cliffside structure in relation to this acreage?

A. It is possibly—some of this acreage in the Consolidated Bivins lease may be in close proximity if not on the Cliffside structure.

Q. From your lease records you can certainly determine whether the Cliffside structure is separate or is a part of this acreage on which you are going to drill these exploratory wells, can't you?

A. I don't think the Cliffside structure is defined by the Government—that any of the acreage on the Cliffside structure is defined by the Government as included in this Bivins Consolidated lease because the Government had already purchased all the land which they thought at that time was in the Cliffside structure, but it is possible some of the acreage lies close to the Cliffside structure.

Q. Let me ask you this: Is there any producing gas well in this acreage in the Bivins lease that is set aside for these exploratory wells?

A. No, there is no gas produced from any of the acreage which is set aside for these exploratory wells.

• • • • •

Q. Now, then, this acreage on which these exploratory wells would be drilled, the first well in that group, is that reflected on this map?

A. The first well drilled when?

Q. To be drilled on that exploratory program.

A. It is somewhere on that exploratory lease.

Q. Where would that be located?

A. It isn't designated yet.

Q. Aren't those tracts set out as to each year, the num-

ber of acres in each tract, and then you determine where the well is to be drilled during that year?

A. I don't recall. As I understand it, the tracts are designated just before they are drilled, however, it may be those tracts have been designated and the map not definitely located on those tracts.

Q. I see. Now, that first well that was drilled on that exploratory program that you mentioned this morning—I want to come back to that. Where was that drilled, the well that resulted in a dry hole?

A. We have drilled two exploratory wells, you might say, since we acquired the Consolidated Bivins lease.

Q. The last one that resulted in a dry hole, what section was that drilled in?

A. In the Bivins exploratory lease?

Q. Yes.

A. The only one drilled was in Section 49, D & P Railroad, Block 018.

Q. That is colored yellow on the map?

A. Yes, sir.

Q. Now, then—

A. That well was drilled in 1939.

Q. 1939?

A. Yes.

Q. What did that well cost?

A. I don't have any figure on that.

Q. You don't have any figure on that?

A. No.

Q. Was the drilling of it contracted out or did your company drill it?

A. It was drilled the same as all the other wells have been drilled in the last several years.

Q. By the Phoenix Drilling Company?

A. Yes.

Q. And to what depth did they drill?

A. Possibly I have that information here. (Examining documents.) Yes, here it is.

Do you want the definite location on that?

Q. Yes.

A. Bivins A-26 was located 2,640 feet from the west line, 3,068 feet from the south line, Section 49, Block 018, D & P

Railroad Company survey, Potter County, Texas. The drilling was completed December 16, 1939. It was drilled to a total depth of 3,547 feet.

Q. No production at all was shown from that well?

A. No gas production, no, sir.

Q. Was there any oil production?

A. No, sir. It had a lot of salt water production, though.

Q. And you will get the cost of that well?

A. Yes, we can get that.

Q. All right. After that was drilled, isn't it a fact that the company, instead of drilling on a second block of that acreage, exercised its option and released the whole acreage, that whole block, rather than drill on the acreage?

A. I believe they did but I don't think I would know that definitely.

Q. You don't know whether on April 27, 1940 they exercised the option not to drill on the second block of that acreage and released it back to the lessor under the lease agreement?

A. I recall discussing that with Mr. Ford but I have never seen correspondence or a release on that.

Mr. Lange: We have a copy. It is not certified, but we would like to file it. We will have to make copies of it for counsel, it being subject to check for accuracy.

(The document referred to was passed to counsel.)

Mr. Keffer: We have no objection to the instrument being offered, if Mr. Lange desires to offer it, with the reservation, however, that we will have an opportunity to check it as to accuracy.

Mr. Lange: Oh, yes. It will be subject to check for accuracy.

The Trial Examiner: Now, Mr. Lange, I don't believe you stated exactly what the document was.

Mr. Lange: While the instrument doesn't bear any particular label, it purports to be a release of a certain block of acreage under the Bivins Consolidated lease, purportedly under provisions of that lease which are referred to in the instrument.

The Trial Examiner: What was the date of that instrument, Mr. Lange?

Mr. Lange: It is executed by Canadian River Gas Company, R. E. Wertz, Vice President, bearing the company's seal, and it is attested to by the Secretary, bearing date of April 27, 1940. We will have copies of it made in order to supply them to counsel.

The Trial Examiner: Very well. It will be marked for identification as Exhibit No. 96.

(Exhibit 96, Witness Watson, marked for identification.)

The Trial Examiner: I understand that you offer it in evidence, do you not?

Mr. Lange: Yes, sir.

The Trial Examiner: You have no objection to it being received in evidence subject to the provision you stated?

Mr. Keffer: That is right.

The Trial Examiner: Exhibit No. 96 will be received in evidence.

(Exhibit 96, Witness Watson, received in evidence.)

By Mr. Lange:

Q. Mr. Watson, do you know of the execution of that release of a block of this exploratory acreage on the Bivins lease?

A. No, sir, I have never seen it before.

Q. Will you read it and check it for accuracy in so far as you are informed as to the acreage involved?

A. I couldn't check it by just reading it, no.

Q. This is, as you have heard, a release of a certain acreage executed by Canadian River Company, It includes in that release designated acreage totaling 10,102.70 acres and gives that acreage by sections, and wherever it is only a portion of a section it so indicates.

Now, then, from that description could you point out on this map where the acreage is situated?

A. Yes, from that description I can pick it out on the map.

Q. Now, with reference to the Bivins lease indicated in yellow on this map, can you mark with an X mark those sections that are included in that release?

A. I expect I can find them.

Q. All right. Read each one when you check it so the reporter can get it down. If it is only a part of the section, so indicate.

A. This is designated as Drilling Block No. 1 in the so-called Bivins Consolidated lease. Section 17, the west-half and south quarter of Hartley County, 480 acres—this is going to take me some time.

Q. Well, I can read them off to you and you can locate them on the map. Will that speed it up?

A. I might as well have the data in my hands. To locate these sections as they are spread out on the map, I am going to have to check and double-check it. It is no simple job to check the sections.

Q. Where are they located generally?

A. This is a definite location or section which I will have to put a cross through.

Q. Very well, mark each one as you locate it.

The Trial Examiner: Are you putting a cross in there to signify the section?

Mr. Lange: He is putting an X mark in there to signify the section included in the release.

The Witness: I just mentioned this section which I will designate on the map now by an X mark.

Section 18, north 480 acres in Hartley County. The heading of this list of acreage should have been designated as Capital State Syndicate Survey, Block No. 21.

Q. All right.

A. It is designated on this map as B21-CSS.

Section 19, portion, all; located in Hartley County, 640 acres.

Section 29, portion, all; located in Hartley County, 365.7 acres.

Section 30, portion, all; located in Hartley County, 608 acres.

In the Capital State Syndicate Survey, Block No. 20, the following sections or portions of sections:

Section 26, portion, all; located in Hartley County and Oldham *Counties*, 597.6 acres.

Section 27, portion, all; Hartley and Oldham Counties, 640 acres.

Section 25, portion, all; in Oldham County, 234.4 acres.

Section 24, portion, all; located in Oldham County, 640 acres.

The next heading is Gunter & Munson, Block No. 2.

The Trial Examiner: How do you spell the first name?

The Witness: Gunter, G-u-n-t-e-r.

Did I read that for Section 24, portions all, in Oldham County, 473 acres? (No response.)

Section 23, portion, all; in Oldham County, 640 acres.

Section 67, portion, all; in Oldham County, 657 acres.

Section 27, portion, all; Oldham County, 322 acres.

Section 26, portion, all; in Oldham County, 325 acres.

Section 68, portion, all; Oldham County, 755 acres.

Section 64, portion, all; Oldham County, 640 acres.

Section 65, portion, all; Oldham County, 6440 acres.

The next group is East Line and Red River Railroad Survey, Block 9.

Section 1, portion, all; in Oldham County, 320 acres.

Section 2, portion, all; Oldham County, 320 acres.

That concludes this list, subject, of course, to correction.

Q. That is the total acreage indicated on this instrument, this release of approximately 10,102.70 acres?

A. Yes, sir, according to this instrument.

Q. Now, then, this block of acreage of 10,102.70 acres was released by the company in the exercise of its option under the Bivins lease not to drill that well, but, rather, to release this acreage and eliminate it from the lease?

A. According to that instrument, that is correct.

Q. So, under that the company would not have to—strike that.

In view of this release, the company did not have to drill that well and spend the amount of money that you had indicated as a minimum amounting to $30,000 per well that would have to be spent for the drilling of that well?

A. According to that instrument, that is correct.

Q. The only other well they drilled under these exploratory provisions resulted in a dry hole?

A. That is correct.

Q. Now, then, as I understand it, the company has the privilege under the Bivins Consolidated lease to release a similar block of acreage each year rather than drill and expend that amount of money in a minimum of at least $30,000? They could do that, couldn't they?

A. (Pause.)

Q. They could release the acreage rather than spend the money for the drilling of the well, couldn't they?

A. I believe that instrument states that.

Q. And if that is correct, the provision of the lease provided that that could be done with reference to these remaining four wells that you included in your drilling program, couldn't it?

A. Not according to that instrument. That covers only one 10,000-acre block.

Q. It covers only one 10,000-acre block?

A. Yes.

Q. But the company could proceed in like fashion for each of those four years if they desired?

A. I do not know whether that is right or not.

Q. You don't know?

A. No.

Q. You wouldn't say they could not do it?

A. No.

Q. It depends upon how long the lease reads?

A. That is right.

Q. You do know they did it in this one instance?

A. Yes, sir.

Q. And if they had the privilege to do it under the lease in this one instance and would exercise such an option each year, it would obviate the drilling of four wells out of their 1941 well program?

A. It would eliminate the exploratory wells.

Q. Yes, or a total minimum cost estimated by you as $120,000, being $30,000 per well?

A. That is correct.

Q. I notice this block of acreage that was included in this lease was all lying south of the fault line. Isn't that correct?

A. Yes, sir.

Q. You haven't had the opportunity to determine the accuracy of the map with reference to the several leases reflected thereon; however, all of this group of acreage which you said was designated in that release is in the portion shaded yellow, isn't it?

A. All that I have marked on the map as designated in that instrument, Exhibit No. 96, was.

Q. Yes.

A. It was in the territory colored yellow on the map.

Q. The legend on the map recites that the acreage colored yellow is the Bivins acreage embracing a total of 167,994.94 acres?

A. The legend on this map shows the same color as far as I can tell, designated yellow on the map; designation, number 30; lease named, Bivins; acreage, 167,994.94; per cent, 51.69.

Q. And this lease of some 10,000 acres comes out of that total acreage?

A. I don't know what it comes out of.

Q. The release cites it as out of Bivins acreage?

A. That is correct. It comes out of the Bivins consolidated acreage. As to whether it is that figure or not, I do not know.

Q. This figure in the legend is subject to correction as to accuracy and you are not substantiating that at this time.

Now, then, I notice this map carries the descriptive matter, as far as acreage and geographical locations are concerned, down to the City of Amarillo. This morning we were not able to spot-check the exact location of that dry hole drilled by your company in the vicinity of Amarillo. Can you do that now, Mr. Watson?

A. If I refer to my working papers to find the definite location of it, I can. (Examining document.) 167, 1980 feet

from the east line; 2640 feet from the south line of Section 167, Block 2, A. B. & M. Survey, Potter County, Texas.

The Trial Examiner: How did you designate it there? with a circle?

The Witness: With a circle.

By Mr. Lange:

Q. Now, that section isn't colored, is it, Mr. Watson?

A. No, sir. On this map it is not colored.

Q. It is not colored on this map. Now, it is joining a section that is colored yellow?

A. That's correct.

Q. That is Section 190?

A. Section 190.

Q. Then there is some other yellow sections, aren't there?

A. Yes.

Q. In that group. What are the others that are contiguous to the 190 that are colored yellow?

A. There is 480 acres out of Section 223; 480 acres out of Section 191.

Q. All of those that join the yellow group?

A. Section 192—full section 192; two-quarters of Section 221; two-quarters of Section 193. All of those are sections joining the section in which the City of Amarillo well was drilled, or joining each other.

Q. You haven't drilled on any of those sections, have you?

A. We have not.

Q. Any of those yellow sections that you just named.

A. We have drilled no wells on any of those yellow sections just named.

Q. And you stated this morning on request that you would get the copy of the lease on that section that you drilled the dry hole. You said you didn't have it but would get it.

A. A copy of the lease on Section 167?

Q. Yes.

A. Yes, sir.

Q. As well as the assignment of any part of the acreage.

A. We can get that.

Q. Now, do you have any information on which you can block this acreage in the Bivins lease on which these exploratory—on which the next exploratory well is to be drilled?

A. No.

Q. Well, could you block all of the acreage on which this group of four exploratory wells would be drilled regardless of their location?

A. Not from the information I have at present with me.

Q. Well, you have it available, don't you?

A. I expect it will be included in that Bivins Consolidated lease.

Q. From which you could block all of the acreage included in this area where the four exploratory wells would be drilled?

A. If those areas you designate are in that Consolidated lease, then I could tell in general where those wells would be drilled, but not the year in which each individual well would be drilled in each specific block.

Q. That's right, but you could mark an X on each of the blocks just as you did on the—as it has now been marked. Given those sections, why, you can mark all of those on the map?

A. All of those included in the exploratory lease.

Q. That's right.

* * * * *

Q. Now let's go to 1942. You have got six wells planned for that year?

A. Yes, sir.

Q. One of which is this exploratory well and in connection with that as with the exploratory well for 1941, if the provisions of the lease of the Bivins Consolidated are such that the company may exercise an option to release that block of acreage in lieu of incurring drilling obligations, why, that would eliminate one of those wells, wouldn't it, in 1942? If that is correct?

A. I don't know what that would be. This is my schedule.

Q. But I say, if the company has that option and exercises it like it did under this block under which they got a release, then there would be one well less in that program?

A. Then they would instruct me not to drill that exploratory well.

Q. Then that would leave five wells for 1942.

A. That is correct.

Q. Now, then, what is the first of those five wells? Where is it going to be and why is it going to be drilled?

A. Two wells will be drilled on a Bivins Consolidated lease for the same reasons for those drilled in prior years.

Q. Under this provision (b), to satisfy obligations under the lease?

A. As the period which we have estimated our development program to cover, as that period progresses the wells that we will drill will also begin to come under the requirements of our peak day, average peak month demands, that we will need that gas for other than such lease requirements.

Q. All right, let's see the first well that you are going to need. Is 1942 going to get into that part of the picture as to additional well requirements or additional amounts of gas to meet peak requirements?

A. It is going to be most difficult for me to say in what year any one well might be required for that purpose. I have looked at this program over the period from 1940 to 1947 and I have considered only average conditions, the probabilities, and although I have designated the well each year, it was for the purpose of only developing an early program, as being more economical and more practical from an operating point of view. Now, as to whether I drill a well in 1942 to supply my peak day will be most difficult to determine.

Q. All right, then, assuming that when you get to 1942 you are going to begin needing such a situation where peak days are going to require additional gas and therefore you have reached the conclusion that then you will have to drill another well.

A. No, I would believe that in 1942 we probably wouldn't need either of those wells for a peak day, but, however, a prudent operator would never drill right up to only his requirements. He would have a certain leeway, as explained this morning, for emergencies which the hazards of the business always force you to face one day or another.

Q. Well, how have you arrived at any even remote conclusion that by 1942 your peak days are going to require the gas that you could produce from an additional well?

A. Well, we'll refer to my Exhibit No. 94, Page 2, the middle of the paragraph, middle of the page:

"In arranging the program, the period covered has been considered as a whole and the total number of wells required has been to some extent apportioned over the years covered.

in order to avoid an abnormally large drilling program in any one year and to obtain the benefit of the knowledge gained from drilling a few wells for the purpose of most advantageously locating subsequent wells."

Q. Is that the basis on which you are proceeding in your drilling program for 1942?

A. Yes, sir.

Q. All right, now, aside from this lease obligation that you refer to, just tell us by what method you arrive at this conclusion that you are going to require this additional gas that will be produced from that well in order to take care of your peak days.

A. I figured my requirements in 1947, the number of wells I would require between the date of 1940 to 1947 and I distributed the drilling of those wells as uniformly as possible over the period covered from 1940 to 1947. Therefore, my requirements were estimated over the total period, as for any lease.

Q. All right, what are the mechanics that you went about in estimating those requirements?

A. We used the official Railway Commission tests as obtained in July and August of 1940 as to the potential of the wells on that date, on the date of which it was tested and the same curve would indicate the potential of any well at any other rock pressure. Now, that is as to the wells that are now drilled. I have the definite back pressure curve as obtained from the Railway Commission tests on the dates indicated.

Q. You have plotted that curve?

A. Yes, sir.

Q. Do you have a copy of it?

A. Yes, sir.

Q. Can we have it?

A. That curve?

Q. Yes.

A. They are in my work sheets and all bound together—quite a little book of it.

The Trial Examiner: We will stand in recess for five minutes.

(At this point a short recess was taken, after which proceedings were resumed as follows:)

The Trial Examiner: The hearing will be in order.

By Mr. Lange:

Q. What does this represent, Mr. Watson, this document?

A. They are sheets or curves plotted on log log paper in the back of this book which represents the test on each individual well as conducted jointly by the Railway Commission and the Canadian River Gas Company.

The Trial Examiner: The Railway Commission of Texas?

The Witness: The Railway Commission of Texas and the Canadian River Gas Company.

By Mr. Lange:

Q. How did you arrive at the construction of the average curve that you have on the first page?

A. The average curve—this book also contains a curve which I have designated as an average back pressure test, sweet and sour wells, from Railway Commission tests in 1940. That curve represents an average of all of the tests included as to each well in this same book.

Q. Now, how did you arrive at the rock pressure tests that you have for the year 1947?

A. I would like to read from my exhibit which is explicit. Page 3, the paragraph in the middle of the page:

"The future drilling program outlined above is based upon an average rock pressure decline of approximately 100 pounds during the period estimated, within the general area in which future wells of the company will be drilled. This is a judgment figure based upon my observation of the past performance of gas wells of the company as well as other gas wells in the field; also upon my knowledge of general conditions prevailing in the field."

MAX K. WATSON further testified on cross examination (Vol. 22, pp. 3055-3057; 3058; 3065-3070; 3081; 3100-3102) as follows:

Q. Now, referring to this Exhibit 94, Page 3, the center of the page, you make this statement:

"The future drilling program outlined above is based upon an average rock-pressure decline of approximately 100 pounds during the period estimated."

That is a period from what time to what time?

A. From 1940 to 1947.

Q. The period estimated?

Mr. Keffer: Are those years inclusive?

The Witness: Those years are inclusive.

By Mr. Lange:

Q. Then you continue on:

"• • • within the general area in which future wells of the company will be drilled. This is a judgment figure based upon my observation of the past performance of gas wells of the company as well as other gas wells in the field; also upon my knowledge of general conditions prevailing in the field."

Now, then, in arriving at this so-called judgment figure, what relation did you make to this so-called 100 per cent drop in pressure?

A. 100 per cent?

Q. 100 pound figure. I beg your pardon—drop in pressure.

A. I referred to the performance of the whole field, the trend within our own block of acreage and specific wells, the history of specific wells within our acreage, the history of specific wells throughout the Panhandle field.

Q. Well, did you consider the amount of past production of your company's wells, let's say during the past three years?

A. No, sir. That had no bearing at all on what I was studying.

Q. It had no bearing at all?

A. No, sir.

Q. The past production from your wells?

A. I was taking the trend of rock-pressure decline. As to its cause, I didn't investigate.

• • • • •

A. We possibly will not have rock pressures on all wells in any one month in any one year because they couldn't be shut in for sufficient time—

• • • • •

Q. You are still of the opinion that the judgment figure that you have used on Page 3 is better than just confining yourself to the company's actual past history?

A. Yes, sir.

Q. Why?

A. For this reason: We had not suffered appreciable drainage prior to about 1938. If you will look at your rock-pressure map of the Panhandle field, our acreage is the only one with the exception of a smaller part of the Cities Service in which there is practically—not practically, but close to virgin rock pressure, so it is obvious that somebody must supply the gas that has already been withdrawn from the field. Since the pressure is higher on our acreage than where it is being produced, we are going to suffer increased rate of migration.

Q. With reference to—

A. Therefore, the rock pressure would decline at a faster rate than increasing increment.

Q. Has there been any increases in rock pressures in any of your wells?

A. There has been an increase in indicated rock pressure but any individual rock pressure is subject to errors of the observer, for one thing, and another is that the well may have been pulled continually at a high rate and had not recovered its rock pressure. If you take any specific date on any specific well and pay no attention to the trends of before and after, there you will find it will be misleading. because a well cannot have an increase in rock pressure as rock pressure when there are withdrawals continuing in the field.

Q. How do you account for that showing of an increase when there is such a showing?

A. As I explained, the first might be that a person, a man observes that pressure and reads it as he sees it. Of course, he is reading a pressure gauge or dead-weight gauge and he might misread it and not knowing he has misread it report it to the office. We record that pressure because it has an observation. He may have read it right.

The next observation, if it shows an increase, shows that pressure was not rock pressure but some other pressure and it may have been a partial rock pressure or an error in observation. Therefore, a specific rock pressure taken by it self may be a normal increase or an abnormal decrease, but

the trend is if enough pressures are taken you have eliminated the possibility of the things I have just mentioned.

Q. Just as you mentioned, too, there may be that same character of error reflected in a reading that shows a decrease of pressure?

A. Yes. It is the same way unless the decrease continues for subsequent and prior rock-pressure recordings. If it is a consistent decline, you can check that pressure as being correct because you don't make the same error each time you read it.

Q. In your experience, how frequently or how common are such errors in the reading of the pressures?

A. I don't believe a man would make the same error twice for the reason that if we see an abnormal pressure, either high or low, we call it to the tester's attention. When he goes back to the well he is as much interested as we are in getting the right answer. He would be careful in taking the pressures as of that date and the well would be left shut in if it did not increase in pressure any more, if it was possible to do so, and the next pressure would be; more than likely the correct pressure, although still the error might be there as to the length of time shut in.

Here is what I am trying to point out: If I go to a well on January 1, 1940 and I get 390 pounds; then I go there in March and get 400 pounds, and I go there in June and I get 400 pounds; I go there in July and I get 398 pounds, and I go there later in the year and get 397 pounds—I never did observe a pressure less than 390 pounds—I naturally could eliminate 390 pounds because the trend was from 400 pounds down, indicating that the 390 pounds should have been 400 or 401 pounds, and the other pressures, because they showed the trend carried on throughout the subsequent observation period was declining, which it should do. There can be no reason for a well increasing in pressure unless the production around that well or in that area has decreased or you might say ceased. That has been the case in the Borger area, but they were withdrawing a normal amount of gas and it was migrating in. When the distributing law was passed the field was shut in and the heavy withdrawals were discontinued. Then the pressures began to build up. We have one well which I am satisfied the pressure has built

up two or three pounds over a period of a year. It was over in that heavy withdrawal area.

Q. Which well is that?

A. Bivins B-5.

Q. Bivins B-5?

A. Yes.

Q. And how did that behave?

A. It builds up, as I recall it, two or three pounds after the shut-down order was made and stripping was stopped it built up a few pounds because it was close to heavy withdrawals. Naturally, the withdrawals were holding that pressure down and as soon as it shut down the pressure built up. It built up possibly for a year or two and the natural decline took effect again as it started down and has continued down.

Q. Do you have any other well that behaves in a similar fashion?

A. That builds up?

Q. Yes.

A. A continuous buildup over a period of time that I would be willing to accept as a buildup?

Q. Yes.

A. I don't believe there was. Possibly our Bivins B-2, the closest to the Bivins B-5, may have built up or the rate of decline may have decreased but I am not certain of that. It is an area in there that was suffering excessive drainage.

Q. How do you know that it was suffering excessive drainage?

A. From the rapid decline of rock pressure.

Q. You relate that directly to the rapid decline of rock pressure as indicated in those wells?

A. I don't necessarily, but it certainly indicates the rapid decline and certainly indicates rapid withdrawals and we weren't withdrawing it at any rapid rate so it must have been migrating out of that area.

Q. Well, why has there been no drilling on those leases and the company continues to hold them anyway?

A. Because drilling wasn't required.

Q. And those leases, then, don't get any protection under the company's equitable prorations program?

A. I presume they are protected by some other means other than including them in the proration picture.

Q. Now, then, in any of these proposed wells you have set forth on this list on Page 2, eliminating those so-called exploratory wells, would any of those wells in the remaining list be drilled in the sweet gas area, all of them in the sweet gas area?

A. All of them would be drilled in the sweet gas area.

Q. They would?

A. Yes.

Q. Now, then, on Page 8 of Exhibit No. 94 you have this provision: "Sour Gas Treating Plant"—before I get to that I wish to ask you this: Does the company have no producing wells at present that have sufficient—strike that "sufficient"—that have a volume of gas—no, that have a quantity of sour gas sufficient to keep them off the line?

A. We can produce from those sour gas wells a small quantity of gas which will not contaminate the total amount of gas pressure so it will not be usable for pipe line use, so if all of the wells with the exception of one are producing small quantities of gas—

Q. Into the line at present?

A. Very small quantities to the line at present.

Q. Can you spot those wells on the map?

A. Yes, sir.

Q. Will you do so?

A. Bivins A-9, located in Section 6, C & S S, Block 21; Bivins A-10, Section 18, G & M, Block 2; A-8, Section 4, E L & R R R, Block 25; Bivins A-22, Section 13, G & M, Block 2, which is not connected. Those locations, especially the block numbers, are subject to correction.

Q. Yes. That is the total of how many wells that produce sour gas?

A. Four wells.

Q. What is the percentage? Have they been tested with reference to the quantity of sour gas?

A. Yes.

Q. What do they show?

A. Varying quantities. Beginning with the well closest to the sour line it is a little less than two grains as determined by the Texas Railroad Commission, and getting progressively more sour west to, as I recall it, it is approximately 9 grains or 12 grains, on Bivins A-9 as tested by the Canadian River Gas Company. The Railroad Commission was only interested in locating the sour gas line and they

assumed that all wells west of that line were sour and did not test them, and such is the case.

Q. What are the open flows of those wells, the last that you have record of?

MAX K. WATSON further testified on cross examination (Vol. 30, pp. 4156-4159) as follows:

Q. Now, Mr. Watson, the company proceeded with the drilling and actually completed the drilling of that Amarillo No. 1, didn't they?

A. Yes, sir.

Q. And what was the approximate total cost of that well?

A. Approximately $49,000.

Q. Approximately $49,000?

A. Yes.

Q. And just so that it ties right in at that point—it may be in the record heretofore—what was the approximate time that that well was completed? What month and year?

A. Early in 1940.

Q. Early in 1940. Do you recall the month?

A. No. I can find that in the record here somewhere. The City of Amarillo No. 1, completed June 17, 1940.

Q. Completed June 17, 1940?

A. Yes, sir.

Q. Now, then, if that well had been brought in as a producing gas well—strike that.

Are there any producing gas wells right in that locality on any of that acreage in that locality?

A. The Helium structure produces about ten miles northwest of that location.

Q. Not any gas producing well is in existence on any of the yellow Bivins blocks on this map, Exhibit No. 95, is there?

A. No, sir.

Q. And you stated that the company had not heretofore drilled any of those blocks on the Bivins acreage?

A. Oh, yes.

Q. Contiguous to the acreage on which this Amarillo No. 1 was drilled?

A. That block to which you are referring on that Bivins consolidated lease—

Q. Yes.

A. —is not all contiguous to that City of Amarillo test. That block is spread out all over Potter County.

Q. But the block itself, all of which is contiguous to one block of Bivins acreage—

A. Some of the acreage is contiguous to the City of Amarillo test but not all of it.

Q. That's right, but not on any one of those sections in that yellow acreage designated on the map, Exhibit No. 95, contiguous to or adjoining the acreage on which Amarillo No. 1 was drilled has heretofore been drilled by Canadian River Gas Company?

A. No. There are only two thousand acres of that block contiguous. The other eight thousand acres is somewhere else.

Q. I see, but I want to get definitely fixed that there is no well drilled by Canadian River Gas Company as a test on any of this Bivins acreage contiguous to Amarillo—

The Trial Examiner: What is that section number, Mr. Lange?

Mr. Lange: Section 190.

Q. Now, then, if this well Amarillo No. 1 had been brought in as a producing gas well, where would delivery of that gas have been made?

A. Probably would have been made on the Amarillo Oil Company lines supplying Amarillo with gas, if there had been a gas well.

Q. If it had been an oil well, according to this Exhibit 123, the Amarillo Oil Company having retained the oil rights, what would have happened to the well?

A. I don't know. I suppose the Amarillo Oil Company would have had an oil well.

Q. You don't know under what arrangements that would have been handled?

A. No, sir.

Mr. Keffer: Right in that connection, Mr. Lange, I believe the agreement shows precisely how it would have been handled.

Mr. Lange: I was asking whether this witness knew of his own knowledge.

We will prepare the necessary copies of the three exhibits 122, 123 and 124, Mr. Examiner, and make them available.

Exhibit 123 introduced by Commission constitutes the agreement between Amarillo Oil Company and Canadian River Gas Company with respect to the well drilled by Canadian River Gas Company on land owned by the City of Amarillo, and which was drilled near the city limits of Amarillo. Said Exhibit provides that Amarillo Oil Company should assign to Canadian the gas rights on oil and gas leases aggregating in excess of 4,000 acres, including three tracts that Amarillo Oil Company had contracted for but had not at that time acquired title.

The contract among other things provides:

"Amarillo Oil Company will assign the leases listed above and such leases as it acquires under the contracts mentioned above, to Canadian River Gas Company on the following terms and conditions:

"A. Amarillo Oil Company will assume the entire cost of acquiring such leases and contracts for leases;

"B. Amarillo Oil Company will retain the oil and oil rights;

"C. Canadian River Gas Company will assume the obligation as to the drilling of the test well as provided for in the proposed lease from City of Amarillo to Amarillo Oil Company, covered by the agreement with the City of Amarillo above described;

"D. Amarillo Oil Company and Canadian River Gas Company shall enter into an Operating Agreement for the purpose of defining their respective rights and obligations with respect to such leases as are assigned, the terms and provisions of such Operating Agreement to conform with those contained in that certain Operating Agreement dated January 3, 1928, entered into originally between Canadian River Gas Company and Amarillo Oil Company, subject to such changes and modifications thereof as may be deemed necessary or advisable by counsel or agreed upon by the parties; provided, however, that in the event of conflict between the terms and provisions of said Operating Agreement last above referred to and the terms and provisions of the leases to be assigned, it is understood and agreed that the terms and provisions of said leases shall control."

The gas rights on the entire acreage were to be assigned to Canadian free of cost to Canadian but with the obligation upon Canadian to drill a test well on such acreage.

If the well drilled had been an oil well Amarillo Oil Company would have been obligated also to have paid for the well. Exhibit 16.

J. D. THOMPSON, JR., testified that he had recommended that this well be drilled. His testimony is as follows:

"Q. (March) Did you recommend the dry hole drilled down here by the city limits of Amarillo?

"A. Yes.

"Q. I notice Canadian River has some acreage there. Did you think possibly that there was gas there?

"A. Yes.

"Q. You wouldn't recommend the drilling of a dry hole if you knew there wasn't any gas there, or had good reason to believe there wasn't any gas there, would you?

"A. No. * * *" (T. 11168-11169).

Mr. Thompson further testified as follows:

"Q. Do you know whether or not, Mr. Thompson, that well showed both oil and gas?

"A. Yes, they had a show of oil and a show of gas, and it showed a favorable structural situation, just about as had been anticipated from our work, * * *" (T. 11169).

The Bivins consolidated lease at the time of the hearing contained approximately 40,000 acres in exploratory drilling blocks of approximately 10,000 acres each which had not been drilled or released. This acreage is designated as undeveloped acreage. The lease provides that the obligation to drill upon any one of these 10,000 acre tracts may be eliminated by surrendering the acreage. The lease also provides that such acreage may be held in force and effect in the absence of drilling by the payment of an annual delay rental of $1 per acre as to each 10,000 acre block upon which a well is due but has not been drilled. (Exhibit 129.)

J. D. THOMPSON, JR. further testified with respect to the exploratory drilling blocks contained in the Bivins consolidated lease as follows:

"Q. (March) • • • Do you consider all that acreage worthless?

"Mr. Keffer: To which acreage are you referring?

"Mr. March: The acreage of the Canadian River Gas Company below the southern boundary of the field (below the fault line).

"The Witness (Thompson): No.

"Q. (March) What do you mean by saying it is not worthless if it is outside the boundary of the field?

"A. In my opinion it has oil and gas possibilities, although it is not proven." (T. 11162.)

Thompson then elaborated still further upon the production possibilities of this acreage. He called attention to the fact that the Helium Dome in Potter County from which the United States Government produces large volumes of gas is also located south of the Potter County fault line and is not within the boundaries of the Texas Panhandle Field. He said that the Helium Dome constituted a local structural high which had trapped a large volume of gas. He also called attention to the fact that there was a well located in Section 37, Block 5 G&M Survey, Potter County, which originally had a good flow of gas. It will be noted from an examination of Commission's Map 95 that this well is located only about one and one-half miles from Canadian acreage south of the fault line (T. 11163-11164).

Thompson also made the following statement:

"Now, it has been quite a problem to me to try to evaluate the oil and gas possibilities of the Canadian River acreage below that fault line. I have spent a lot of time considering it and there have been surface geological surveys made in areas where we have outcrops that permit that and certain areas have shown favorable conditions from the standpoint of surface geology.

"I have also taken into consideration the favorable indications from the standpoint of sub-surface geology such as this anticlinal structure that I have already described, and then there has also been made a magnetometer survey which indicates certain favorable areas and that has been further checked by torsion bal-

ance survey which indicates favorable areas and in several instances these favorabl indications by these various methods coincide in a given area and that makes me very reluctant to dispose of that acreage until we have had test wells drilled, and even though the results of one test well on one area might turn out to be a dry hole, it might develop information which would cause me to make—or to recommend a location in that immediate area not far from the dry hole." (T. 11164-11165.)

Thompson further stated that he could not give the Canadian acreage south of the fault line any reserve figure at this time because it was unproven acreage (T. 11168). Thompson stated that the acreage does have production possibilities.

On further redirect and recross examination with respect to Canadian acreage south of the fault line (Vol. 76, pp. 11168-11170) the witness stated:

Q. Well, Mr. Thompson, now, if your estimate of reserves is a correct figure, why is it that you leave out all of this area that you think will be productive of gas?

A. I didn't say I thought it would be productive. I said that I thought it should be explored before we released it.

Q. Hasn't a great part of it been explored?

A. No.

Q. You would consider it too valuable to release?

A. Yes.

Q. Did you recommend the dry hole drilled down here by the city limits of Amarillo?

A. Yes.

Q. I notice Canadian River has some acreage there. Did you think possibly that there was gas there?

A. Yes.

Q. You wouldn't recommend the drilling of a dry hole if you knew there wasn't any gas there, or had good reason to believe there wasn't any gas there, would you?

A. No. You drill a great many dry holes in exploratory work. That's how oil and gas fields are found is just to hop out in the middle of an undrilled area and see what you get, and the use of geology and geophysics merely reduces the hazards a little bit.

Q. Now, so much for that end of the field south of the Potter County fault line.

Mr. Keffer: I wonder if I could ask a question on the Amarillo well?

Mr. March: Why, certainly. Go ahead.

Mr. Keffer: Do you know whether or not, Mr. Thompson, that well showed both oil and gas?

The Witness: Yes, they had a show of oil and a show of gas, and it showed a favorable structural situation, just about as had been anticipated from our work, but where these shows occurred the porosity was so limited—I don't suppose there was more than six inches of formation that showed any porosity at all and that was very low porosity.

By Mr. March:

Q. What was the per cent porosity of that well?

A. I don't know, but I looked at the samples and I could see that it was very tight and just one sample in each instance, as I remembered it, showed some pore spaces in the rock, and I considered that had the porosity and permeability been present we would have had a commercial well. The structural situation was favorable.

Q. That well wasn't drilled on Canadian River acreage, was it?

A. I believe it was.

Q. Mr. Thompson, before we go to the north, I want to ask you this question about the helium dome: Do you think there is any possibility of any drainage between the Panhandle field proper and the helium dome?

A. No.

Q. Why is that?

A. Because there is no interconnection.

Q. How do you know there is no interconnection?

A. The helium dome has a much higher rock pressure than the main Panhandle gas field.

Wallace testified (Vol. 52, pp. 7266-7276) as follows:

Q. Now, what other acreage in the Bivins lease have you classified at $1 per acre?

A. 64,748.34 acres. Generally that acreage that I have classified in "C" classification is below the fault line; that

is, the recognized southwestern boundary of the field and the acreage from the field south to the city of Amarillo, Texas.

Q. And the fault line is the staggered line indicated on Exhibit No. 95?

A. I believe that fault line is as it is staircased by the Canadian River Gas Company but I have used the fault line as nearly as possible that has been adopted by the Texas Railway Commission. A fault line usually runs straight. It doesn't run stairsteps.

Q. All of this acreage is below both of those lines, isn't it?

A. Yes, with the exception of possibly a portion of some of the leases that may extend over the fault line.

Q. Now, this acreage in that Section 190, right immediately north of Amarillo, that is, you say, in your opinion, one that has a value of $1 an acre?

A. At this time I don't think it has a value of more than a dollar an acre.

Q. You would say it even has a value of $1 an acre for gas production purposes?

A. A dollar an acre does not entirely represent the value for gas. I have given it $1 an acre—$1 an acre for this acreage, because it is part of one lease; it is all validated, and there is a great deal of it that is "Wild-Cat," of which you know, and I have considered a dollar an acre was a fair value as a carrying charge, not as a value of gas.

Q. What in your opinion do you define as "Wild-Cat" acreage?

A. Acreage that is not accepted as proven acreage.

Q. As a matter of fact, there is no gas well that has ever been brought in on any of that acreage?

A. No, but there are some dry holes on some of it.

Q. The dry holes have a very definite indication there is no gas in that particular area?

A. No, just in the well.

Q. But every well that has been drilled in that area has been a dry hole?

A. That is right.

Mr. Keffer: Just a minute, Mr. Lange. What do you mean "in that area"?

Mr. Lange: This acreage he has under "C" below the fault line.

Mr. Keffer: You mean in the area on that acreage or in the general area?

Mr. Lange: On that acreage.

Mr. Keffer: There are two different things there. There are gas wells in that area but none of it is on this particular acreage.

By Mr. Lange:

Q. There is no producing gas well that has ever been drilled on what you classified under "C" in the Bivins lease?

A. No.

Q. Do you know the provisions of the Bivins Consolidated lease and what has to be done by the lessee in connection with that lease?

A. Yes, they are to drill or cancel.

Q. To drill or cancel?

A. Yes.

Q. There is no definite obligation for them to drill if they desire to exercise an option to cancel?

A. No.

Q. In any year they so desire they can cancel that particular drilling block or that block of acreage by so notifying the lessor?

A. That is correct.

Q. Without drilling and without any obligation?

A. That is right.

Q. And without any way affecting the remainder of the leasehold?

A. That is right.

Q. Then you still believe that in the light of the history of that particular acreage that you classified as "C" under Bivins, what has happened to it is it is still worth $1 an acre?

A. Yes, I do, because it covers such a large acreage and there are so many unknown quantities. It may be possible a pool may be discovered where that acreage is located.

Mr. Keffer: Could I interpose a question there, Mr. Lange?

Mr. Lange: Yes.

Mr. Keffer: Would you come to the map which is marked

as Exhibit No. 95 and look in Section 37 in G-M Block 5 Potter County, and tell me what you find there on the Commission's map?

The Witness: A gas well is marked there.

Mr. Keffer: What is the size of that gas well?

The Witness: It came in originally purported to be 7,000,000 cubic feet. I don't know what it is at this time.

Mr. Keffer: What is marked on the map?

The Witness: 7,000,000.

Mr. Keffer: 7,000,000?

The Witness: Yes.

Mr. Keffer: Is that well south of the fault line?

The Witness: It is south of the fault line and it is a very deep well.

Mr. Keffer: How far is it from a substantial portion of this "C" acreage that is contained in the Bivins Consolidated lease?

The Witness: Approximately a mile and a half or a mile and three-quarters.

By Mr. Lange:

Q. Whose well is that? Who owns that well?

A. It is purportedly owned by the Humble. I do not know the ownership of it just now. It may still belong to Humble.

Q. Going back to this 190 acres immediately north of the city of Amarillo, do you know anything about the well that was drilled by Canadian River on an acreage adjoining that?

A. Yes, I observed the drilling of that well from practically top to bottom.

Q. You did?

A. Yes.

Q. That was a dry hole?

A. Yes, sir.

Q. And what other drilling operations took place on that particular acreage?

A. On that particular lease?

Q. Yes.

A. There was an old well drilled about 2,000 feet deep, as reported on that map, that seems to correspond with the place on the map where I have indicated there. I think it was drilled by the City of Amarillo. It was a dry hole. It was only drilled 2,000 feet deep.

Q. When was it drilled?

A. I don't have the history of it.

Q. Was it drilled prior to the other well?

A. It was drilled prior to the well of the Canadian River.

Q. How far is that acreage from the nearest producing gas well?

A. This map—if this map was marked up to date—I don't believe it is—indicates it is about seven or eight miles from the helium gas field that is controlled by the United States Government.

Q. Is there any producing gas well closer than that?

A. Not unless that map is not accurate. I don't believe we have marked our map accurately, at least, I have not on the helium pool. I would have to check it. There are more wells in on the helium pool than I see on that map, but I don't know the location. I will say they are not close to that acreage as they are several miles removed.

Q. Now, the Bivins Consolidated lease aside from this acreage that is below the fault line, *covera* acreage above the fault line that is in the producing area, doesn't it?

A. Yes.

Q. And as you stated, this group of acreages that are covered by the Bivins lease below the fault line are subject to the company releasing them if they don't drill or pay delay rentals?

A. Yes.

Q. And you have given that acreage a value of $1 an acre?

A. Yes.

The Trial Examiner: You said something about there being a carrying charge, Mr. Wallace. What do you mean by that?

The Witness: That is a term we use in our industry. We quite often have leases that we don't consider of very much value but yet there is a remote possibility, particularly if they are scattered over large areas where there are

deeper sands or something that they might come in; but yet at the present time, there is nothing to indicate any lease value; for the fact that they are part of one large lease or within or are checker-boarded, we usually call it a carrying charge or a carrying value of a dollar an acre. It doesn't represent the commodity. The oil and gas rights might be worth more, but it might cost more than that to secure a lease from a landowner so we call that a carrying charge in oil field terms.

By Mr. Lange:

Q. When you speak of a carrying charge, that is not to be in any way related to what you term market value?

A. Yes, it goes into the market value with a lease of 313,588.38 acres and having 64,000 of it that is not determined as proven acreage and not in the generally accepted proven acreage. I believe that all Class C acreage probably would sell. The 64,000 acres covers such an enormous area as it does there might be a possibility of some pools coming in.

Q. Let's take the Class C acreage standing alone, what about that?

A. That 64,000 acres amounting to $64,000, I believe there is enough evidence—the well we spoke of I presume is the Humble which will give you some encouragement—

Mr. Keffer: Just a correction there. The Humble at one time owned that but it has been sold to the Government. It serves as part of their helium reserve.

The Witness: I don't know what disposition was made of it. Another factor is that some of the dry holes that have been drilled in there have had some small showing of gas.

By Mr. Lange:

Q. You still value them at $1 an acre?

A. Yes.

Q. Do you think it is good operating management for Canadian River Gas Company to just release a whole block of 60,000 acres like that because they don't want to drill on it?

A. Yes, I think with the enormous proven acreage they have I would release it.

Q. You would just let that go and charge it off?
A. I would.

Mr. Keffer: I didn't get your answer.

The Witness: I said, yes, with a proven—with a large proven acreage I think I would personally consider the lease practically of the same value and accept $64,000 as it is.

By Mr. Lange:

Q. And if they release subsequent blocks, as they have the right to do, that would be good operating management?
A. I don't see that it would affect the producing lease in the least. I think the earnings that property would show—producing property and proven property wouldn't be affected in the least by the surrender of the "C" acreage.
Q. That would wipe out your Class C valuation there?
A. Yes, sir, that is right. If they didn't own it, I wouldn't classify it, but owning it I considered a dollar an acre sufficient.

* * * * *

Wallace further testified (Vol. 52, pp. 7277-7278) as follows:

Q. Now, as I understand from your statement, referring to all of the remainder of the Class C acreage under the Bivins lease, do you know—first of all, on which of those sections there have been any drilling operations heretofore?
A. On Class C acreage?
Q. Yes, C leases.
A. I am afraid I will have to get my own map. I may be able to find it from this one. There is in Section 2, A, B & M 20, there has been a dry hole drilled or indicated as a dry hole on this map. The records show that that well did have some gas but apparently too small to class as a commercial well.
Q. I see.
A. You asked just for the Bivins C acreage?
Q. Yes.
A. In Section 49 of Beatty and Moulten Survey, Block 2, there was a dry hole drilled which is on the Class C acreage. that is all.

Mr. Keffer: How far apart are those two dry holes?

The Witness: Those two dry holes are—

Mr. Keffer: Just approximately. Guess at it, is all. 20 miles?

The Witness: I would say approximately 30 or 35 miles apart.

60. Amortization, Depreciation and Depletion—Canadian.

Accumulated Depreciation and Depletion and Its Application to the Original Cost of the Producing and Gathering Properties of Canadian as of December 31, 1938.

For the respondent there was introduced and received in evidence (Vol. XCVIII, p. 15279) Exhibit No. 272, entitled as above, and prepared by Witness H. E. Roberts.

The identity and qualifications of Witness Roberts (Vol. LXXXXIV, pp. 14413, et seq.) are as follows:

Full name: H. Emmett Roberts, 39 Broadway, New York City; age 44; graduate of East Orange, N. J., High School and Sibley College, Cornell University, with M.E. Degree in 1918. Upon graduation entered employ of Westinghouse Lamp Company, Bloomfield, New Jersey, and from there went with Thomas A. Edison Company, West Orange, N. J. In the summer of 1919 entered employ of FB&D, Inc., where he has remained since. His work with FB&D has been in the capacity of an engineering specialist in the valuation of industrial and public utility properties, including the valuation of pipe lines for public utilities, oil refineries and industrial plants, distribution properties of gas, water and electric companies, oil and gas wells, electrical and miscellaneous equipment of public utilities and industrial plants, and retrospective appraisals.

Some of the principal companies on the valuation of which he has worked are: Atlantic Refining Company; Livingston Oil Corporation; Standard Oil of California; Peoples Natural Gas Company; Keen & Woolf Oil Company; Oklahoma Natural Gas Company; Okmulgee Gas Company; Kansas City Gas Company; Richfield Oil Company of California; Hope Natural Gas Company; Arkansas Natural Gas Company; New York Steam Company; Ponca City Gas Company; Amarillo Gas Company; West Plains Gas Company; Sinclair Consolidated Oil Company; Ohio Fuel Gas Company; Panhandle Pipe Line Company; the East Ohio Gas Company; Philadelphia Suburban Water Company; United Fuel Gas Company; Natural Gas Company of West Virginia; Indianapolis Gas Company; Indiana Gas Utilities; Pennsylvania State Water Corporation; Colorado Interstate, and Canadian.

In connection with the valuation of pipe lines he made field studies of the performances attained in the construction of pipe lines. One of these studies covered the whole construction period of a 60-mile long pipe line (4 in.) for the Carbide and Carbon Chemicals Corp. from Leach, Kentucky, to South Charleston, West Virginia.

Mr. Roberts has worked with Mr. Rhodes in connection with the reproduction cost appraisals of the pipe line properties of Canadian and Colorado Interstate. He has spent a good part of his time during the last year or so in connection with the work which FB&D has been doing in the present rate case, beginning in March, 1939. As assistant to Mr. Rhodes he was Field Engineer in Charge and worked on depreciation, that is, condition of the property, as well as on reproduction estimates. (Vol. LXXXXIV, pp. 14415, et seq.)

Exhibit 272 consists of three statements numbered 1, 2 and 3.

Statement No. 1 is captioned: "Canadian River Gas Company Accumulated Depreciation and Depletion of the Original Cost of Production and Gathering System Property as of December 31, 1938."

Statement No. 2 is captioned: "Canadian River Gas Company Segregation of the Original Cost of the Production and Gathering Properties to Direct Costs and General Construction Costs, as of December 31, 1938."

Statement No. 3 is captioned: "Canadian River Gas Company Accumulated Depreciation of Original Cost of General Properties and its Allocation by Property Systems, as of December 31, 1938."

Statement No. 1 is as follows:

Statement No. 1
Canadian River Gas Company
Accumulated Depreciation and Depletion of the Original Cost of Production and Gathering System Property as of December 31, 1938

Notes: (A) As shown on Exhibit No. 183, adjusted as shown on Statement No. 2 attached.
(B) As shown on Statement No. 3 attached.

This Exhibit 272 is prefaced by an explanatory statement of H. E. Roberts. (Vol. LXXXXIV, pp. 14418, et seq.) We quote somewhat at length from this explanatory statement:

"Scope of This Exhibit

This exhibit shows the depreciation and depletion accumulated at December 31, 1938, in the production and gathering facilities of Canadian River Gas Company, which are described in Exhibit No. 89 by Max K. Watson, and its application to the original cost of these facilities, presented by W. A. Lusk in Exhibit No. 183.

"The depreciation accumulated in the property was determined by studies of the extent to which the physical phenomena that ultimately lead to the retirement of items of property had progressed. Depreciation as determined is separate and distinct from accruals for amortization against the possible termination of or major changes in the Canadian River business.

"Depletion computed herein refers to the using up of the gas supply and is based on the gas withdrawn from the Panhandle gas field from May 31, 1928, to December 31, 1938, in relation to the estimated recoverable gas reserves at the first date.

"Leaseholds

"Accumulated depletion in leaseholds has been computed each year from 1928 to 1938, inclusive, in direct ratio to the relation of gas withdrawn from the Panhandle field each year to the gas reserves remaining at the beginning of each year. This computation is based on the depletion of the field as a whole as testified by other witnesses.

"The original gas reserves estimated as recoverable at 50-lb. gauge by J. D. Thompson in his Exhibit No. 207 less the gas withdrawn through 1927, as shown by C. J. Peterson in Exhibit No. 206, gives the remaining gas reserves as of January 1, 1928. The annual withdrawals in that year, as shown by Mr. Peterson in Exhibit No. 206, divided by the reserves as of January 1, 1928, then gives a ratio which indicates the percentage depletion of the gas reserves in the field in 1928. The

successive reduction of the remaining reserves at January 1 by the annual withdrawals each year, as reported by C. J. Peterson in Exhibit No. 206, gives the reserves remaining at January 1 of each of the following years. Successive division of the reserves at January 1 each year into the gas withdrawn in that year, gives the percentages of depletion for each year since 1928.

"The depletion ratios determined as above, applied to the Company's remaining investment at January 1 each year, gives the depletion sustained by the Company in that year except that in the first year of the Denver line operations the Company's investment at June 1 in its presently held acreage (as of December 31, 1938) was depleted at seven-twelfths of the rate of depletion in the field as a whole. Deduction of this Company depletion during 1928 from its June 1 investment, plus the investment added during the year, gives the Company's remaining investment in leaseholds at January 1, 1929. Thereafter the successive deduction of depletion sustained and the addition of new investment added December 31, 1938, of $3,248,580 which is 64 per cent of the original cost of the leaseholds held at that date. Therefore, the accumulated depletion in the Company's leaseholds at that time is taken at 36 per cent.

"Land and Rights of Way

"No depreciation on land and rights of way has been allowed in this exhibit.

"Gas Well Construction (Account 211)

"Gas well construction which comprises the intangible well drilling costs is depleted by the same method as leaseholds. This determination resulted in 31 per cent depletion as of December 31, 1938.

"Gas Well Equipment (Account 212)

"Owing to the difficulties of physical examination of gas well equipment, this equipment has not been depreciated but has been depleted in accordance with the depletion accumulated in the gas well construction account.

"Buildings and Structures

"The depreciation existing in buildings was determined by a detailed inspection of the buildings and structures in the field. Field inspections were tabulated and summarized and the condition of the buildings determined in groups such as those at a compressor station. In determining such depreciation existing in these buildings there was taken into account the depreciation found to exist in the various parts, the relative extent to which parts contributed to the whole cost of the structure and the relative extent to which the individual structures contributed to the total cost of the whole group.

"Field Line Construction and Equipment

"The depreciation suffered by the Company's production system pipe lines was determined from inspections made in the summer of 1939. Inspection points, numbering 125, were chosen on those lines spaced at intervals representing roughly $10,000 in cost. On the 22-inch main gathering line this spacing was three-eighths of a mile and on the 6-inch line about one and seven-eighths miles. On each size of line the locations of the points of inspection were at substantially uniform intervals. The locations were chosen in the office from maps and were marked out in the field from the nearest available landmarks.

"At each location a hole was dug uncovering the pipe for a length of about 4 feet of width and depth sufficient to permit inspection of the pipe on the bottom as well as on the sides and the top. In each test hole the pipe was thoroughly cleaned for a length of about 3 feet and in this length the central 24-inch section of pipe was inspected. Records were made as to the general character, extent and severity of corrosion and of the principal conditions affecting corrosion in that location. The depths of many deepest pits were measured and recorded, generally 30 in each 24-inch section. This number was chosen as necessary to insure a dependable knowledge of the depths of the deepest pits. In measuring these pits special care was exercised to clean them

out thoroughly at the bottom thus insuring a full measure of depth.

"The depreciation sustained by the pipe lines was determined from a consideration of the field inspections above described. The records of the field work were tabulated and summarized. They were subjected to study and analysis both scientific and practical. Consideration was given to the many factors affecting depreciation through corrosion which are described in the succeeding paragraphs.

"Renewals of pipe are most commonly the result of a troublesome succession of leaks caused by corrosion. As leaks occur they are stopped by bolting band clamps around the pipe with a rubber backing over the leaks. Sometimes two or more leaks develop at widely separated dates in the same joint of pipe. The development of leaks first occurs in stretches of lines where for various reasons local conditions are favorable to corrosion. These are called 'hot spots' and range from a few joints to thousands of feet in length. When the leaks occur with troublesome frequency not only is the pipe in the 'hot spot' itself removed but also pipe for an appropriate distance on either side. In practice the worst joints of pipe may have two or more leaks. Stretches of pipe 100 feet long may contain five to ten leaks and other stretches may have no leaks at all. Some pipe is suitable for reuse with a simple cleaning operation, some requires welding the pits before it can be reused and other pipe is reduced to junk.

"The progress of corrosion has universally been found to fall off with age. When pipe is first buried it starts to corrode rapidly. As time goes on the intensity of corrosion slows down. Not enough inspections were made of the Company's lines nor was there enough range in age to permit a field determination of the extent to which this corrosion slows down. However, the United States Bureau of Standards has investigated this characteristic of slowing down in corrosion as related to 47 soils scattered throughout the country. There were only 6 soils found in which the depth of pits increased

more than 50 per cent through doubling the age and these soils are decidedly unusual in their characteristics. In soils characteristic of Canadian River's territory the increased depth with doubling the age was much less than 50 per cent. Accordingly, it was considered in determining the depreciation accumulated in the Company's pipe lines that corrosion would slow down to such an extent that doubling the age would result in not more than a 50 per cent increase in the depth of pits.

"It is also the universal experience that the greater the lengths of pipe examined on inspection the greater will be the average depths of the deepest pits found. A study of the relative depths of the deepest pits in the 24-inch sections was made, from which was determined by scientific analysis the average depths that could be expected in greater lengths of the Company's pipe of 10, 20, 40 or 50 feet, as the case may be. This study also determined the number of pits required to be welded in reconditioning.

"Through a correlation and application to the field insections of the rules of corrosion outlined above by the proper use of engineering methods, it was determined that the Company's production system pipe lines had depreciated 7 per cent.

"Field Compressor Station Equipment

"The condition of this equipment was determined by field inspection and observation of all parts above ground. Underground piping was conditioned as having 23 per cent greater depreciation than the field line pipe, the difference having been determined from a comparison of the condition of the underground pipe in the main line station at Bivins and the transmission line pipe.

"Minor Property Accounts

"The depreciation existing in the minor property accounts was in general determined by observation as in the major accounts, in detail appropriate to the importance of the respective accounts.

"General Construction Costs

"The depreciation determined as having accumulated in Canadian River's depreciable property is based on the system as a continuing property without important change except as to extensions. Items of equipment retired in such property in the natural gas business are commonly replaced in kind and accordingly only a portion of the undistributed construction costs depreciates with the property itself. The replacement of that property involves little or no engineering cost and little or no interest. Portions of the property, however, that are retired and replaced with property of a different type, which occasionally takes place, involve a repetition of most of the undistributed construction costs. All things considered, one-half of the total amount of undistributed construction costs is appropriately considered as depreciating with the depreciable property.

"General construction costs applying to the original cost of depleted items have been depleted with the property to which they apply.

"Adjustments to Original Costs

"To apply the determined extent of depreciation and depletion to original cost it was necessary to segregate therein certain general construction costs which had been distributed to the several accounts, which adjustment is shown on the attached Exhibit No. 2.

"The general property allocated to systems in Exhibit No. 183 has been adjusted and reallocated on Statements Nos. 3 and 4 herein on account of the Fritch and Masterson Camps which were not included as part of the general property in Exhibit No. 68.

"Summary

"The percentages of depreciation accumulated in the depreciable property and the percentages of depletion accumulated in the depletable property are summarized and applied to original costs account by account on Statement No. 1 to obtain the accumulated amount of depreciation or depletion shown the several classes of

property. The total accumulated depreciation and depletion in the original cost of the producing and gathering properties of Canadian River Gas Company at December 31, 1938, herein considered, determined as set forth above and supported by Summary Statement No. 1, amounted to $3,069,697."

Roberts was examined and cross-examined at length on Exhibit No. 272 and his statement with reference thereto quoted above. (Vol. LXXXXIV, pp. 14413-14438; Vol. XCVII, pp. 15023-15122; and Vol. XCVIII, pp. 15214-15240.)

Roberts restated that he had depleted the leaseholds, wells and well construction account in accordance with the methods described by him in his general statement which was a new computation different than in any of the exhibits on reproduction costs of the Denver pipe line properties, but that with respect to the gathering lines, the compressor stations and the general property and other miscellaneous properties, the same methods were used in arriving at depreciation, as testified to by Mr. Rhodes when he explained such methods in connection with his Exhibit No. 68 concerning Canadian properties and Exhibit No. 70 concerning Colorado Interstate properties. The percentages of depreciation set forth in the exhibit were those arrived at and the conclusion reached by Mr. Rhodes and Mr. Roberts as a result of observations of their assistants. The Masterson and Fritch camps are not in Exhibit 68, so depreciation as to them after conference with Mr. Rhodes was determined separately on the same basis of depreciation as set forth in Exhibit 68. Mr. Rhodes' explanation with reference to Exhibits 68 and 70 is applicable to Exhibit 272. (Vol. LXXXXIV, pp. 14431-14433.)

Mr. Roberts was in charge of field work under Mr. Rhodes and worked with him in setting the final figures for depreciation. Most of the work was done in 1939. (Vol. XCVII, p. 15028.) In most other instances in which he was connected with the valuations of property there was involved an estimate of reproduction cost new. (Vol. XCVII, p. 15037.) In connection with the field inspections indicated in Exhibit 272 this involved an inspection of the major buildings, the pipe lines and the measuring stations, a chronological list of which was made and an inspection made

of every fourth building and measuring station in the order in which constructed. The accumulated depreciation figure given in Exhibit 272 is the converted per cent condition used by Mr. Rhodes in his reproduction cost new estimate; that is, where there is a 93% condition related to reproduction cost new, there is a 7% accumulated depreciation figure. (Vol. XCVII, p. 15038.) Mr. Roberts did not, except in one instance, accompany the inspection gangs on the inspection trips. These were in charge of Mr. W. T. Smith of FB&D. The method, however, was the same, as explained by Mr. Rhodes in his testimony. (Vol. XCVII, pp. 15039, et seq.) In connection with the pits discovered by inspection in the pipe lines it was not necessary to determine the age of the pits in order to determine the condition of the pipe lines or the percentage of depreciation, as the age of the pits under the method used was immaterial. (Vol. XCVII, pp. 15042, et seq.)

WITNESS ROBERTS testified on cross-examination: (Vol. XCVII, p. 15030.)

Q. Now, in connection with these several valuation matters in which you participated, did you ever have occasion to compute any service lives of property, units of property?

A. Service lives?

Q. Yes.

A. I have done some studies on the amount that the companies wished to set up on their books for depreciation rate.

Q. Involving the computing of service lives as an engineering matter?

A. Just a determination of what was the proper allowance to set up on the books to cover depreciation.

WITNESS ROBERTS further testified on cross-examination: (Vol. XCVII, pp. 15040-15045.)

Q. I want particularly to confine myself at this time to the method that you pursued in relating those inspection figures to your so-called accumulated depreciation.

A. This was done in exactly the same way as it was done on the estimates of reproduction of the Canadian River transmission, and the Colorado transmission—exactly the same as Mr. Rhodes testified.

Q. You followed the same theory that he had with reference to the deceleration of the corrosion that takes place in the field lines?

A. That's correct.

Q. In other words, your inspection made in 1939, related the per cent condition as of December 31, 1938?

A. That is correct. At least, we used it for that.

Q. You used it for that. Well, now, these determinations as to corrosion, as I recall Mr. Rhodes' version of that, you determined that after a certain period of time corrosion would decelerate, is that right?

A. No, not exactly that, not after a certain period of time.

Q. Well, when?

A. As soon as the pit is started it forms a little protection there and the penetration from that time on slows up.

Q. It decelerates, then, as he put it?

A. That's right.

Q. How long will that continue before the deceleration begins; or, once you have a pit, how long will it be before there will be deceleration?

A. As soon as the pit starts, there is sort of a scale that usually forms over that and there are other factors that enter into it, it decelerates at that time—it doesn't decelerate at that time, from that time on it decelerates.

Q. From what time on?

A. From the time there is some pit starting and some material in that pit.

Q. In other words, prior to that time there is acceleration of the pit, or what takes place?

A. It is not acceleration. When the pipe is put in the ground—

Q. All right.

A. —the depreciation starts—

Q. What do you mean by the depreciation starts?

A. I mean depreciation. The principal thing being pitting, one of the principal things—

Q. When you say "depreciation," you mean the pitting starts?

A. The pitting would start, and when that starts, usually in a pit there is some scale and other matter which tends to decelerate that.

Q. All right, now, at the time you made this inspection of the field lines in 1939, how could you determine how long

any of those pits had been—or, how long prior to that time the pits had formed?

A. I didn't need to know.

Q. You didn't need to know that?

A. No.

Q. Why?

A. Because I know from that time on it was going to decelerate and by doubling the age the pit would only go half again as far as it had gone.

Q. Yes, but if you didn't know when that pit had actually started on its course on that pipe, how do you know when it will stop?

A. I don't need to know that. I don't need to know when it is going to stop.

Q. Well, then, how can you determine your per cent condition of that pipe, or the depth of the pit, or how far that pit will eventually go?

A. I know because there is a certain depth at that particular time, and we used a formula which is a very conservative formula of doubling the age that the pit would only penetrate fifty per cent further.

Q. Although you don't know how long that pit had been in the actual process of either forming or how long it had been on the pipe at the time you made your inspection?

A. There is a period covered there. It could be from zero to a hundred and it might be from 1 to 50, but the relation between those things is what we got.

Q. You pay no attention or give no consideration whatsoever in making that determination as to that pit inspection as to how long the pit had been on the pipe at the time of the inspection?

A. No, sir.

Q. It is not necessary to do that to arrive at your per cent condition in utilizing your formula?

A. No.

Q. And the time element doesn't enter into that at all?

A. Time is expressed as the speed of the penetration. As I stated, it decelerates. Of course, the deceleration, the time element is considered in that, but that is the extent, the rate is something having to do with time—speed.

Q. Some of these pits you inspected in 1939 were still in the process of decelerating at that time?

A. In 1939?

Q. Yes.
A. Yes.
Q. Well, how much further, then, in the future will that deceleration continue?
A. How much?
Q. Yes, how long?
A. It would continue to decelerate until the time it becomes necessary to remove the pipe, when the pit has gone through the wall, and at such time as it is advisable to remove the pipe. Of course, then the pipe is out.
Q. That is true, but this inspection made in 1939 where you found certain pits that were at that time decelerating, that deceleration would continue for some period in the future?
A. Yes.
Q. Do you know how long?
A. I didn't need to know how long.
Q. You didn't need to know how long?
A. No, all I was interested in was when it would get through the pipe.
Q. You didn't need to know in determining your per-cent condition how long that would take?
A. No.
Q. And in determining that per cent condition you arrived at it from that particular physical inspection?
A. From the inspections and correlated data.
Q. And you didn't take into consideration the age of the pipe; how long it had been in the ground?
A. No.
Q. You limited your determination of per cent condition to that physical inspection?
A. And other correlated facts.

WITNESS ROBERTS further testified: (Vol. XCVIII, pp. 15241-15278.)

Q. You have Exhibit 274 before you, Mr. Roberts?
A. I have, Mr. Lange.
Q. This Exhibit 274, as I understand it, relates to the accumulated depreciation as you state, on an hypothetical resale system applicable to the producing and gathering facilities of Canadian River Gas Company?
A. That isn't what the exhibit reads.
Q. Well, what does it—

A. It says: "Canadian River Gas Company accumulated depreciation and depletion and its application to equivalent original cost of producing and gathering facilities for resale gas alone as of December 31, 1938."

Q. Maybe I should have stated it differently. I will ask you this, then, first: The producing and gathering facilities of Canadian River Gas Company have not been utilized exclusively for resale gas alone, have they?

A. No, sir.

Q. Neither in the past nor at the present time?

A. No, sir.

Q. Very well. This exhibit contemplates, however, the use of those facilities for resale gas alone?

A. Yes.

Q. And sets forth some difference, first of all, in property units as distinguished from the use of these facilities for all gas?—as set forth in Exhibit 272. Isn't that correct?

A. Yes, sir, it is based upon the property described in Exhibit No. 121 by Mr. Max K. Watson and their application to the equivalent original cost as presented in Exhibit 193 by Mr. William A. Lusk.

Q. Yes, and the difference in property units that would be utilized under a resale system alone is set forth in Mr. Rhodes' Exhibit 98, isn't it? Isn't that correct?

A. 98?

Q. Yes.

A. I don't recall that exhibit.

Q. "Denver Pipe Line for Resale Only." I beg your pardon, that doesn't apply to production and gathering properties.

A. That refers to Exhibit 121 by Mr. Max K. Watson.

Q. Now, I note that under Statement 1, "Leaseholds," Item 1, you have original cost of leaseholds in your Exhibit 274 at $5,075,906 and accumulated depletion of 36 per cent, converted to dollars, $1,827,326, is that right?

A. That's right.

Q. Well, I see that that is exactly the same, both original cost as well as accumulated depreciation that you have on—depletion, I mean—

A. Yes, sir.

Q. —that you have set up in your exhibit 272 applying to sales of all gas.

A. That is correct.

Q. Would you include the same property here for the resale gas as you do to the sale of all gas?

A. Yes. I applied these percentages to the original cost in the exhibit prepared by Mr. Lusk, No. 193.

Q. Yes, you utilized the same figures that Mr. Lusk has set up which in turn contemplated no allocation whatsoever as between the utilization of these—of this item of property—these leaseholds, for all gas, as distinguished from resale gas alone?

A. No. Those leaseholds would have been required for resale gas alone.

Q. All of the leaseholds?

A. Yes.

Q. All right, then, in your opinion would those leaseholds have lasted just as long and you would have had the same accumulated depreciation applicable if you related the use of all gas, or to resale gas alone?

A. Taking this property as a whole, why, those percentages would apply against both.

Q. All right, let's say that your opinion is correct, that you would have to have all of the leaseholds in each instance for all gas as well as resale.

A. Yes.

Q. All right, but then we move to your depletion of those leaseholds. How can you say that you would deplete those leaseholds exactly in the same fashion for the same period of time in the resale gas estimate alone as you do for the all gas estimate?

A. If there is drainage in the field and they didn't take it out for one purpose, someone else would take it out for another purpose.

Q. Well, then, the matter of withdrawal or the rate of withdrawal didn't interest you at all, did it?

A. I took the withdrawals each year as compared to the reserves at the start of that year.

Q. Don't you think there would be a different rate of withdrawal in connection with contemplation of all gas sales as distinguished from resale gas sales alone?

A. This refers to the withdrawals for all types of gas.

Q. Yes, I know, Exhibit 272, but when you move over to Exhibit 274 you are limiting yourself to resale gas alone.

A. This is the property which would be required for resale gas alone.

Q. I say, let's assume for the sake of argument you would have to have those same leaseholds.

A. Yes.

Q. But you would still deplete those leaseholds in the same fashion at the same rate and on the same basis whether they applied to all gas sales and the withdrawals under that as distinguished from your resale gas sales and the withdrawals under that character of system?

A. That's what I have done in this exhibit, applied the same percentage of depletion.

Q. All right, even though you had the same base. What I want to know is whether in your opinion that would be a correct calculation in both instances; be exactly the same depletion?

A. That is so considered here.

Q. I know, but you set this up. I want to know what opinion or reason you have for that.

A. I have taken the field as a whole and based it on the basis of withdrawals.

Q. You made no distinction as between the withdrawals that would take place under resale gas distinguished from all gas sales?

A. These are both depleted the same.

Q. Well, are the withdrawals at the same rate under resale as they are under all sales?

A. Withdrawals from the field are.

Q. They would—you say—

A. I say, they have been. I based this on the actual withdrawals from the field.

Q. That is in your Exhibit 272, where you have all gas. Now we are moving to Exhibit 274 where you confine yourself to resale gas alone. You say the rate of withdrawals are the same?

A. It is based upon the amount of gas that was taken from those leases—from the entire field.

Q. This is just an assumption under Exhibit 274. You had no experience there.

A. I have applied the same rate of withdrawals as I did the other exhibit.

Q. I want to know why. That's the whole thing, I just want to know why.

A. Because that represents the fair amount of depletion applying to those leaseholds.

Q. And it bears no relation to what the difference would be under such a system?

A. Will you repeat that?

Q. It bears no relation to what the difference in rate of withdrawals or amounts there would be under a resale system?

A. Well, if the gas wasn't withdrawn for one purpose it might have been withdrawn for another purpose. It still would have been depleted.

Q. But your problems as to field are in the picture in your Exhibit 272 where you have accurate figures on withdrawals.

A. Yes, sir. We have taken those same ones as the withdrawals as applying to these leaseholds.

Q. You computed your depletion in Exhibit 272 on actual figures. You had actual figures on withdrawals in Exhibit 272, didn't you?

A. As accurate as the geologists could give us.

Q. And you began with an estimate or estimates of your geologists as to reserves?

A. Yes.

Q. And computed your figures in Exhibit 272 to give you the accumulated depletion?

A. That is right.

Q. Now, then, you have no actual figures, or none at all, as to withdrawals that would occur under your resale estimate, do you?

A. Those leases would have been required for—

Q. I am not asking you about the leases. We'll concede you would need the same leases just for the sake of argument. We don't concede it, but for the sake of argument, the same leases are there.

A. We might have reduced the amount of depletion there. That wouldn't have—

Q. You would have?

A. We could have done it another way.

Q. You could have, but you didn't.

A. I think this is the proper way.

Q. You didn't take into consideration, then, what such withdrawals would be as distinguished from your all gas sales?

A. I took the total withdrawals from the field to date.

Now, if you had taken less withdrawals there, you couldn't have had as much depletion.

Q. And your accumulated depletion would have been different in your Exhibit 274?

A. I would have had less accumulated depletion.

Q. Yes. How much less?

A. I haven't figured that out.

Q. Oh, you haven't? This depletion study in connection with leaseholds as set forth in both Exhibits 272 and 274, the rate of withdrawals would have a very distinct bearing upon the life of the field or the life of the—the producing life of the acreage of Canadian River Gas Company?

A. If you didn't withdraw so much gas—

Q. It would last longer?

A. The whole field would last longer.

Q. That is right. Now, these units of property that you set forth in Exhibit 274 that differs from those in Exhibit 272, how were you able to arrive at your per cent condition of those units of property which do not in fact exist?

A. They are such a small part of the property that they wouldn't affect the overall conditions we have used.

Q. They would not?

A. No.

Q. So you just assumed the same per cent condition would obtain there as did in Exhibit 272, although the units of property don't exist and you couldn't apply your method of physical inspection?

A. The majority of the units do. It is just a slight change in the property which wouldn't affect the overall condition enough to make any adjustment.

Q. But you were not able in connection with the construction of Exhibit No. 274 in determining your accumulated depreciation on any of these units of property to actually inspect the property?

A. To actually inspect it?

Q. To physically inspect it.

A. We did inspect those properties.

Q. These properties applicable to resale gas alone differ from the units on the other, the latter are in actual existence?

A. These are the same properties with an elimination of a few items.

Q. Which items?

A. There were some wells that were eliminated and

maybe a small meter station and maybe one small well line. The difference between the two, from $10,141,515 total for resale alone is $10,042,308, so the percentage change there is negligible.

Q. This Exhibit No. 274 reflecting your computation of accumulated depreciation and depletion of production and gathering system facilities is limited to resale gas alone and is not applicable to any operating conditions of the Canadian River Gas Company?

A. Not applicable to operating—

Q. Not applicable to any operating conditions of the Canadian River Gas Company?

A. It is the same property except for those items that I said were not needed for resale.

Q. But it contemplates an assumed limited operating condition of the property?

A. It contemplates what property would have been required for resale gas alone.

Q. Which has not taken place in fact?

A. No, they are still selling direct sale gas.

Q. They haven't at any time in the past limited the use of the facilities to that purpose?

A. No, sir.

Q. As far as you know they don't contemplate limiting it in that fashion?

A. Not as far as I know.

Q. It is being used and has always been used for resale as well as all sale?

A. The entire properties have been. This part is the amount that would be required for just resale alone.

Q. But these facilities have never been limited to resale gas operations alone?

A. The entire properties haven't, no.

Mr. Lange: No further questions on that exhibit.

Redirect Examination.

By Mr. Dougherty:

Q. Mr. Roberts, are you familiar with the quantity of direct sale gas the Colorado Interstate sells a year?

A. I have seen the figures but I am not good in remembering figures.

Q. It would be an easy computation to take that quantity and subtract each year from the total field withdrawals and

determine what, if any, variations in your 36 per cent would result, would it not?

A. Yes, sir.

Q. And assuming for the moment the amount sold each year to the direct sale customers was about 10 billion feet with an average of around 600 billion feet a year sold, or total field withdrawals. That is around 600 billion Mcf. per year. Now, if you had 10 billion off that, could you tell me at about what fraction or percentage that might make in each year?

A. It would be under two per cent; a little over one per cent.

Q. That is over the whole period?

A. Over the whole period, yes.

Q. It would be somewhere above 34 per cent and under 36 per cent?

A. That should be applied, I believe, against the 36.

Q. And—I see what you mean. And subject to your computation—

A. It would be one per cent of 36 per cent.

Q. Subject to your computation as to what it would be, this method you have used gives a greater amount of accumulated depletion than if you had made the deduction of the direct sale gas from the total field withdrawals each year?

A. Yes, I believe I have stated that.

Mr. Dougherty: That is all I have.

Mr. Lange: Just one other question.

Have you made any computation to show what accumulated depletion would be as applicable to direct sales alone?

The Witness: No, sir.

Mr. Lange: That is all.

The Trial Examiner: We will stand in recess for five minutes.

(At this point a short recess was taken, after which proceedings were resumed as follows:)

The Trial Examiner: The hearing will be in order.

Mr. Lange: I have just one other question on Exhibit 274.

The Trial Examiner: All right.

Mr. Lange: As I understand it, you pursued in the same fashion the computation of your accumulated depletion and depreciation in constructing Exhibit 274 as you did in constructing Exhibit 272; that is, you applied the same general principles?

The Witness: Yes, sir.

(Witness excused.)

Whereupon—

H. E. ROBERTS

recalled as a witness by and on behalf of the respondents, having been previously duly sworn, was examined and testified further as follows:

Cross Examination.

By Mr. Lange:

Q. We will take up Exhibit 273. That is the Denver line property of Canadian River Gas Company?

A. Yes.

Q. You have that exhibit before you, Mr. Roberts?

A. I do.

Q. Turn to your Statement 1.

A. Statement 1?

Q. Yes.

A. All right.

Q. Let's first go to your written statement, Page 2, the second paragraph—I mean the paragraph beginning with "Original cost as given by Mr. Lusk in Exhibit No. 267 were first rearranged to separate the general construction costs from the direct account costs as shown on Statement 2." Where do you make that rearrangement in Statement 1?

A. There is a notation over Columns 5, 6, 7, 8, and 9, Deduct General Construction Costs. They were deducted from the original cost of Exhibit 67 which first had been further divided and included with the general construction costs down below.

Q. That is in Statement 2 of the exhibit?

A. Yes.

Q. In other words, the treatment of those items was handled in the same fashion as in Exhibit 272?

A. Yes, sir.

Q. And in that connection you of course separated those general construction costs and set them apart differently from the way they are presently reflected on the company's books?

A. Yes.

Q. In all other respects you proceeded in the same fashion in setting up your accumulated depreciation of the several units of property in this Exhibit 273 as you did in the previous exhibit?

A. That is correct.

Mr. Lange: I think that is all on Exhibit 273.

The Trial Examiner: You have no questions, Mr. Dougherty, on Exhibit 273?

Mr. Dougherty: No.

(Witness excused.)

Whereupon—

H. E. ROBERTS

recalled as a witness by and one behalf of the respondents, having been previously duly sworn, was examined and testified further as follows:

Mr. Lange: We will proceed with Exhibit 275.

Cross Examination

By Mr. Lange:

Q. That related to the determination of accumulated depreciation applied to the Denver pipe line for resale gas alone?

A. That is correct.

Q. I believe it is in connection with that exhibit that the different units of property are set up by Mr. Rhodes in his Exhibit 98 to distinguish them from units of property actually in the line at present, is that true?

A. I believe that is the exhibit, No. 98.

Q. You referred to it in your written statement?

A. That is right, yes.

Q. Now, then, let's turn to Statement 1, Exhibit 275. Item No. 6, Transmission Line Equipment, Account 226, is the largest item of property that contemplates maintenance?

A. Yes.

Q. Under Mr. Rhodes' classification or distinction of the property to be utilized on a resale plant set up, you would have 20-inch main line in lieu of the present 22-inch main lines, wouldn't you?

A. That is correct.

Q. And your total original cost would differ materially for that item, too?

A. Yes, because there is a reduction in cost.

Q. About $300,000—in Exhibit 273, it is $2,313,572 and in your Statement No. 1 of Exhibit 275 it is $2,002,808.

A. That's right.

Q. I note that in both cases your per cent accumulated depreciation is the same, seven per cent.

A. That's right.

Q. Now, the line contemplated in your Exhibit 275 devoted to resale gas alone would be a 20-inch line that is presently not in existence.

A. It is a line that would have been in existence if they constructed that line for resale gas alone.

Q. And this item on Statement 1, "Transmission Line Equipment," that you have shown to have a seven per cent accumulated depreciation is presently not in existence.

A. We simply reduced the size and assumed that that pipe would be in the same location as this present line, which would have been under the same soil conditions as this same particular line, but would not offer as much surface to those soil conditions as a 22-inch line.

Q. It would be 20 inches in diameter as distinguished from 22 inches?

A. That's right.

Q. So without having had any opportunity to make an inspection of this assumed 20-inch line, you give it the same per cent condition as you did the 22-inch line that is in place?

A. I believe it is a fair assumption that if you had that one pipe line in there that was 20 inches and another in there that was 22 inches, it would be under the same soil conditions, the same kind of pipe, there would be less surface of that pipe exposed to the soil as in the case of the 22-inch. In the case of the 20-inch line there would be less surface exposed to the soil conditions than in the case of the

22-inch line; so we have given it the same accumulated depreciation.

Q. That is purely an assumption. You didn't have an opportunity, or couldn't have had an opportunity to make any calculations on that.

A. We inspected the 22-inch line in the place that the 20-inch line would be, under the same conditions, the same materials, and it seems to me it is a reasonable assumption that the pitting wouldn't have been any more in the 20-inch line than in the 22-inch line.

Q. So in that connection you had to base an assumption on an assumption. First, you had to assume that there would be a 20-inch line in lieu of the 22-inch line and then you had to assume what the per cent condition of the 20-inch line would be if constructed.

A. We were the engineers that designed this line and we came to the conclusion that the 20-inch line would have been built at that time if it were being built for resale gas alone; so it isn't a very far-fetched assumption on the first part, and on the second part it doesn't seem to be a far-fetched assumption because of the fact, as I have stated before, that line would have been placed in the exact same soil, and it would have been of the same material.

Q. And without having had any opportunity to make any actual inspections, you give it the same per cent condition?

A. We gave it the same per cent conditions that we found for the 22-inch pipe that was there in that same location under the same soil conditions.

Q. And I notice that Item 3, Statement 1 of Exhibit 275, "Compressing Station Equipment," that differs materially—well, not very materially, but to some extent, from your Exhibit 273. You have given that the same per cent condition also, haven't you?

A. $34,000 difference there, approximately.

Q. In what respect does that unit differ on your resale gas—what physical difference?

A. I think that there was one 600-horsepower unit as I recall it that was deferred to a later date.

Q. One less unit, isn't there, in place there? You contemplated to have one less unit?

A. Yes.

Q. So the—

A. That is a small unit there, not the 1,000-horsepower unit. It is a 600-horsepower unit.

Q. Did you take into consideration the difference in the volumes of gas that would be compressed in the resale gas alone as distinguished from all gas?

A. I didn't myself make that calculation. I applied it against the calculations that had already been made and the information which Mr. Rhodes gave in his Exhibit 98.

Q. Well, what I was getting at, how do you know that the compressor units that would actually be in operation would be required to compress the same Mcf. of gas for each system?

A. I say, I didn't make that calculation. Mr. Rhodes did.

Q. Mr. Rhodes made that?

A. Yes.

Q. But you related the accumulated depreciation—you had to satisfy yourself on that, didn't you?

A. I applied it against the property. It was practically the same property with the elimination of that one unit.

Q. Did you just take Mr. Rhodes' per cent condition on that particular unit without giving any other consideration at all, and just mathematically calculated that?

A. No. It was $34,000 against $504,000, a difference that would hardly affect the overall condition.

Q. Well, what I want to know is, did you just take Mr. Rhodes' per cent condition and convert it into dollars?

A. I applied the same per cent condition because the difference in the property was so slight and it was going into too fine a detail to try to figure out a fraction of a per cent on the condition of the property.

Q. That was probably in dollars, the cost of the two items, but what consideration did you give to the difference in operating conditions that would obtain?

A. I didn't give any consideration—

Q. Well, didn't that have a very—isn't that a very material matter to take into consideration as to compressor units?

A. In just what respect do you mean?

Q. Well, don't you take into consideration at all the conditions under which compressor units operate in determining the per cent condition or accumulated depreciation in each of those units?

A. We considered that if they were overloaded and

worked under overloaded conditions probably at the time we observed the conditions we would have found more depreciation.

Q. Yes, it is very necessary to determine the character of operation and the size of the load and the rate at which the units are operated to tell what the condition of those units is.

A. You determine that at the time you look at them.

Q. But you didn't have available for your inspection that substitute plant.

A. It takes a wide fluctuation in load, as I say. If the machinery is overloaded and wasn't being taken care of properly, why, that would affect the condition to a certain degree, but ordinarily variable loads would not affect the condition.

Q. You don't know to what extent those units are going to be called upon to deliver under your proposed resale plant?

A. Mr. Rhodes made that calculation and he would assume that they would be under the normal operating conditions.

Q. But you then just again, just took his per cent condition and just by applying simple arithmetic determined what you say is the accumulated depreciation in these units that will be installed in a resale plant?

A. I considered for resale these engines would be operated similar to the way they are operated for the combined gas.

Q. Regardless of the rate of flow of gas or the demand that would be made on these units?

A. I considered that the difference would not be sufficient to make any refinement.

Q. And of course you had no opportunity to make those refinements?

A. Well, Mr. Rhodes determined what units would be required and he wouldn't have had—he would have put in sufficient units to handle the load.

Q. And in the construction of this exhibit, again, you applied the same methods and principles as you did in the previous exhibits in computing your depreciation?

A. Yes, sir.

Mr. Lange: I believe that is all.

Redirect Examination

By Mr. Dougherty:

Q. Mr. Roberts, there are some blanks that ought to be filled in on the bottom of the schedules referring to other exhibits which I don't think we have done yet. Turn to Exhibit 273, Statement 1, Note (B). There is a blank there. The statement says "As shown on Statement No. 3, Exhibit No. blank relating to depreciation and depletion of original cost." What number should be in there?

A. 272.

Q. 272?

A. Yes.

Q. And then on Statement 2, also, Note (E).

A. Well, will you refer again to that Exhibit 273? I don't see that. Where is that shown?

Q. On Statement 1, at the bottom of Statement 1, Exhibit 273, Note (B) at the bottom of the page, Statement 1.

A. Yes, that is correct, referring to Statement 3, Exhibit 272.

Q. At the bottom of the page of the same exhibit, in Statement No. 2, Note (E), what should go in there? What other exhibit does that refer to? Is that Exhibit 272 also?

A. Yes, Exhibit 272.

Q. Now, then, Exhibit 274, on Statement 1, there is a Note (B) at the bottom that refers to general property also.

A. That refers to Exhibit 272 also.

Q. And then also on Statement No. 2, Note (C), that refers to general property also.

A. Yes, that's Exhibit 272.

Q. And then on Exhibit 275, Statement No. 1, you again have a reference to general property in your Note (P).

A. That refers to Exhibit 272 also.

Q. And then on Statement No. 2, Note (E), at the bottom, should that also be 272?

A. That also refers to the same exhibit, 272.

Mr. Dougherty: If the reporter could, Mr. Examiner, make those notations in the exhibits—

The Trial Examiner: Yes, we'll have them make the insertions in the official copy.

Mr. Dougherty: I had no questions on that exhibit.

Mr. Lange: We'll take up Exhibit 283 of Mr. Roberts. It refers to the Denver line properties of Colorado Interstate Gas Company.

(Witness excused.)

H. E. ROBERTS

recalled as a witness by and on behalf of the respondents, having been previously duly sworn, was examined and testified further as follows:

Cross Examination

By Mr. Lange:

Q. Exhibit 283 refers to the Denver pipe line properties of Colorado Interstate Gas Company, is that correct?

A. Yes.

Q. You again proceeded in the same fashion as you did in constructing the previously named exhibits?

A. I did.

Q. Now, in connection with the construction of this exhibit I find that during the year 1939 I have a notation as to at least two retirements that were made. I wish you would make a note of that and let me know whether my memo is accurate.

A. All right.

Q. The voucher reference is No. M-36.

A. What year? 1939?

Q. Yes, 1939.

A. All right.

Q. The account numbers covered in that one voucher, are 220-D, 226-D, 222-M, and 225-M. The units of property are the transmission lines and measuring stations in connection with the Littleton lateral and the Santa Fe lateral. The Littleton lateral shows a cost retired of $5,161.89, no salvage; the Santa Fe lateral shows the cost retired at $17,981.70, no salvage.

I find that in both instances those units of property were given a 95 per cent condition in Mr. Rhodes' estimate.

A. Yes.

Q. Now, what I wanted you particularly to make a note of was whether the figures I gave you were correct.

A. Do you want me to find out whether those figures are correct?

Q. All items I gave you, whether I have related the particular units of property to Mr. Rhodes' account number with those percentages of condition as he gave it, yes.

A. I have explained before that the condition we gave represented the average of those accounts and as he set the condition opposite them.

Q. You, of course, made no investigation or gave no consideration to retirements that were made by Colorado Interstate Gas Company during the year 1939?

A. Those particular retirements were handled as retirements of property sold when we adjusted our valuation from 1938 to June 30, 1940. Those properties were sold and we removed them from our reproduction cost inventory.

Q. You removed them from your 1938 inventory?

A. Yes, sir.

Q. How do you know they were sold, Mr. Roberts?

A. I saw the sales agreement, I believe, on the Littleton lateral. One of the men went into the field when the Santa Fe lateral was sold.

Q. According to my memo there is no salvage value on either one of the properties.

A. There wouldn't be if they sold them.

Q. Wouldn't there be any record there as to the amount of salvage if there was a sale made and funds realized for the sale?

A. I didn't quite understand you.

Q. Wouldn't there be any salvage indicated on that voucher at all?

A. They got so much money for the property if they sold it.

Q. How did you determine that the two properties were sold at any particular price?

A. I didn't investigate—

Q. Or at any price.

A. I believe I saw something having to do with the Littleton sale, but I was advised by the company—at least the representative I sent out here was advised by the company that the lines had been sold and we removed them from the inventory when we adjusted from December 1938 to June 30, 1940.

Q. Well, at the end of 1938 they were still in the property, weren't they?

A. They were at that time?

Q. Your inventory as of December 31, 1938 would include them?

A. It would.

Q. You say it is your understanding that they were sold, either one or both?

A. Both were sold.

Q. Will you find out whether that information you have is correct or not; if so, for what they sold?

A. At what price they were sold?

Q. Yes.

A. I guess I can determine that.

Q. I see there is another item of retirement during 1939, voucher reference K-29-8, Account No. 224-C, Compressor Station Equipment, four water wells, 1, 2, 5, and 6, that were retired. The cost of them retired is $11,731.19.

A. As I recall it, those were wells not included in our valuation. I can check that.

Q. I see there is no salvage indicated there, either. That unit of property is given a per cent condition of 88 per cent in Mr. Rhodes' estimate, is it not?

A. I believe you are mistaken but I will check it. As I remember it, we did not include those wells in our evaluation.

Q. You did not?

A. As I recall it we did not.

Q. As of December 31, 1938?

A. That is correct.

Q. Will you make a note of those wells?

A. Yes, I have a note of it.

Q. Under that same voucher No. K-29-25, under "Compressor Station Equipment at River Dam," there is $5,972.83.

A How much?

Q. $5,972.83.

A. That was another item we didn't have in the valuation.

Q. There was no salvage indicated in that unit of property under that account number given an 88 per cent condition in Mr. Rhode's testimony?

A. I believe you are mistaken, as we did not include that dam. I will check on it, though. Maybe I can check it right here.

Q. Please do.

A. That dam was at Canon, was it not? Wasn't it at the Canon water pumping station?

Q. I don't have that in this memorandum.

A. It is the Canon water pumping station we included in Exhibit 70. If you will leaf through here you will find there is no dam included.

Q. What exhibit are you referring to—Exhibit 68?

A. Exhibit 70.

Q. What page?

A. Page 222.

Q. Those two items weren't considered in connection with the preparation of the estimate?

A. They were not included in Exhibit 70.

Q. You will make a check and determine with reference to the other two items?

A. Relative to those wells?

Q. No, the Littleton and Santa Fe lateral.

A. Yes, I will check them. We have Well No. 3, Well No. 4—we didn't have the other wells. I will check into the Littleton situation and find the information on it.

Q. Find the information, please, on the Littleton and Santa Fe lateral.

A. Yes.

Q. In this exhibit as stated by you in your testimony, or, rather, in your written statement in the exhibit, you proceeded in the same fashion as you did in previous ones?

A. That is correct.

Q. In connection with your computation of the accumulated depreciation as set forth in Statement 1 and as referred to on Page 2 of the written statement you recorded the same treatment and proceeded in the same fashion in setting forth those general construction costs upon which you then computed the accumulated depreciation?

A. Yes, it was done the same way.

Q. Then in computing the accumulated depreciation on those general construction costs as set forth in your Statement 1, Line 15, you again assumed that one-half of the general construction cost did not depreciate?

A. Yes.

Mr. Lange: I believe that's all on that exhibit.

Mr. Dougherty: I have no questions.

Mr. Lange: We'll take up Exhibit 284, Mr. Roberts.

The Witness: I have it here.

By Mr. Lange:

Q. That relates to resale gas line of Colorado Interstate Gas Company?

A. That's correct.

Q. Now, in connection with the construction of such a line devoted to resale gas or limited to resale gas alone, there are certain differences in construction as well as units of property that would be made as set forth in Mr. Rhodes' Exhibit 98?

A. That's correct.

Q. And the largest change that would take place, of course, particularly in units of property as well as dollars, would be the transmission line equipment, item 5, of statement 1?

A. That is right.

Q. Now, in connection with this assumed resale line contemplated under your Exhibit 284, you would have a 20-inch main instead of a 22-inch?

A. Part of the line would be reduced from 22 inches to 20 inches and the remainder would still stay at 20 inches.

Q. Now, I note a 5-per cent accumulated depreciation applicable in your Exhibit 284 for the 20-inch main transmission line and that is the same percentage that you relate to acumulated depreciation in your Exhibit 283 of the 22-inch line.

A. That is correct.

Q. Is this just a mathematical computation of Mr. Rhodes per cent condition?

A. No. Mr. Rhodes estimated what size line would have been required for resale gas alone and this pipe line would have gone in the same locations as the 22-inch; would have been under the same soil conditions as the 22-inch, and there would have been less surface exposed to the elements, and the pipe would be the same kind of pipe, and therefore I assumed that the depreciation as applied to the one would apply to the other.

Q. So you proceeded in the same fashion, then, as you did on the resale line of Canadian River Gas Company?

A. That is correct.

Q. And in this instance again, this assumed 20-inch line, of course, does not in fact exist?

A. Well, part of the 20-inch is the same as the 22-inch —I mean of the gas for resale alone there would be required the same 20-inch line as there now is, but the 22-inch would be reduced in size.

Q. That's what I mean. The present 22-inch line would be substituted by a 20-inch line.

A. That's right.

Q. And that assumed substitution of the 20-inch line does not in fact exist?

A. No, that is a 22-inch line at the present time.

Q. I note that there would be no difference in compressor units at all.

A. No other units would be required for resale according to the estimate that Mr. Rhodes made.

Q. You contemplate the exact same compressor units for both lines?

A. I believe that that must be right. They are both the same figures.

Q. Would they be used in each instance; that is, in connection with all sales as distinguished from resale gas alone in the same manner?

A. They would be used for the same purpose. More gas would go through the compressors if you had the combined sales than there would if you had just the one.

Q. Well, in determining this per cent condition on compressor station equipment, Exhibit 284, did you give any consideration to the difference in volumes of gas and the rate at which these compressor units would be required to function or operate, in one instance, as compared with the other?

A. No. There might have been some increase in per cent condition if they had been pretty well overloaded for the combined and for the resale they weren't, but that would be a refinement that would be such a small percentage that we did not make any increase in our per cent condition.

Q. Did you attempt to ascertain what the difference in volumes of gas would be?

A. Mr. Rhodes did that.

Q. Oh, he did. You just took his figures, then, after he had arrived at the particular conclusions made?

A. I knew that if you had the same units and had less gas, you certainly wouldn't be using the units harder than you would before.

Q. Well, did you have before you any figures estimating the difference in volumes of gas?

A. Well, we know that the combined gas is more than the gas for resale alone.

Q. You mean the present combined volumes of gas that you have actual records of?

A. Yes.

Q. But you were setting up an assumed resale gas line alone, weren't you?

A. Yes.

Q. And you didn't make any estimate as to the volumes of gas that would be required or that there would be a demand for, or the peak load of such resale plant, did you?

A. No, sir. Mr. Rhodes took that into his calculation when he figured the property would be needed.

Q. And he did all of that himself? You just took his figures, then?

A. Well, I knew that the compressors wouldn't have to pump as much gas because there would be less gas involved on resale gas alone than there would be for the combined.

Q. That's it, and the volumes of gas that a compressor unit is required to handle or the peak load conditions of the line, have a very material bearing on what the condition or the per cent condition of the compressor unit handling such gas is, isn't that true?

A. I have stated before that if it has been overloaded for long extended periods there is liable to be more depreciation, but for ordinary operations any difference in condition is so slight that it could hardly be determined.

Q. But you did know that the demands that would be made upon the compressor units for resale plant alone would be different than those that would be made upon these particular units for all sale gas?

A. I assumed that the difference would be so slight that it wouldn't affect the condition as a whole.

Q. It would not?

A. No.

Q. And for that reason you just gave them the same per cent depreciation?

A. They are the same items. They are the same compressors and they would be used practically the same way.

Q. And of course you couldn't have had an opportunity to have any record of performance under the assumed conditions. That would be, of course, impossible.

A. I could have estimated what it would have been if I wanted to go into the condition of those engines. I didn't do that, however.

Q. Knowing there would be a difference, you didn't think it was of sufficient amount to justify making any change in your per cent of accumulated depreciation applicable?

A. That's correct.

Q. And is that the approach you had to any of the other units of property that differed from the all sale gas properties of the Colorado Interstate Gas Company?

A. In most cases we found that the condition of these remaining items fell in pretty well with the average and there weren't any items of 50 per cent and others with 90 per cent there. They generally fell pretty close to the average, so the elimination of an item here and there would not affect the condition, and the other amounts in here are small compared with the total, so we applied the same per cent condition to those properties as we had applied in Exhibit No. 283.

Q. Then in all other respects you pursued the same methods and applied the same principles in the construction of Exhibit 284 as you did in previous exhibits?

A. That's right.

* * * * *

Additional cross-examination of WITNESS ROBERTS appears under title 27 supra.

Depletion, as used in this exhibit as applied against wells, for instance, is based upon the reserves at the time the wells were drilled compared with the reserves at the time the depletion was determined. (Vol. XCVII, p. 15060.) These reserve figures and the figures covering gas withdrawn are covered by Exhibits 206 and 207, Exhibit 206 being Mr. Peterson's exhibit on gas withdrawn, and Exhibit 207 being Mr. Thompson's exhibit on gas reserves estimated recoverable, at 50 pounds gauge. Mr. Roberts ascertained how much gas was withdrawn in a year as compared with the

gas at the start of that year and applied that factor against the investment of leaseholds in that particular year. (Vol. XCVII, p. 15061.)

This Exhibit 272 does not purport to cover amortization. (Vol. XCVII, p. 15066.) Depletion and depreciation are figured differently. The depreciation determined from observation is an accumulated depreciation showing the condition of the property at the time of the inspection and is an average depreciation for all the properties. (Vol. XCVII, pp. 15069, et seq.)

In depreciating the physical properties he did not take into consideration the life of the gas supply but he found the condition of the property from a physical inspection at a particular date. (Vol. XCVII, pp. 15084, et seq.) The determination of accumulated depreciation is not based upon possibilities of retirement of any particular piece of property, but is the average weighted condition of all the property inspected. (Vol. XCVIII, pp. 15085, et seq.)

Gas well construction was depleted rather than depreciated on the same theory as leaseholds because it was impossible to inspect the insides of the gas wells to determine actual physical condition. (Vol. XCVII, pp. 15087, et seq.)

Mr. Roberts was not interested in the method in which the company may have set up depreciation or depletion on its books, as he used what he considered proper and substantial methods. (Vol. XCVII, pp. 15091, et seq.)

In concluding his testimony upon redirect examination Mr. Roberts stated that the percentage of depreciation shown, for instance, on field line equipment is an overall percentage for the whole field pipe line of Canadian and the percentage figure given is not with reference to any particular section or any particular line, but is weighted percentage applicable to the account as a whole. (Vol. XCVIII, pp. 15218, et seq.) Some pipe might be in only a 70% condition and others might be in a 98% condition. His inspection was to determine where between zero and 100% the depreciation or condition of the property existed, and what he did in this case was by observation to determine that the relationship between zero and 100% was 7% for depreciation overall. (Vol. XCVIII, p. 15219). When the inspections of the Canadian pipe line were made the engineers of the FPC

were present and made observations of their own. (Vol. XCVIII, p. 15220.) When the depreciation of the physical condition is determined, it is then necessary to apply the percentage of depreciation to a dollar figure in order to determine the amount of depreciation in dollars. This has been done by applying the percentage of depreciation and depletion, determined as above, to original cost adjusted, as shown by Statement No. 1 in Exhibit 272. (Vol. XCVIII, p. 15221, et seq.)

Further cross-examination of MR. ROBERTS is abstracted under title 27 supra.

Accumulated Depreciation and Depletion And Its Application to the Equivalent Original Cost of the Producing and Gathering Facilities for All Gas, Except Colorado Interstate's Direct Sale Gas, as of December 31, 1938.

For the Canadian there was introduced and received in evidence (Vol. XCVIII, p. 15279) through the witness, H. E. Roberts, Exhibit 274 captioned as above. This exhibit is prefaced by Mr. Roberts' written statement appearing in the record. (Vol. LXXXXIV, pp. 14434, et seq.)

As explained by Mr. Roberts in his statement, this exhibit covering the subject shown in the heading of this subdivision shows the depreciation and depletion accumulated at December 31, 1938, in the producing and gathering facilities required for all gas, except Colorado Interstate's direct sale gas on the Denver line, as testified to by Mr. Watson and shown in Exhibit No. 121 and as applied to the equivalent original cost of such production and the gathering facilities as shown by Lusk's Exhibit No. 193. The accumulated depreciation and depletion in the production and gathering facilities as of December 31, are shown in Mr. Roberts' Exhibit No. 272. The same percentages of accumulated depreciation and depletion as determined in Exhibit No. 272 have been used in this Exhibit 274.

Further testifying on cross-examination concerning Exhibit No. 274 (Vol. XCVIII, pp. 15241, et seq.) Mr. Roberts reiterated the statements made in his preface to the exhibit, and further testified that no change had been made in the

figures applicable to leaseholds because in his opinion all of the leaseholds would be necessary for the resale gas alone. (Vol. XCVIII, p. 15244.)

Statement No. 1 in Exhibit 274 summarizing the accumulated depreciation and depletion covered by the exhibit is as follows:

Canadian River Gas Company — Statement No. 1

Accumulated Depreciation and Depletion and Its Application to the Equivalent Original Cost of Production and Gathering System Facilities for Resale Gas Alone, as of December 31, 1938.

Summary by Accounts

Item No. (1)	Account No. Company (2)	Description (3)	Original Cost (A) (4)	Accumulated Depreciation and Depletion Per Cent (5)	Accumulated Depreciation and Depletion Amount (6)
		Production System			
1.	205	Leaseholds	$ 5,075,906	36%	$ 1,827,326
2.	211	Gas Well Construction	2,126,986	31	659,366
3.	212	Gas Well Equipment	906,529	31	281,024
4.	209	Field Measuring Station Structures	8,315	17	1,414
5.	215	Field Measuring Station Equipment	46,103	11	5,071
6.	216	Drilling and Cleaning Equipment	24,241	....	.....
7.	218	Field Measuring Station Land	100	....	.....
8.		Total	$ 8,188,183		$ 2,774,201
9.		General Property (Allocated) (B)	56,273	25	14,169
10.		Total Production System	$ 8,244,456		$ 2,788,370
		Gathering System			
11.	206	Rights of Way	$ 13,485	....	.....
12.	213	Field Line Construction	280,540	7	$ 19,638
13.	214	Field Line Equipment	860,376	7	60,226
14.	221	Field Compressor Station Structures	2,969	18	534
15.	224	Field Compressor Station Equipment	13,779	16	2,205
16.		Total	$ 1,171,149		$ 82,603
17.		General Property (Allocated) (B)	44,781	22	9,855
18.		Total Gathering System	$ 1,215,930		$ 92,458
19.		Total Production and Gathering Systems	$ 9,460,386		$ 2,880,828
20.		General Construction Costs Applicable to Production and Gathering Systems	581,922		159,813
21.		Total Original Cost of Production and Gathering Systems	$10,042,308		$ 3,040,641

Notes: (A) As shown in Exhibit No. 193 adjusted as shown on Statement No. 2 attached.

(B) As shown on Statement No. 3 of Exhibit No. 272 relating to Depreciation and Depletion of Original Cost.

With further reference to this exhibit Mr. Roberts testified that he had depleted the leaseholds in the same fashion and at the same rate as in Exhibit 272. (Vol. XCVIII, p. 15245.) It will be noted that the leaseholds are depleted on Statement No. 1 at a 36% rate. Upon request (Vol. C, pp. 14467-15470) Mr. Roberts had caused a computation to be made based upon an elimination of the quantiies of gas sold to industrial customers described as direct sale gas. He stated that the 36% depletion shown in Statement No. 1, Exhibit 272, really should be 36.04% but was rounded out in this exhibit to 36%. The new calculation of leasehold depletion with the direct sale gas eliminated gave 35.62% which was also rounded out to 36% since the estimate is based upon an estimate of reserves and he did not feel it could be brought down to a fraction of a per cent. Mr. Roberts also stated as to the 31% depreciation shown in Exhibit 272 applicable to gas well construction and gas well equipment the absolute accurate figures on this were 31.19% which was rounded out to the nearest per cent, namely, 31%, but that a new calculation based upon the elimination of the direct sale gas shows 30.82% which rounded out to the nearest per cent, still gives the 31%.

Further cross-examination of Mr. Roberts appears under title 27 supra.

Accumulated Depreciation and Its Application to Original Cost of Canadian's Portion of the Denver Line as of December 31, 1938.

The accumulated or actual or observed depreciation existing in this property, as distinguished from the book reserves, was determined by Witness Rhodes in Exhibit 68, pages 35 and 36, abstracted under Title 23. Witness Roberts, whose identity and qualifications have already been stated, in Exhibit 273 adopted and applied such observed depreciation to the original cost as of December 31, 1938, as determined in Exhibit 67, Witness Lusk, abstracted supra. The results are shown in Statement I of Exhibit 273, as follows:

Canadian River Gas Company

Accumulated Depreciation of the Original Cost of the Physical Properties of the Denver Pipe Line as of December 31, 1938

Summary by Accounts

Item No. (1)	Account No. Company (3)	Description (4)	Original Cost (A) (5)	Accumulated Depreciation Per Cent (6)	Accumulated Depreciation Amount (7)
		Transmission System			
1.	218	Compressing Station Land	$ 1,516	.....	.....

23.		Total	$ 406,724		$ 22,493
24.		Total Original Cost	$ 4,012,380		$421,295

Notes: (A) As shown on Exhibit No. 67 adjusted as shown on Statement No. 2 attached.

(B) As shown on Statement No. 3, Exhibit No. 272 relating to Depreciation and Depletion of Original Cost.

Accumulated Depreciation and Its Application to Equivalent Original Cost of Canadian's Portion of a Denver Line for All Gas, Except Colorado Interstate's Direct Sale Gas.

In Exhibit 275 Witness Roberts, following precisely the same method as described in connection with Exhibit 273 supra, applied the observed depreciation as of December 31, 1938, to the equivalent original cost of Canadian's portion of the Denver line, as shown in Exhibit 134, Witness Lusk abstracted supra. The results are shown on Statement 1 attached to Exhibit 275, as follows:

Canadian River Gas Company

Accumulated Depreciation and Its Application to the Equivalent Original Cost of the Physical Properties of "A Denver Pipe Line for Resale Gas Alone" as of December 31, 1938

Summary by Accounts

Item No. (1)	Account No. Company (3)	Description (4)	Original Cost (A) (5)	Accumulated Depreciation Per Cent (6)	Accumulated Depreciation Amount (7)
		Transmission System			
1.	218	Compressing Station Land	$ 1,516	....	.....

18.		Total	$ 3,090,903		$335,245
19.		General Property (Allocated) (B)	170,206		36,080
20.		Total Transmission System	$ 3,261,109		$371,325
		General Construction Costs			
21.		Applicable to Transmission System	378,318	....	.....
22.		Applicable to General Property	11,469	....	.....
23.		Total	$ 389,787		$ 22,192
24.		Total Original Cost	$ 3,650,896		$393,517

Notes: (A) As shown on Exhibit No. 134 adjusted as shown on Statement No. 2 attached.

(B) As shown on Statement No. 3 of Exhibit No. 272 Relative to Depreciation and Depletion of the Original Cost of Producing and Gathering Facilities.

Further cross-examination of MR. ROBERTS appears under title 27 supra.

Provision for Depreciation and Depletion and Corresponding Reserves, as Shown by Company Books.

Under Title 27, "Amortization and Depreciation," supra the evidence is abstracted showing the basis upon which both companies in the beginning dealt with the subject of depreciation. Colorado Interstate began to amortize its cost of contracts on the basis of a 20-year project term and Canadian River began to set up a reserve for depletion for its leaseholds and other depletable costs on the same basis.

WITNESS LUSK testified on direct examination: (Vol. XIX, pp. 2618-2619.)

Q. I notice an item of income taxes in this statement. Will you explain how the company might have income subject to income tax under this character of contract?

A. Well, it all came about with the rulings of The Internal Revenue Department that certain depreciation was not allowable. Therefore, the company was assessed amounts of income taxes from approximately 1931 right down to 1939.

Q. That is to say that there is a difference be ween the amortizations under the contract and the amortizations, broadly speaking, that are allowed by the Bureau of Internal Revenue for income tax purposes?

A. Well, the Bureau of Internal Revenue wouldn't allow amortization of debt to be included in amortization under any other form, under any circumstances.

Q. Did the original contract, Exhibit 16, make any provision for income taxes?

A. No, sir, it specifically exempted all forms of income tax.

Q. When income taxes developed by reason of this difference in amortization, were arrangements then made to include income taxes as a part of the cost of gas?

A. Yes, sir.

Q. And they have been included subsequently?

A. Yes, sir.

MR. LUSK on cross-examination testified: (Vol. XIX, pp. 2640-2644.)

Q. Refering back to your statement with reference to the changes made or recommended by the Internal Revenue Department, what did the Internal Revenue Department have to say with reference to the company's method of setting up depreciation or depletion on its books?

A. Well, the principal objection of the Internal Revenue Department in the early years was the disallowance of the difference between the cost of the leases and the amount that the company had taken as a depletable base.

The Internal Revenue Department also recommended certain changes and they were adopted by the company, adopted in 1931, in which the company accepted depreciation on a 25-year life basis.

Q. And what had the company set up on its books before that time?

A. The company originally started out to depreciate all of its depletable property on a 20-year life basis, five per cent.

Q. And what was the company's reason for setting them up on a 20-year life basis?

A. It was the life of the contract.

Q. That was for the purpose of tieing in with the provision of that contract?

A. That was the original intent, yes, sir.

Q. Then, when the Internal Revenue Department suggested the change did the company set up its depreciation on that basis as recommended by the Internal Revenue Department?

A. They did—unfortunately, they did.

Q. What year was that?

A. About 1931.

Q. 1931?

A. Yes, sir.

Q. Why do you say it was unfortunate that the company had to do it on that basis?

A. I am glad you asked that question, Mr. Lange.

Q. All right.

A. Because that is one—

Q. We want to air the whole thing. Let's get the reason for it.

A. I could never understand why the Canadian River Gas Company accepted the rule of the Internal Revenue Department and attempted to fit those rulings into the corporation accounting. They should be set up following their own practices and thoughts. The Internal Revenue Department is interested in taxes and not in corporation accounting.

Q. Well, but you just said they didn't set that up according to their own plans and thoughts but set it up to be complying with the provision of that contract.

A. No, I didn't.

Q. You say they set it up on a 20-year basis according to the contract?

A. That is correct.

Q. Their opinions or views didn't enter into that after that became fixed?

A. What I am quarreling about is why did they have to accept the Internal Revenue Department's rulings? They could still have gone on a 20-year life basis.

Q. Well, when the Internal Revenue Department made those changes or required those changes to be made, who was in charge of the acounting department of the company at that time?

A. Either—I think it was Mr. Simpson.

Q. Mr. Simpson?

A. Yes, sir.

Q. He is the Mr. Simpson referred to previously in this testimony?

A. Yes, sir.

Q. What was his opinion about it?

A. Why, I imagine that he took the matter up with New York and Amarillo and he was instructed to follow the Internal Revenue Department's ruling.

Commission WITNESS KENNETH L. SMITH testified on cross-examination: (Vol. XLIX, pp. 6792-6797.)

Q. Mr. Smith, I take it that you assume no responsibility for the service life estimates which were furnished by the Bureau of Engineering.

A. As to supporting them, no I do not.

Q. You just accepted them as they gave them to you?

A. I have accepted them and I have no reason to consider them unreasonable to the best of my knowledge.

Q. Well, a matter of determining service life is primarily an eingineering matter rather than an accounting matter.

A. That is true.

Q. It requires knowledge of the type of property through which it is put, the country through which it runs all of those things.

A. Any number of things which, of course, were not a part of my assignment. I merely made that statement to say that I accepted them in good faith and in good confidence as an accountant.

Q. Now, do you have with you or can you furnish us a copy of the service life estimates of various types of property which you used?

A. Service life estimates I think are set forth in my exhibit. Take, for example—turn to Schedule 2 on Page 16 as an example, Line 6, the annual rates are shown—

Q. Well, from that—

A. —that is, the percentages.

Q. That indicates that for main line, the service life is fifty years?

A. That is correct.

Q. Well, what I would like to have is the report and whatever reasons are in the report that support fifty years.

A. Well, in that case I think I will refer that question to counsel.

Mr. Lange: Yes, that will be in a separate tabulation and exhibits supported by the engineer that prepared them. Yes, sir, that will be in detailed form.

By Mr. Dougherty:

Q. I take it that you are applying this at the same rate each year, that is, on a straight line basis, two per cent each year?

A. Yes, that is correct.

Q. What is your definition of depreciation?

A. Well, I have adhered to the definition in the Uniform System of Accounts of the Commission for natural gas companies. It appears on Page 4.

Q. Yes. That is No. 14?

A. No. 14.

Q. Will you read that, please?

A. "Depreciation, as applied to depreciable gas plant, means the loss in service value not restored by current maintenance, incurred in connection with the consumption or prospective retirement of gas plant in the course of service from causes which are known to be in current operation and against which the utility is not protected by insurance. Among the causes to be given consideration are wear and tear, decay, action of the elements, inadequacy, obsolescence, changes in the art, changes in demand and requirements of public authorities, and, in the use of natural gas companies, the exhaustion of natural resources."

Q. Did you or do you know whether in the determination of the service life by the engineering bureau that that last phrase was considered; that is, the exhaustion of natural resources?

A. I so understand that that was given consideration but I do not know the particulars.

Q. Well, the reason I ask that, the word "service life" ordinarily implies the physical life of the particular property and what I was interested in is whether this estimate of service life was made without consideration of the exhaustion of natural resources which move through the line.

A. No, it is my understanding that the Bureau of Engineering did give that consideration but, as I say, they made the determination. I did not and therefore I do not know the particulars except that I know they have given it consideration.

Q. Well, I take it what you have done is really take their percentages or percentages that represent the service life and then applied those retroactively to the various classes of physical property of the company year by year and in that way arrived at the accrued depreciation as of December 31, 1939.

A. I don't know the significance of your word "retroactively," but I did employ those percentages from the beginning or the inception of the company.

Q. The word as I understand it and I used it to mean, applying to a period prior to the date you made your computations.

A. Well, I applied these service life estimates or percentages derived therefrom commencing as of the inception of the company.

Q. And the date when you did make that computation was when?

A. Well, these computations were, of course, made in the summer and fall of 1940.

Q. You probably learned that the rates of depreciation which the company had actually been accruing on its books had been accepted by the Internal Revenue Bureau each year as the Federal income tax settlement was made for such year?

A. Well, I have no knowledge of any pending litigation or discrepancy between the company's accounts as kept by its books and the settlements for income tax purposes. It is my general understanding that they were using a basis for depreciation which was in conformity with requirements of the Bureau of Internal Revenue.

Q. Did you make any investigation of the records of the Bureau of Internal Revenue on this company to obtain what information you could with respect to the question of depreciation?

A. No, I didn't go into detail on it. My study is predicated upon the service life estimates furnished by the Bureau of Engineering and as to what extent they studied that situation I don't know.

Q. That is, if any inquiry were made it probably would have been by them rather than by you?

A. It seems to me that getting to the heart of the thing, it would be related to the service life estimates.

Q. So that your exhibit primarily is a series of computations that change or depend upon the basic data furnished you by the Bureau of Engineering. I am leaving out of that now the question of the base against which you applied: that is, the plant account.

A. Yes. The result of my exhibit here would be dependent as one of the significant factors in the computation upon the service life estimates furnished by the Bureau of Engineering.

* * * * *

Mr. Smith further testified: (Vol. XLIX; p. 6806.)

Q. Well, you are recommending it now, I take it. You are recommending it to the Commission for the purpose of

assisting the Commission in determining how much depreciation should be included in the rate structure?

A. Yes. I am showing here a result which shows what I consider to be the proper provisions chargeable to expense and as a result of that same computation the proper accrued depreciation as of December 31, 1939.

* * * * *

MR. SMITH further testified: (Vol. XLIX, pp. 6821-6830.)

Q. I will ask you at this time whether in connection with your accounting work in the matter of Canadian River Gas Company you have prepared an exhibit entitled "Annual and Accrued Depletion and Depreciation of Gas Plant Accounts and Examiner's Adjustments"?

A. That exhibit is, generally speaking, my work so far as the annual accrued depreciation is concerned and Mr. Luttring's work so far as annual accrued depletion is concerned.

Q. Oh, yes, I intended to ask you whether some other accountant on the Commission's staff also worked with you in the preparation of this exhibit.

A. Yes.

Q. That is Mr. Carl E. Luttring?

A. Yes, sir, that is correct.

Q. And is this exhibit that I am now handing you the one that was prepared by you and Mr. Luttring?

A. That is correct.

Mr. Lange: Will the reporter please identify it?

The Trial Examiner: It will be marked for identification as Exhibit No. 176.

(Exhibit 176, Witnesses Smith and Luttring, marked for identification.)

By Mr. Lange:

Q. Now, Mr. Smith, did you in connection with the preparation of this exhibit also prepare a written statement summarizing the main portions and pieces of the exhibit?

A. Yes, I have.

Q. Will you please read that into the record?

A. "This report sets forth the annual and accrued de-

pletion and depreciation of the gas plant accounts of Canadian River Gas Company for the years 1928 to 1939, inclusive. By account classification, it shows annual accruals for depletion and depreciation, based on estimated recoverable gas reserves and service life estimates furnished by the Bureau of Engineering of the Federal Power Commission. It also shows original cost of property retired, salvage on retirements, and other credits, as adjusted by this and other Examiners.

"A comparison of the reserves for depletion and for depreciation of gas plant in service, per books, with those reserves as adjusted by the Examiner, is as follows:

Components of Reserve for Depletion 1928-1939

	As Adjusted by Examiner (Schedule No. 1 Column 3)	Per Books (Schedule No. 5)	Difference
Provision for Depletion charged to Expense	$ 283,170.98	$1,541,371.16	$1,258,200.18
Reserves Acquired	66,929.97	66,929.97	—
Retirements			
Original Costs Retired	(283,657.37)	(432,038.49)	(148 381.12)
Salvage	259,523.00	44,625.00	(214,898.00)
Adjustments of Prior Years' Depletion through Surplus		(69,721.49)	(69,721.49)
Profit and Loss on Retirements (net)		337,203.92	337,203.92
Applicable to Gas Plant held for future use	(1,423.16)		1,423.16
Balance in the Reserve, December 31,1939	$ 324,543.42	$1,488,370.07	$1,163,826.65

Components of Reserve for Depletion 1928-1939

	As Adjusted by Examiner (Schedule No. 1) Column 4	Per Books (Schedule No. 7)	Difference
Provision for Depreciation			
Charged to Expense	$1,679,038.38	$3,764,067.58	$2,058,029.20
Charged to Plant Account	8,031.60	8,031.60	—
Reserves acquired	113,205.45	116,738.18	3,532.73
Retirements			
Original costs retired	(732,713.88)	(813,054.40)	(80,340.52)
Salvage	369,833.15	249,138.31	(120,696.84)
Adjustments of Prior Years' Depreciation through surplus		(636,598.22)	(636,598.22)
Profit or Loss on Retirements (net)		267,205.42	267,205.42
Applicable to Gas Plant held for future use	(2,339.96)		2,339.96
Balance in the Reserve, December 31, 1939	$1,435,056.74	$2,955,528.47	$1,520,471.73

"The Examiner's adjustments were effected through the medium of reclassification and adjusting entries, which were made by this Examiner and others. Of these entries, those which relate primarily to depletion and depreciation are given in this report, and are designated by the numbers 400 to 413, inclusive.

"Entries Nos. 400 to 406, inclusive, which were made in connection with the adjustment of annual and accrued depletion were prepared by Mr. Carl E. Luttring, and the other seven were prepared by this Examiner.

"Entries of the '100' and '200' Series which affected this study are contained in the reports on this company entitled 'Income Account and Supplemental Data including Examiner's Reclassifications and Adjustments' and 'Gas Plant Account and Examiner's Adjustments,' respectively.

"The entries are principally of two kinds, those that affect only the reserves for depletion and depreciation and serve only to adjust the amounts of the several elements of the reserves, which entries are denoted by the letter 'R' prefixed to the numeral, and those entries that involve not only the reserve for depletion or depreciation but one or more other accounts as well. The chief purpose of all these entries is to adjust the annual provisions for depletion and depreciation expense and, concurrently, to adjust the reserves for depletion and for depreciation so that those reserves will properly reflect the total depletion and the depreciation *ligitimately* accrued on gas plant.

"The company's reserves for depletion and depreciation and the depletion and depreciation expense accounts have been reclassified and adjusted to correct various errors and to conform the annual and accrued depletion and depreciation to the remaining natural gas reserve estimates and to the service life estimates made by the Federal Power Commission's Bureau of Engineering.

"The natural gas reserve estimate and service life estimates on depreciable property, furnished by the Bureau of Engineering, yield results substantially different from those obtained by the company on its books, whose annual accruals were based principally on the policy of amortizing property within twenty-five years from January 1, 1931. The methods and the results of adjusting the reserves are set forth in considerable detail in the adjusting entries, each of which states specifically the reason and basis for each adjustment.

"Briefly, the facts about the adjustment of the reserve for depletion are these: As of August 1, 1939, the volume of the company's remaining gas reserve was estimated by the Bureau of Engineering as being 3,656,158,000 Mcf. at 14.65 lbs. per square inch absolute pressure; the production of gas from the company's wells on its acreage by periods, from June 1, 1928, the date of the company's inception, to December 31, 1939, was translated to the 14.65 lbs. base; the number of Mcf. produced during the eleven year and two months' period, from June 1, 1928, to August 1, 1939, plus the 3,656,158,000 Mcf. was considered the original volume of gas, so determined; the undepleted cost (cost less

reserve) of leases and gas well intangibles was diminished for each annual period by an amount which bore the same ratio to the total undepleted cost as Mcf. of production in each period bore to the estimated volume in Mcf. of gas reserves at the beginning of each period.

"Depreciation was computed for purposes of adjustment, based on the adjusted balances in each depreciable plant account. In a majority of instances the appropriate annual depreciation rate was applied to the adjusted plant account balance at the beginning of the year. If a substantial item of plant was added during the year, six months' depreciation rate was, as a rule, computed on that item in the year acquired. All minor plant additions and retirements were, for the purpose of this study, ignored for the year in which they occurred. They were, of course, taken into account in succeeding years.

"Following the adjusting entries, at Page 19 of the report, appears Schedule No. 1. This tabulation contains the information described in the first paragraph of this text except that it gives this information by major functional groups of plant rather than by accounts. It shows separately the depletable and depreciable plant in service and shows depreciable plant, subdivided into production, transmission, and general and undistributed plant. Schedule No. 1 is supported by Schedules Nos. 2, 3 and 4, and their subschedules, and they give, by plant account, the same kind of information that appears on Schedule No. 1. Schedule No. 2 shows six subclassifications of production plant; and Schedule No. 4, nine subclassifications of general and undistributed plant. Schedule No. 2 is supported by two subschedules which furnish subclassifications of other field facilities and gasoline plant, and Schedule No. 3 by one subschedule which shows main line and laterals in four subclassifications consisting of one main line and three laterals.

"The information given on the first five lines of Schedules Nos. 1 to 4, inclusive, and their subschedules are explainable as follows:

"Line No. 1, original charges per books, represents the cost of the company's initial construction and acquisitions plus subsequent gross additions, exclusive of construction

work in progress and gas plant adjustments. In most instances, therefore, the amounts on Line No. 1 may be arrived at by adding to the December 31, 1939 balance per books all retirements from the inception of the company to December 31, 1939, exclusive of construction work in progress and gas plant adjustments.

"Line No. 2, adjustments, represents the net adjustments to these plant accounts made by the Examiner who prepared the report entitled "Gas Plant Accounts and Examiner's Adjustments.'

"Line No. 3, is the sum of Lines Nos. 1 and 2 and represents the adjusted total cost subject to depletion and depreciation.

"Line No. 4 represents total retirements from the inception of the company to December 31, 1939, as adjusted.

"Line No. 5 is the difference between Lines No. 3 and 4 and represents the adjusted balance in the plant accounts as at December 31, 1939. The amounts on Line No. 5 agree with the adjusted totals shown in Column 7 of Schedule No. 1 of the report entitled 'Gas Plant Accounts and Examiner's Adjustments.'

"The depreciation rates used in the computations which appear in Schedules 1 to 4, inclusive, are based in general on service life estimates furnished to the Commission's Division of Accounts by its Bureau of Engineering. With respect to a gasoline delivery line to Amarillo and a loading rack at that place, which were retired in 1935, their costs adjusted for salvage were written off or depreciated on the basis of the actual periods of service rather than on the basis of estimates.

"The computation of depreciation on garage equipment, which is included in Schedule No. 4, was handled in a slightly but not essentially different manner than other depreciation computations. The total cost of the autos and trucks purchased in any one year was considered as a group cost, and after that group cost had been fully depreciated, which was usually about four years after the year of purchase, no more depreciation was accrued on that group.

"It will be noted that there were no charges to the re-

serve for depreciation for costs of removal. The company consistently charged these costs to expense. We have made no adjustment for them because they could not be determined without an unjustifiable amount of detailed analyses of payrolls, trucking tickets, and other records. *Approximately* 75 per cent of retirements were of such a nature that they involved no removal costs.

"Schedules Nos. 5 and 7 are analyses of the reserves for depletion and depreciation for gas plant in service, per books, for the period begun with the inception of the company in 1928, and ended December 31, 1939, and show the debits and credits to the two reserves classified by years in the manner set forth in the tabulations in this text, above.

"Schedules Nos. 6 and 8 are analyses of the reserves for depletion and depreciation for gas plant in service, as adjusted, for the period beginning with the inception of the company in 1928, and ended December 31, 1939.

"The classifications given in those schedules are the same as the major classifications shown in Schedule No. 1 and show the debits and credits to the reserves classified by years in the manner set forth in the tabulations in this text, above. The minor differences in the amounts as classified in the tabulation in the text, above, and as shown by Schedules Nos. 6 and 8, are caused by a variation in classification of $1,423.16 and $2,339.96, which are set forth in the tabulation above, as 'Applicable to Gas Plant held for Future Use.'

"Schedule No. 9 gives the net retirements of plant costs charged to reserve for depreciation, per books, and as adjusted, and provides a recapitulation of the Examiner's reclassification and adjusting entries affecting net retirements. It shows the amount of net retirements by years and supports Line 22, Column 4 of Schedule No. 1.

"Schedule No. 10 sets forth retirements as adjusted, by years and by accounts; it supports Line 4 of Schedule No. 1.

"Schedule No. 11 sets forth salvage on plant retired as adjusted, by years and by accounts; it supports Line 20 of Schedule No. 1."

* * * * *

MR. SMITH further testified on cross-examination: (Vol. L, pp. 6849-6871.)

Q. Mr. Smith, on Friday you submitted your Exhibit No. 174 which set forth the annual and accrued depreciation of the gas plant accounts of Colorado Interstate Gas Company for the years 1928 to 1939, inclusive.

A. Yes, sir, that is correct.

Q. And at the same time you submitted your Exhibit No. 176 which contains the same information for the same period for Canadian River Gas Company and also accrued depletion with respect to Canadian River Gas Company?

A. Yes, sir.

Q. Now, Mr. Dougherty is about to cross examine you on Exhibit 174, and for the purpose of shortening my cross examination on Exhibit No. 176 which relates to Canadian River Gas Company, I would like to ask you if your answers to his questions relating to the general principles of accounting involved and your accounting methods used would be the same, or will be the same—would be the same with respect to Canadian River Gas Company, and if that is true, and if you will keep that in mind, I do not need to go all over that same field again.

A. I believe that the questions which I answered on Friday afternoon with respect to the principles employed and the engineering support upon which I was relying, the accounting method and the references to the system of accounts of the Federal Power Commission for natural gas companies, I believe that all those answers on Friday would apply equally to Canadian River in so far as the depreciation is concerned.

Q. Yes, I think that is true, also to that part of Canadian River's plant which consists of the transmission line extending from Bivins station to Clayton Junction, your depreciation problem of Canadian River is almost identical with the depreciation problem of Colorado Interstate, is that correct?

A. As far as the accounting principles are concerned. Of course, as to what the engineers found in their study of service lives, I don't know, except that I do know they are adopting similar rates.

Q. Well, suppose you keep that in mind and then when Mr. Dougherty gets through I will ask you a few general questions along that line and we will save time as far as you and I are concerned on Exhibit 176?

Mr. Lange: Right at that point, when Exhibit 176 went on, I did not on Friday afternoon have Mr. Luttring identify his portion of it.

Mr. Spencer: Only as to your portion of it, Mr. Smith.

The Witness: All right. And here is a point, I think:

I don't want to adopt anything I say about Colorado Interstate as applying also to Canadian River until after this cross examination on Colorado Interstate is over. Now, I will consider the adoption at that time if that is all right with you.

Mr. Spencer: That is very satisfactory.

The Witness: As far as my answers from now on are concerned, when Mr. Dougherty is cross examining me, my answers will apply to Colorado Interstate and I will adopt them for Canadian River later on if I can, if that is what you want.

Mr. Spencer: That is very satisfactory. My only point in bringing it up is so that you will have it in mind.

By Mr. Dougherty:

Q. Mr. Smith, did you make some special study of the principles of depreciation accounting as part of the preparation for doing this work in Exhibit 174 and 176?

A. I probably reviewed and intensified my study of the principles of accounting back of depreciation. Naturally I would in order to do a competent job. However, so far as my previous study of the principles of accounting underlying depreciation, that has been going on from time to time over a period of years—a number of years.

Q. There are special principles that apply to depreciation accounting, are there not?

A. I doubt if I would agree with you. I think that the general principles of accounting apply to depreciation the same as any other accounting, whether prepaid insurance or operating expenses or what-not.

Q. In applying those principles, however, it is a fact, isn't it, that many special text books are written on depreciation accounting, particularly to take up the problems that are peculiar to depreciation accounting and the things that you must consider in doing it?

A. There have been several text books written especially on depreciation accounting, that is true, but the underlying principles go right back to fundamental accounting principles.

Q. Well, I would assume that you wouldn't have anything contrary in the depreciation accounting theory that would be contrary to the general principles, but what I am getting at, it is considered as a special problem that must be dealt with specially and a lot of literature has been written on the question of depreciation accounting.

A. There have been special works written on depreciation accounting, that is true.

Q. And isn't it so also that you have to consider many factors in depreciation accounting that you don't have to consider with respect to your income statements, operating expenses, and so forth?

A. Well, I am not sure that I follow that exactly. I think the underlying principle is exactly the same.

Q. Well, you aren't bothered with service lives in operating expenses or income statement accounting, are you?

A. Well, you are involved with something that is very similar in principle when you go to spreading unexpired insurance for example. From an accounting standpoint the principle is practically identical.

Q. Of course, unexpired insurance you definitely know the end date of that.

A. That is the distinguishing feature in the application of the principle, but the principle is the same.

Q. And in service lives, of course, it is not a thing you can fix with mathematical accuracy?

A. Of course, you understand I haven't attempted to fix the service lives. You assume I understand that no one could set them with mathematical accuracy?

Q. That's right.

A. Well, of course, I haven't considered the problems of setting service lives. I think that is the engineering phase of this study, and to what degree the engineer thinks that his method approaches mathematical accuracy, I believe is a question for him to answer.

Q. Now, in depreciation accounting, do you then consider it the duty of an accounting officer of the company in determining what the accounting shall be for depreciation to

accept any information on service lives without any consideration of whether they might be accurate or whether all factors have been considered in arriving at those service lives?

A. I think the accounting officer should satisfy himself that the engineer who prepared the service life estimates is qualified and competent, and if he had any experience, things that he knew of his own knowledge, facts on which to question the engineering estimate, it would probably be his duty to question it, but I do not believe that the accounting officer, unless he happened to be an engineer also, would be qualified nor duty-bound to question it from a technical sense.

Q. I didn't ask you whether he should question it from a technical sense, but what I want to know is, what do you consider the responsibility of an accounting officer in laying down a policy for depreciation accounting with respect to accepting without inquiry what the other officers say with respect to service lives and whether or not you think that such accounting officer would have fulfilled his obligation and responsibilities without making further inquiries as to the method pursued and things that were done.

A. Well, I am not sure but what I have answered your question.

Q. Well, you added the qualifying phrase "technical matters," and there is a lot of practical knowledge brought into use in depreciation accounting, is there not, Mr. Smith?

A. What do you mean by practical knowledge?

Q. Some knowledge of the actual operations of the company, what type of a business it is, what its problems are from an operating standpoint.

A. I don't see that it is essential to the application of the accounting principles, if the engineering factors have been supplied to the accountant.

Q. You think it is purely, then, a theoretical application of accounting principles without the accounting officer himself having any practical knowledge or bringing into play any practical knowledge about the company's business?

A. He doesn't need any practical knowledge as to setting service lives estimates.

Q. I didn't ask you that question. I know you got the service lives from somebody else. I am trying to find out whether you think the accounting officer's work is just that

of a clerk making computations by figures, or whether he must exercise some discretion and have some responsibility about it.

A. He has the responsibility of the matters that are in accounting—

Q. If somebody gives you two per cent times the plant account, that is an easy job. I could do that and the clerk could do that.

A. That is true, but that is not the whole story.

Q. That is what I am trying to find out. What is the whole story? What is it the accounting officer should do in addition to taking the percentage that is given him by the engineer?

A. Well, it is his responsibility to see that after the service life estimates are determined, to see that that is in fact carried out in making the computation side of the entry. Now, as far as accruing depreciation expense and setting up the entries for accruing depreciation expense, applying the percentage is, as you say, somewhat clerical, but there is a lot more to depreciation accounting than merely getting out a calculating machine and applying some percentages.

The depreciable base must be kept in mind and that is the responsibility of an accounting officer and the retirement accounting, the items which are charged against the depreciation reserve in the normal course of business is almost entirely accounting and that is the responsibility of the accounting officer to see that proper charges are made against the reserve from time to time and it is also his responsibility—largely his responsibility, to set up a proper system of control in his accounting organization so that the charges against the reserve for retirement expenses and salvage are properly recorded and so that a proper distinction is drawn between maintenance and depreciation or retirement accounting at all times. Those things are very definitely the responsibility of the accounting officer.

Q. You have left out what you think his responsibility is with respect to the determination of the annual rate of accruals and is the responsibility to the executives of the company for that determination after he has got the service lives, or has he no responsibility for it?

A. Well, that might vary with the expectations of the

officers of the company. I don't know whether I can make a statement about that categorically or not.

Q. I see. It would depend on whether he had assumed responsibility for it, or from an accounting standpoint you have mentioned these other things which the accounting officer is responsible for. You don't think he is to the same extent responsible for the determination for the annual rate which depreciation should be accrued?

A. I don't believe that he is.

Q. Is there any difference in considering depreciation accounting particularly with respect to the annual rate of accrual as between public utility companies and industrial companies?

A. From a strict accounting viewpoint, I can't see that there is.

Q. Well, now, of course, the situation with a utility company is that the annual accrual of depreciation is one of the items that goes into the determination of what the rates to be charged shall be?

A. Speaking now of the annual accrual, now, you mean the depreciation expense account?

Q. That's right.

A. Of course, what goes into computing the rate is a matter that is just outside of the accounting field, I believe. I am not attempting to avoid your question at all, but I will say from the standpoint of accounting principles in order to have the cost of operation for any period that you must include an item of expense for the annual accrual for depreciation.

Q. And in a utility company it is the cost of operation that is determined before the rates are fixed by a regulatory body?

A. Well, I would assume that the regulatory body would want to have that information and would make use of it, but as to how they apply it in making rates, I am not prepared to make a statement.

Q. Now, with an industrial company, their prices are fixed by matters that are determined many times prior to the determination of the depreciation expense, if they have any, isn't that correct? That is, an industrial company or any type of organization or company that does not have its rates subject to regulation fixes its prices without reference

to depreciation expense but it may be in the operating expenses?

A. I am not prepared to say how the prices for industrial concerns are set, but I will say this, that they cannot compute their true cost of operation without including a proper provision for depreciation. That is elementary and fundamental in accounting.

Q. That is true whether they know them in advance or know them after the cost has occurred or before the sale or after the sale is made?

A. Well, it is true as an accounting principle, regardless of anything else, whether they sold a nickel's worth or not.

Q. You are relating this matter of depreciation accounting in your exhibit only to the problem of accounting and without having in mind any bearing that the exhibit might have on the question of fixing rates under investigation by the Commission in this case?

A. I applied the very best accounting principles that I could conceive of and learn about through study and what I have gained from my own experience, so as to come to what I thought not only applied for depreciation but for all of the other elements we put into the income statement, which I supervised the preparation of, so that we have come to what we consider to be as near as it is possible to get the figures for the true cost of gas operations.

Q. You did that just the same as if you had been applying accounting principles to a steel mill or grocery store or any other type of enterprise?

A. The accounting principles are exactly the same whether they are for a steel mill, grocery store, or public utility, or what-not.

Q. And you are not giving any special consideration to the fact that the depreciation expense is one of the important factors in determining reasonableness of rates in a rate case?

A. That hasn't been an integral part of my study as such. The use of my exhibit that might be made in setting rates is something I haven't had a part of and possibly will not have a part in directly

Q. When you as an accounting officer made up your mind about these annual rates of accrual, I suppose you have in mind that if you want to be certain that your reserves will

accrue in the full amount required that there must be an adequate accrual to do that?

A. Will you read the question again, please?

(The question referred to was read by the reporter, as set forth above.)

The Witness: Maybe we can state this another way and shorten it a little bit.

What you mean is that the annual accruals must be of sufficient amount to retire the property at the end of its service life?

Mr. Dougherty: Quite so, yes.

The Witness: Yes, I think that is correct.

By Mr. Dougherty:

Q. If there is any question of doubt as to whether an estimated annual return will accrue depreciation to sufficiently retire the property, is it proper as a matter of conservative accounting practice to lean towards the side of a greater amount of annual accruals rather than a lesser, assuming that you have two figures which you are considering?

A. Well, I don't believe that an accountant has any choice after the service life estimates are figured. After the service life estimates are fixed I can't say that I am going to lop five years off of this and ten years off of that. There wouldn't be any rhyme or reason to that.

Q. Supposing the engineer says that his service life would be between thirty-five and forty years but he couldn't give you any more of an exact figure. What would be your practice?

A. If he said between thirty-five and forty years?

Q. Yes.

A. I would ask him to make up his mind and give me the figures.

Q. Then if there is any question about it he would have to decide whether he would take 35, 36 or 37 years?

A. I think so because I think I would be getting into the field of engineering if I made up his mind for him.

Q. What would you do if you asked two engineers and both of them gave you different answers and both of them were of equal reputation?

A. You are speaking of me now as an accounting officer of a *compny*?

Q. Yes.

A. Of course, I don't think that situation would exist.

Q. You think the fixing of service life is a matter of mathematical calculations, it is as easy as that?

A. I didn't mean that. I mean that I don't know about that because I am not an engineer. Of course, this is a situation I have not dealt with but I just can't conceive of it coming up that two engineers on the staff of a company would come to me with two different answers and want me to use two different bases.

Q. You would just ask one engineer or you would tell them to get together on it?

A. I would want to know all of the facts and circumstances. I don't know. It is a very hard thing to do in answering these hypothetical situations, especially so when it is a little bit more removed from what might happen actually. I would naturally have to come to some result eventually, but I would want to get it from the engineers rather than get into the field of engineering myself and decide their engineering problems for them.

Q. Do you recognize any difference in depreciation accounting as applied to an company which owns a hydroelectric plant or an electric public utility which has an indefinite period of service as a base, and a natural gas company which is dealing in an exhausting asset or resource?

A. The principles are no different. The whole objective is to spread the cost over the service life. Now, as to the factors which enter into the computation of service lives, it looks to me that when the service life is set, naturally those things are taken into consideration in that service life but as far as applying to accounting, I think the application of the accounting principles are exactly the same.

Q. Do you have when you get your service life the element included in there of depreciation which I think is referred to as "functional"?

A. It is my understanding that the engineers have carefully considered and have arrived at conclusions in arriving at functional depreciation. It is not a part of my study.

Q. Well, do you recognize that in a business dealing with an exhausting resource or asset, such as a coal mine

or gold mine or oil well, or natural gas company, that you have a problem of the ending of that operation for reasons other than the mere ending of service life for physical units of property?

A. One in accounting frequently comes into contact with the fact that that probably exists. For example, a coal mining company often pays dividends out of its depletion reserves and I understand that it is legal for it to do that, and you see evidence of those things, but as far as taking those factors into consideration and setting a rate of depreciation that is to be accrued, of course, that is purely an engineering problem.

Q. Assuming that you were the accounting officer for a coal mine and you had the various physical facilities, the tracks, the tipples, and whatever other machinery they use around a coal mine, and the engineer came in and said to you that the service life of that property was fifty years, would you consider it any part of your duty to inquire of him whether or not the economic life of the coal mine would be fifty years, that is, whether the coal mine would last that long?

A. You mean, in other words, if its reserves would be exhausted before that time?

Q. Yes, wouldn't it be a part of the responsibility of the accounting officer to find out whether the reserves would be exhausted before fifty years' time?

A. Of course, he couldn't make that determination up on his own account. You mean he would have to rely upon his expert—

Q. All right, but isn't it part of his duties to make inquiry and consider it, and if not, to have it considered?

A. Of course, as an accounting officer I think his responsibilities would end with the authority and responsibility that had been delegated to him by the management of the company or by the directors in any particular instance.

If the management of the company had instructed the accounting officer to have used the service lives and delegated the responsibility of setting proper service lives forth to the engineers for the coal mining company, I am not so certain but what the accounting officer would have discharged his real responsibility.

Now, if he had any reason to doubt the competency of the

engineers who gave the estimates or felt that it was necessary to inquire into their procedure, I think it would be a responsibility for him to do that because he would want to see some support, some sort of a statement from the engineers as to their methods, but he couldn't pass upon whether that method was technically sound.

Maybe I have gone all around your question and haven't wound up at the exact point you wanted me to, but if this accounting officer had knowledge of the fact and knew it either through reliable information that he had obtained, or otherwise, information upon which he could rely, and he knew the exhaustion of those resources would take place before the service lives set for the physical property, then obviously he would not be using good accounting practice not to go into it further.

Q. My question is this, that the accounting officer is the principal and responsible accounting officer of the company; that he has been told by the president that he can use all of the engineering figures made by the engineers but that he was going to hold you responsible. The next step was that you called in your engineers who gave you a service life. Don't you feel that it is the responsibility of that officer to find out whether the engineers have considered the exhaustion of the coal and what consideration they have given to it even though you don't know a thing about it?

A. Yes, I believe that would certainly be a higher class practice than to ignore or overlook it.

Q. Isn't the first thing an accounting officer would do would be to check with the engineer as to the relationship of his service life to your estimates of the exhaustion of this coal mine? Isn't that one of the first questions you would ask?

A. I think that he would have to recognize that relationship and he ought to be satisfied on that point but he couldn't make the determination.

Q. No, but I say this: Wouldn't he have to say it had been made and given consideration?

A. I believe in order to follow out his responsibility as chief accounting officer on a high plane from a professional and ethical standpoint, he would have to make some investigation that he would have to rely upon in forming his opinion as to the estimate by technical experts in that field.

Q. Now, do you recognize in such a case as a coal mine that by the time that the exhaustions of the coal had taken place there should have been accrued a depreciation reserve sufficient to retire all of the physical property used in connection with that coal mine less salvage?

A. That is correct.

Let me restate it to you to make sure that we are on the right track.

Q. Surely.

A. By the time the exhaustion of the mineral deposit is made there must also be enough money in the depreciation reserve to retire the equipment less salvage, less net salvage?

Q. That is right. That is my problem.

A. Yes, that is exactly right and that is in accordance with sound and accepted accounting practices.

Q. That would be true even if the physical service life of the equipment were a greater number of years than the period of life of the mineral deposits, that is, to put it specifically, let's assume that the physical service life of the equipment was fifty years for each piece of equipment and that the exhaustion of the resources would take place in forty years; you would have to base your depreciation on forty years rather than on fifty years?

A. Yes, that is correct.

Q. Now, in connection with that problem, do you know whether in this case—that is, the current case at hand—the engineers based their 50-year life of transmission line pipe of Colorado Interstate Gas Company on the physical factors or did they give any consideration to the exhaustion of the source of supply of gas which goes through that line?

A. They, as I understand it, did give consideration to the exhaustion of the source of supply of the gas which moves through that line. I don't know the particulars of that but I do know that it was considered and that the source of supply and the availability studies do have detail from an engineering standpoint in such a way there was no flaw in the service lives they adopted.

That is my understanding of the situation, that is, the understanding upon which I have proceeded.

Q. You say there is no flaw in it; is that your own judgment?

A. No, that is my understanding, that there is no flaw in it.

Q. That would apply with respect to that part of the Canadian River Gas Company's property from Bivins north, the same 50-year life as assigned, because you have used two per cent in the exhibit on transmission line?

A. It seems to me that the situation there is entirely comparable to the main line of the Colorado Interstate Gas Company.

Q. Do you know whether or not the fifty years is the life of the field or is the physical life of the pipe, or is it a composite figure that has been arrived at after giving consideration to both the physical and functional factors as involved in this matter?

A. It is my understanding the physical and functional factors have all been given proper consideration from an engineering standpoint.

Q. I assume that the period of exhaustion of the gas reserves would not be less than fifty years, which is the service life used; that is, isn't that a fair assumption to make?

A. I believe from everything I have said here and the evidence that is in my exhibit, you could fairly conclude that.

* * * * *

MR. SMITH further testified on cross-examination and redirect examination as follows: (Vol. L, pp. 6922-6936.)

Take the Bivins camp, for instance. There you have under "Structures" 2.86 per cent. I think that is on Page 23.

A. Column 10.

Q. Excuse me?

A. That is Column 10 you are referring to?

Q. Yes. Do I understand that that is a composite rate or is that a rate that is applicable to the Bivins camp only?

A. The 2.86 per cent representing 35 years is a composite life, as I understand it. There again the engineering staff is I believe the ones that can give you better information on that than I can.

Q. All right, now, you have a rate of 2.86 per cent on structures relating to the Bivins camp, and you have a rate of 4 per cent applicable to equipment. Am I correct in assuming that the equipment is going to wear out before the structures do, is that right, at this Bivins camp?

A. Well, it would seem that a shorter service life would imply that that equipment would wear out earlier than the structures, other factors being equal.

Q. Yes. that is right.

A. But it doesn't necessarily follow—

Q. Well, wait. We are just on these figures here, on your figures using the four per cent of the equipment, that means the equipment has a service life of twenty-five years and using your figures 2.86 per cent for structures that is approximately thirty-five years life for the structures, is that not so?

A. Yes.

Q. Now, what I want to ask you, at the end of twenty-five years when the equipment is worn out, been fully depreciated, do you have in mind in your study that you have made here that the company shall replace the equipment and put in new equipment to carry that along, to replace that that is worn out?

A. Well, of course, all of the equipment won't wear out in exactly tweny-five years and I don't think a composite rate of four per cent or a composite service life of twenty-five years means that—there is some of that equipment that will wear out and may have already worn out. Some of it might be less than twenty-five years and some of it might be more than twenty-five years. Twenty-five years is the composite life. Now, in treating this as a going concern which will operate so long as a supply of gas is available, I think it does follow that there will be placements of equipment which might have a short service life.

Q. Let me put my question another way: Of what use to the company would the structures be for thirty-five years when the equipment that is in it will be gone in twenty-five years?

A. You are assuming now that there will be no equipment replaced?

Q. I don't know. I am trying to find out what you are assuming in making this study. That's all I'm trying to do here.

A. Well, I have stated my assumption in the previous answer.

Q. Perhaps I didn't understand. Will you repeat to me again—

A. Well, we have assumed throughout this study that

the Canadian River Gas Company will be a continuing enterprise so long as a supply of gas is available.

Q. Will you put right in there which, according to your calculations here, will not be less than how many years?

A. I didn't make those calculations.

Q. Well, the calculations that you use. Perhaps you don't understand me. You do assume here in using 50-year life, for instance, for transmission lines that Canadian River Gas Company will have an available gas supply for not less than fifty years, isn't that correct?

A. Yes.

Q. You so testified this morning I understood.

A. Yes, that is a fact, and I have in effect at least testified that the engineering data will provide a sufficient margin over fifty years.

Q. To give you an average even on the fifty?

A. I don't understand that.

Q. I mean an average by this: Some are going to wear out before fifty years and maybe some will last longer than fifty years. You think that fifty years is adequate for the purpose of this study, taking both the shorter life and the longer life into consideration? That is what I understood from your testimony this morning.

A. I am not sure that I understand whether there is a question pending or whether that is a question.

Q. Well, I have forgotten, so we will withdraw it.

Now, turning to your written statement, Mr. Smith, did I understand it you had nothing to do with the depletion work in connection with this exhibit? That was done by Mr. Luttring?

A. Yes, that is correct. Mr. Luttring has prepared the depletion.

Mr. Lange: Mr. Spencer, are you now referring to Exhibit 176?

Mr. Spencer: Yes.

Mr. Lange: Well, as I stated this morning, there is a certain portion of that that was prepared by Mr. Luttring and I was going to have him identify that whenever you reached the point in interrogating on that.

Mr. Spencer: My only point in asking Mr. Smith now

was to avoid asking him questions that Mr. Luttring will testify about; so I will ask you questions only about the depreciation features of this exhibit.

Mr. Lange: We might have the witness indicate at this time, Mr. Spencer, to facilitate it also as to which of the Examiner's entries as well as which of the schedules were prepared by him and which by Mr. Luttring.

Mr. Spencer: Well, his written statement indicates what entries he is responsible for but I guess it does not indicate as to schedules.

Mr. Lange: No, it does not as to schedules. I think that will facilitate it on that.

Mr. Smith, turn to your Exhibit 176, the contents page preceding Page 1, the Examiner's Entries Nos. 400 through 406, as I understand were prepared by Mr. Luttring?

The Witness: That is correct.

Mr. Lange: And Entries Nos. 407 through 413 were prepared by you?

The Witness: That is correct.

Mr. Lange: And in so far as the schedules shown on the table of contents are concerned, which of the schedules were prepared by you?

The Witness: Schedule No. 1 and all of the schedule No. 2 except Column 3. Column 3 relates to depletion; then all the rest of the schedules from 2-A through 11, inclusive, are mine except Schedules 5 and 6 which relate to depletion, and those are Mr. Luttring's.

Mr. Lange: All right, with that information, then, I think that will segregate those.

You may proceed, then, Mr. Spencer.

Mr. Spencer: All right, thank you.

Q. Now, turn to Page 2 of your written statement. You have a schedule there which is entitled "Components of Reserve for Depreciation, 1928-1939," and in your first column you show your figures as adjusted by the Examiner which is Scheduled 1, Column 4; the second column showing per books, Schedule No. 7, and then you show the differ-

ence in the third column. The net result of your work and Mr. Luttring's work here being that the company loses approximately a million and a half depreciation and depletion heretofore accrued on its books, is that correct?

A. This million and a half applies to depreciation.

Q. Oh, that's right. I should have confined that to depreciation only. That's right, but applying it only to depreciation, is my conclusion correct?

A. Your conclusion is that we have reduced the accrued depreciation on the books?

Q. Approximately a million and a half dollars.

A. Yes, as of December 31, 1939.

Q. That's right. That, then, operates as a credit to surplus, is that correct?

A. Yes, we have treated any decrease in the reserve for depreciation as a result of this study as a contra increase in the surplus accounts in our balance sheet exhibit.

Q. Now, have you any idea what the Securities and Exchange Commission would say to a holding company or one of the holding company's operating companies that, subject to the Public Utilities Holding Company Act, which attempted to increase its surplus by rewriting its depreciation account or its depletion account? I have had some experience, so I'm trying to get what you know about it.

A. No, I haven't the slightest idea what the Securities and Exchange Commission would say under any circumstances.

Q. You wouldn't be able to testify about their attitude towards this sort of—I was going to say "manipulation." That probably isn't the right word—they probably would use it—this sort of a program. You have no knowledge of what they would say about it or their accounting rules with reference to it?

A. No, I am not in a position to state what the Securities and Exchange Commission would do—

Q. You do know that Southwestern Development Company is a registered holding company under the Public Utilities Holding Company Act, do you not?

A. Well, I don't know that to be a fact. Anything that I would say would be hearsay. I don't know it to be a fact.

Q. You do know that Canadian River Gas Company is a wholly-owned subsidiary of Southwestern Development Company?

A. Yes, there is evidence to support that in this case, as I understand it.

Q. You could move out and make a definite statement that it is for the purpose of the record—it is a 100-per cent subsidiary of Southwestern Development Company? I think counsel would stipulate that.

A. I understand that it is.

The Trial Examiner: I thought Mr. Smith so stated.

Mr. Dougherty: He said it was in the record.

The Witness: It is my understanding that testimony is in the record to that effect.

Mr. Spencer: Excuse me. I thought you had not answered.

Q. Now, on Page 3 of your written statement down about the tenth line we meet the old friend again: "• • • so that it will properly reflect the depreciation legitimately accrued on Gas Plant." You are not saying, I assume, that what the company has done is illegitimate?

A. I don't believe there is any such intention on my part.

Q. You mean by the word "legitimately" so that it will show depreciation properly in your opinion for the purpose of this particular study?

A. Well, I will go along with you on the word "properly." Now, I wouldn't like to leave the impression that I had adopted a set of accounting principles just for this study or this particular proceeding. I think we have followed good accounting principles all the way through and I think that the revised reserve for depreciation was properly accrued, not only from the standpoint of this particular study but from the standpoint of good accounting.

Q. But you aren't purporting to say that what the company has done is illegitimate?

A. No, I haven't intended to imply that.

Q. In the next paragraph, however, you do mention reclassifications and adjustments to correct various errors. I notice in the Exhibit 174 which relates to Colorado Interstate you specified some things which you thought were in error specifically. Here you do not specify specifically what errors you had in mind. Can you enlighten me on that, please?

A. Well, I think I can point out probably the principal—one of the principal objections. On Page 11, supporting Entry No. 407, I have a summary there that shows what the company's depreciation policy has been.

Q. Yes.

A. Now, they adopted a policy on January 1st, 1931 of amortizing their accounts over a 25-year period effective from that day.

Q. Would it upset your train of thought to ask you why that was done as of that date?

A. Well, of course, it is my understanding that I have gained through information obtained—from what vague information I obtained from the accounting examination, that it related to their income tax problem.

Q. Well, didn't they set their books up at that time exactly in conformity with their agreement on this subject with the Internal Revenue Bureau? And haven't they subsequently maintained their books on exactly that basis?

A. Well, as to your first question I don't know, and as to your second question, they have maintained the books on this basis with one minor exception, I believe, since 1931.

Q. All right, now, excuse me for interrupting you. Go back to the errors that you had in mind, using that phrase on Page 3 of your written statement. I think you were going to tell me why you thought this was in error.

A. As I pointed out this morning, I think that when a change in depreciation policy is made as of a certain date that the adjustments of prior accrued depreciation should be made through an adjustment of surplus as of that date if it is a significant amount, rather than spreading a correction of those errors over a series of years in the future and thereby having the wrong net income for each year of the company's existence. That is what it amounts to from an accounting point of view and from the standpoint of good accounting practice and principles and, of course, that is exactly what the company has done as I interpret the way their books were recorded.

Q. What you said on that subject this morning in connection with Exhibit No. 174 would be generally applicable here, is that correct?

A. Yes, the facts in the two situations might be slightly different, but I believe the principle is exactly the same.

Q. I believe you also brought out on cross examination

by Mr. Dougherty that the Internal Revenue Bureau would have nothing to do with your theory so far as income tax calculations are concerned, is that correct?

A. What I mean is this, If I may restate it, is that whatever expedient the Bureau of Internal Revenue uses in applying the statute under which it operates would have, would not necessarily have any bearing at all on the establishment of good accounting principles.

Q. Do you think the company should keep two sets of books, one for income tax purposes and one for rate making purposes, let us say?

A. Well, of course, you are getting into an assumption there.

Q. I am just trying to find out ultimately how many sets of books this company is going to have to keep to satisfy everybody.

A. Well, are you making the assumption that the company has to keep its set of books to obtain its statutory deductions under the Income Tax Act?

Q. Well, it may not be a complete set of books, but they have to keep certain independent data and records for that purpose which in a sense are duplications of some other set, if we followed your principles here.

A. Well, I know that in earlier years in the 1930s, a great many utility companies did keep an auxiliary set of records in order to support their deductions for income tax purposes. Now, I have been away from public accounting practice since about 1936 and I haven't kept up to date on that particular practice of companies, but I have generally understood that the recent attitude of the Bureau was such that they did not have to do that, that they were entitled to the statutory deductions under the law even though they might not agree exactly with the way they kept their general books.

Now, that is my understanding. It is not any legal conclusion on my part.

Q. All right, Mr. Smith, that is one error that you point out. Let us say an error in your opinion. Did you have any others that you thought of sufficient importance to mention?

A. I think another one of those errors shows up in one of Mr. Luttring's adjustments, probably the recorded ac-

counting on the Ingerton lease and that—on the sale of the Ingerton lease. I think that is one of the things we had in mind in making this statement in the written statement.

Q. Well, maybe I can clear it up this way sufficiently for my purposes: Your inclusion of the clause "to correct various errors" is of no serious importance here in connection with this study at all? You see I am very sensitive.

A. Yes, I have been considering, and that statement probably is a little blunt. There are a couple of things of very minor importance a couple of reclassifications there in entries 409 and 410, too, but they aren't serious.

Q. All right, we'll leave it. As I understand your testimony this morning, this exhibit is intended to be informative to the Commission and anyone else who has occasion to study this record for rate making purposes, is that right?

A. Yes, I believe that is correct.

Q. And you aren't intending by this exhibit to recommend that the company change its books and records for this period to conform to what you have found?

A. No, I don't believe that my introduction of this exhibit carries that implication with it at all.

Mr. Spencer: Well, I didn't get that impression.

That is all.

Redirect Examination.

By Mr. Lange:

Q. Mr. Smith, this morning in connection with your cross examination on Exhibit 174, Colorado Interstate Gas Company, some reference was made by you concerning a figure that you understood the Internal Revenue Bureau had used as to the life of the field or the reserves of Canadian River Gas Company and what is your information about that? What support, if any, did you have for it?

A. Well, the information that I had was just general knowledge, the general understanding of the situation that was disclosed in the accounting examination. I did not see any documents to support that theory and I got the information that the company—

Mr. Spencer: Now, wait a minute, Mr. Smith. If he knows—any figures he knows, he can put in, but if he is

going to put geological figures in here that he knows something about—

Mr. Lange: That is the very thing I want to ask him, whether that was based on any kind of an estimate or whether it was an agreed figure or whether he knows any of the facts about it at all.

The Witness: No, I really don't know what the understanding was, if any, between the Bureau and the company and I don't know any documents on which it was based. So far as I am concerned, it is hearsay that I gained from talking to our Examiners who had been down there and who had questioned—it was a natural question to want to know what the company had based its depreciation accounting policy on and that was the understanding that I gained, that it has to do with income tax purposes, and I don't know what, if anything, there was to back that up on the part of the company.

Exhibit 176, in part, is as follows:

Docket G-124

CANADIAN RIVER GAS COMPANY

EXAMINER'S RECLASSIFYING AND ADJUSTING ENTRIES

RELATING TO ANNUAL AND ACCRUED DEPLETION AND DEPRECIATION.

Particulars	Debit	Credit
No. 405		
Surplus - Operating Revenue		
Deductions - Depletion	$110,241.42	
Reserve for Depletion of Producing Natural Gas Lands		$110,241.42

To provide annual depletion of operated acreage based on undepleted gas reserves estimated by Bureau of Engineering, undepleted cost and annual production in amounts for the years as follows:

Year	Annual Depletion	Retirements	Reserve Acquired	Depletion Reserve
as of 12/31/1927	$	$	$55,338.33	$55,338.33
1928	895.30	173.61		56,060.02
1929	2,865.07			58,925.09
1930	5,760.42			64,685.51
1931	6,225.13			70,910.64
1932	6,864.98			77,775.62
1933	6,926.97			84,702.59
1934	9,346.59			94,049.18
1935	10,908.04	3,127.78		101,829.44

NOTES:

(1) All M.C.F. data above are stated on a pressure base of 14.65 pounds per square inch absolute.

(2) Gas reserves shown in column (2) represent remaining gas reserves to 25 pounds per square inch above atmosphere at beginning of each period. All amounts in column (2) were derived by adding M.C.F. produced to remaining gas reserves of 3,656,158,000 M.C.F., August 1, 1939, per estimate of Bureau of Engineering.

The Respondent adopted as of January 1, 1931, with the minor exceptions disclosed in column (4), an amortization basis of computing annual and accrued depreciation, the period for such amortization being set at 25 years. The company's plan contemplates, in general, that the accrued depreciation (amortization) reserve at the end of 25 years from January 1, 1931 will be equal to the book cost of depreciable plant.

2/ Rate of 33.33 percent was in effect to December 31, 1938; for the year [illegible] rate of 25 percent was in effect.

1/ The delivery line to Amarillo and loading rack at Amarillo, installed in 1928, were retired in 1935. Annual depreciation as computed above from 1928 to 1935 includes an amount equal to the net retirement loss on that property. The rates indicated above apply, in effect, only to the delivery line to Exell and loading rack at Exell.

Commission WITNESS LUTTRING testified as follows: (Vol. L, pp. 6937-6950.)

Direct Examination

By Mr. Lange:

Q. You are the same Carl E. Luttring who has heretofore testified in these proceedings?

A. Yes, sir.

Q. Mr. Luttring, I will ask you whether or not in—strike that.

I will ask you whether you assisted in the preparation of Exhibit 176 that has been identified in this proceeding?

A. I have.

Q. And turning to the contents table of that exhibit, I will ask you whether you prepared the entries numbered 400 through 406, inclusive?

A. I did.

Q. And now which schedules did you prepare in connection with that exhibit?

A. I supplied the figures relating to depletion which were used in Schedule No. 2. I also prepared Schedules Nos. 5 and 6.

Q. Now, as I understand this Exhibit 176, in connection with the preparation of which you devoted your time, and on completion of the exhibit it was approved by Charles W. Smith, Chief, Bureau of Accounts, Finance and Rates of the Federal Power Comission?

A. That is correct.

Q. And bears such approval on its title page?

A. That is correct.

Q. And you heard the written statement in connection with that exhibit that was read by Mr. Smith on direct examination?

A. I did.

Q. And in so far as it refers to those entries and schedules that you prepared, that may also be taken as your written statement of that portion of the exhibit?

A. It can.

Mr. Lange: I believe that is all at this time.

Cross Examination

By Mr. Spencer:

Q. These schedules of yours, Mr. Luttring, Schedules 5 and 6 on Pages 26 and 27 of Exhibit 176, summarize your work in connection with this exhibit, Schedule No. 5 showing—

A. Schedule No. 5 on Page 26 and Schedule No. 6 on Page 27 represent my work.

Q. Well, can't we get a good picture of what you have done by reference to those tables?

A. These schedules combined with the journal entries will give you a complete picture of what the books were before we adjusted them in our exhibit and what the results are after applying our adjustments.

Q. All right, now, let's get some idea about the depletable base that we are talking about here. I assume that you start off with depletion accrued on—by deducting the depletion accrued on the books of the Amarillo Oil Company at the time it sold its gas properties and rights to Canadian River Gas Company?

A. The depletion accrued that was acquired from Amarillo Oil Company has remained intact. In other words, the figure was not disturbed and it forms a part of the accrued depletion as of December 31, 1939.

Q. You did not disturb that?

A. No, sir.

Q. Now, the depletable base here includes your adjusted cost of leaseholds, is that right?

A. That is correct.

Q. Adjusted in your original cost study exhibit 146?

A. Exhibit 146 is correct.

Q. You carried that original cost over here as related to leaseholds for the purpose of depletion, is that right?

A. That is correct.

Q. Which is somewhat less than the company is depleting on its books?

A. I think it was considerably less.

Q. Now, in addition to your adjusted original cost for leaseholds you also include in the depletable base the company's original costs of intangibles, I mean particularly intangibles in connection with the drilling of wells, is that correct?

A. Yes, what is known as gas well intangible costs.

Q. And those consist generally of what?

A. Drilling, labor, teaming and freight and incidentals which are not in the nature of depreciable items.

Q. That's right. The physical property in the wells such as the pipe or casings and well fittings are subject to depreciation and not depletion, is that correct?

A. That is right, and it has been so treated in our depreciation exhibit.

Q. What is the depletable base you find here as of December 31, 1939, representing leasehold cost and intangible well costs as adjusted by you?

A. On Schedule No. 1, Line No. 5—

Q. That page is 20—

A. 19.

Q. Yes.

A. Column No. 3.

Q. Yes.

A. That is the total depletable plant. The adjusted book cost as of December 31, 1939 of total depletable plant can be found in Exhibit 146 if you wish to refer back to it.

Q. No, I think that's all right. What was your original cost of gas leaseholds and gas rights and wells acquired by Canadian River from Amarillo Oil Company? Do you remember what that was?

A. The operated leasehold costs amounted to $835,271.68 and the inoperated leasehold costs amounted to $158,228.70. That will be shown on Schedule No. 2 in Exhibit 146.

Q. Yes, but you had some wells to add to that, too, on which you put inventory value as I remember. I am trying to arrive at the total original cost of the properties sold by Amarillo Oil Company to Canadian River Gas Company as you show it.

A. I am just wondering whether I won't have to refer back to my working papers.

Q. Can you give me the rough figures? Is a million and a half approximately correct?

A. That is approximately correct, yes.

Q. Well, that's sufficient for my purpose here. Now, I believe you also testified here that there is no question but what Canadian River paid five million dollars for these properties?

A. That is correct.

Q. Now, what I wanted to ask you, as an accountant how would you recommend that the company go about amortizing this three and a half million dollars that you are throwing out?

A. Well, knowing what I do about the company, I would hesitate to do anything with the three and a half million dollars.

Q. Do you mean you would just leave it in a state of suspended animation or something?

A. If I had to set it up I would probably set it up as I have in here, set it up as a separate item.

Q. It has got to be written off in some fashion, hasn't it, at some time?

A. Well, it probably would be a good thing to get it off the books.

Q. I wish you would consider that. I may have some more questions to ask you on that.

Now, I would like to go to your basis of computing depletion during this period. The explanation given in the written statement starts at the bottom of Page 3. I would like to follow through with you on that. Have you found that?

A. Yes.

Q. It states: "As of August 1st, 1939, the volume of the company's remaining gas reserve was estimated by the Bureau of Engineering as being 3,656,158,000 thousand cubic feet, at 14.65 pounds per square inch absolute pressure."

That figure was furnished to you by the Bureau of Engineering of the Federal Power Commission?

A. It was.

Q. Did you ask for it?

A. No, I did not.

Q. Well, you didn't give the Engineering Department instructions about doing this engineering work for you in connection with this study, then?

A. No, sir.

Q. Who did give instructions?

A. As far as I know, the Engineering Department.

Q. Did you get your instructions from the Engineering Department?

A. No. I say, the Engineering Department gave instructions to get these gas reserves.

Q. Well, where did you get your instructions from?

A. Well, I didn't really need any instructions after I was supplied with this gas reserve figure shown in our statement—the written statement. It was a matter of using it in application in determining the new annual depletion amounts.

Q. Well, isn't this a fact, that you were instructed to work on and prepare these depletion schedules here and in that connection you needed the reserve figure and it was handed to you by the Engineering Bureau of the Federal Power Commission and you accepted it, isn't that correct?

A. That is correct.

Q. You didn't stop to think whether it was the right figure or the wrong figure, you took it, didn't you?

A. I would have no way of knowing. Of course, that particular work is not in my line.

Q. Did you ever set up a depletion schedule for gas companies before?

A. I don't believe I did.

Q. You had no previous experience in preparing a depletion schedule of this character for a natural gas company?

A. I have had some experience but it was something that had already been set up.

Q. I mean in reconstructing or originating depletion schedules for a natural gas company, you haven't done that?

A. Not in this same type of work.

Q. Are there different methods utilized by natural gas companies in setting up depletion schedules?

A. I don't know of any other than the one that is used here.

Q. This is the only one you know about?

A. That's right.

Q. All right, are you familiar with the company's now using it—of computing this depletion?

A. Yes, sir.

Q. That is a different one, isn't it?

A. Well, it is very much on the same order as this one.

Q. Oh, they seem to be the same to you?

A. Very much so.

Q. Very similar—what is the company's method of computing depletion?

A. The company, instead of using a reserve applicable

to its own acreage, used a gas reserve which is applicable to the entire Amarillo gas field and in determining its annual depletion it used the production of the entire Amarillo gas field.

Q. That is correct, and from that they arrive at the unit cost depletion factor to apply to their own production is that right?

A. That is correct.

Q. Now, in other words, the company in computing its depletion costs has based it upon the life of the field, that is correct, is it not?

A. Under the company's method—

Q. Yes.

A. Yes.

Q. Now, state for the Examiner in the same way what the method has been employed by the Commission's engineers and by you in computing the depletion.

A. Well, under this method the engineers have given us a gas reserve estimate which applies to the actual acreage owned by Canadian River Gas Company. The production we used is the production which was actually taken from this same acreage.

Q. By whom?

A. By Canadian River Gas Company. The unit cost of depletion is determined by dividing the undepleted cost of the investment in the leases by the unrecovered gas reserves in those leases. The unit cost so obtained is then applied to the production which the company has taken from those leases.

Q. Have you finished?

A. Yes.

Q. All right, then, arriving at the unit cost of depletion for the purpose of your study here, you have taken into consideration no withdrawals from Canadian River Gas Company reserves as computed except its own production, is that correct?

A. That is correct.

Q. Now, did you ask your Engineering Department before you started computing these schedules to furnish you with a figure of withdrawals that might be sustained by the company through drainage to show how much the property had been actually depleted?

A. By "drainage," do you mean drainage by other operators?

Q. Certainly, certainly, that and any other kind of drainage.

A. That is not an accounting problem as far as I can see it.

Q. Well, did you ask them for that?

A. No, sir.

Q. Were you concerned about it?

A. I was not.

Q. Then, so far as you were concerned, the only figure that you needed was the withdrawals as shown by Canadian River production—nothing more?

A. That is correct.

Q. Had your engineers told you that the property was going to sustain withdrawals through drainage, it would have changed your figures, wouldn't it?

A. I don't think so because you have got both sides of the question there. You have got drainage in as well as out.

Q. No, I said to you, if your engineers had told you that the property was going to sustain a loss of gas reserves through drainage, let us assume—you can assume that for the purpose of this question—it would have changed your figures, would it not?

A. It may have changed the geologist's figures if he had to give some weight to that.

Q. No, I am talking only about production withdrawals. Let the other figure stand. Depletion is suffered by production by a loss of gas from the property, whether it comes through our own wells or somebody else's wells.

A. It would not change my figures.

Q. No matter what drainage we might suffer, it wouldn't change your figures?

A. No, sir.

Q. You would stay right with your guns?

A. Yes, sir.

Q. Now, I believe you stated that the reserve figure that you use here is treating all of Canadian River Gas Company's leases as one *reservoir*?

A. That is correct.

Q. Now, from the standpoint of accounting, then, you are treating the whole reserve as one reservoir?

A. That is correct.

Q. You do recognize, then, that as between leases in the total reservoir the gas moves all around, back and forth, is that correct?

Mr. Lange: Well, I think—

Mr. Spencer: Now, wait a minute—go ahead.

Mr. Lange: Between leases the gas travels back and forth; that is purely an engineering problem.

Mr. Spencer: I'll come to it in just a minute.

The Trial Examiner: Did you question—your question is whether or not he recognized that?

Mr. Spencer: Yes, sir.

The Trial Examiner: He may answer that.

The Witness: I think we have.

Mr. Spencer: I think you have, too.

Q. If you weren't going to treat it as a whole and assumed it was going to be produced as a whole, you would set up each leasehold separately and give its own gas reserve, wouldn't you?

A. That is correct.

Q. You recognize this drainage between leases—you treat this entire block of acreage as one reservoir, but when you get over to a different title you ignore that and say there isn't any drainage. Did you give that any thought?

A. I did not give any thought to it in this study here.

Q. You are including unoperated leases in here for depletion purposes, aren't you?

A. That is correct.

Q. Leases with no wells on them, is that right?

A. That is correct.

* * * * *

MR. BUTTRING further testified: (Vol. L, pp. 6952-6956.)

Q. All right, now, the last one that you had to do with, Entry 406 on Page 8?

A. Entry No. 406 on Page 8 sets up annual depletion according to our computation of gas well intangible costs based on undepleted gas reserves estimated by the Bureau

of Engineering and undepleted cost and annual production in amounts for the years as set forth in the body of that journal entry.

Q. You can go back on Page 7 of the chart there, it is included there, too?

A. Yes, in support of Journal Entry No. 406, are statistics which support also Entry No. 405.

Q. And 406?

A. I said also.

Q. You said also 405, did you not?

A. All right, make it "and 406."

Q. All right, I believe that clears that up as to what you have done.

With your permission and counsel's permission we have a photostatic copy of one of our working papers relating to intangible well costs and on that sheet under the column headed "Balance December 31, 1939" there is a figure of $162,391.84 appearing opposite the description "Miscellaneous." Will you tell me what that is, please?

A. On the gas well investment records of Canadian River Gas Company they carry a column headed "Miscellaneous." In this column is entered items which cannot fall under the description of labor, teaming and freight, drilling, torpedoes, depreciation and adjustment, rigs. It is a sort of a dumping ground for items which cannot be classified into the features just stated.

Many of the items in this miscellaneous column cannot be identified without a great deal of analysis work and for that reason we have used the entire charges in the miscellaneous account as a part of our depletable base of intangible well costs. Our Bureau of Engineering felt that it was advisable to do this rather than spend a great deal of time to try to identify such depreciable items as may be in that account. I think that about covers it.

Q. That is sufficient, Mr. Luttring.

Now, the company on its books and records carries this miscellaneous well cost as a depreciable item, does it not?

A. That is correct.

Q. And if that classification were correct, or assuming it were correct, under your study here the company would

be entitled to take depreciation against the item in the amount of 2.56 per cent per year, is that right?

A. Yes, whatever rate of depreciation applies against gas well equipment.

Q. Well, I am taking the gas well tangible cost rate as shown on Page 20 of your exhibit. Now, you have taken that out of the classification of depreciable property and put it over into depletable property, that is correct, isn't it?

A. That is correct.

Q. Where based upon past experience, at least, and based upon your computations, it would draw a much lower rate of depletion than it would have of depreciation, is that not correct?

A. Well, just how much lower depletion on that would be over the other, I am not prepared to say, but I do think it will be lower.

Q. Well, that is a matter of calculation?

A. Yes, that is what it is.

Q. Now to clear that up, then, you can't tell from the company's books exactly what items of property go into these miscellaneous—this miscellaneous account?

A. That is correct.

Q. That would involve a lot of work which you did not do?

A. Not only that, but I think that even if you do it you will still find that a lot of those items will be intangible items even after analysis.

Q. Well, that may be true; we do not know that it is true right at the moment, though?

A. No, that is correct.

Mr. Spencer: I think that is all.

The Trial Examiner: Do you have some redirect, Mr. Lange?

Mr. Lange: Just this:

Redirect Examination

By Mr. Lange:

Q. You were interrogated with reference to the recoverable gas reserves of the Canadian River Gas Company. What is your understanding of the use of that term as employed?

A. My understanding of the use of the word "recoverable" is that it represents the gas which will be ultimately recovered from the leases owned by Canadian River Gas Company.

Mr. Lange: That is all.

The Trial Examiner: Is that all? Do you have anything further?

Mr. Spencer: Let me see.

Recross Examination

By Mr. Spencer:

Q. Then your computations are based upon the theory that Canadian River will recover all of the gas that is shown here as constituting its reserve?

A. That is my understanding.

Q. To-wit: three trillion plus cubic feet?

A. That is my understanding.

Q. Down to twenty-five pounds? I guess they have that qualification. That is some place here, is that correct?

A. That is correct.

Q. And if anything went wrong with that assumption at any point, then your computations would be incorrect to that extent?

A. That is correct.

Through the WITNESS HILL the Commission presented Exhibit 178, in which exhibit the service lives of the physical properties of Canadian are set forth. This exhibit is similar to Exhibit 177 which was also presented by this witness in connection with Colorado Interstate. The service lives for the main transmission lines and for the structures in Bivins Compressor Station are estimated at 50 years. Other structures and equipment range from 20 to 48 years; gas well equipment, 39; field lines, 40 years; other field line facilities from 23 to 30 years; and general garage and general office equipment, 4 years and 12½ years, respectively.

Exhibit 178 is, in part, as follows:

Statement of Composite Service Lives Determined for Property of Canadian River Gas Company

Account Number and Name		Adjusted Book Cost 12-31-39	Service Life (Years)	Annual Straight Line Rate—%

Commission WITNESS HILL testified on direct examination: (Vol. L, pp. 6980-7000.)

Q. Mr. Hill, did you also in connection with this assignment prepare another exhibit entitled "Determination of Composite Service Lives for Canadian River Gas Company Property"?

A. I did.

Q. Is this the exhibit which I now show you the one which you prepared?

A. It is, yes, sir.

Mr. Lange: May the stenographer please identify it?

The Trial Examiner: It will be marked for identification as Exhibit No. 178.

(Exhibit 178, Witness Hill, marked for identification.)

By Mr. Lange:

Q. Mr. Hill, will you turn t Page 1 of the exhibit?

A. Yes, sir.

Q. Where there is a written statement prepared by you. Will you read that statement, Mr. Hill?

A. "This exhibit was prepared by me and under my direct supervision, and shows composite service lives, by accounts, applicable to the operative gas plant property of Canadian River Gas Company as of December 31, 1939. The annual straight-line depreciation rates shown in this exhibit have been determined from the composite service lives shown therein.

"In August and September 1939 an inspection of the physical plant of the company was made by Federal Power Commission engineers. Production, gathering, compressing, gasoline extraction, and transmission system property was inspected. The location, type of construction, operating conditions, degree of maintenance, exposure to weather, and other factors causing deterioration, and the extent to accrued physical depreciation and of accrued obsolescence were noted for all property inspected. The age of most of the units of property was determined from dates of installation as recorded on the books of the company. Operating and maintenance methods were observed, and operating experience was discussed with company officials and supervisory employes.

"Service lives and composite service lives have been based primarily on the physical lives of the various units of property; however, consideration was given to other causes of property retirement whenever such factors were determinative.

"Company records, from the inception of operation, were analyzed to determine the causes of all major property retirements. These included physical deterioration, caused by wear, tear, rot, rust, decay and the action of the elements; inadequacy, obsolescence; requirements of public authorities; and other causes.

"Probable future conditions of operation compared with past service conditions were considered. The probable life of the natural gas reserves and other factors which have a bearing on the probable service life of the property in each account were taken into consideration. The system was considered a continuing enterprise which will operate so long as a supply of natural gas is available. The net salvage value of the physical plant of the company at retirement is considered negligible, and no salvage value has been assigned.

"In this exhibit 'adjusted book cost' represents the legitimate original cost of gas plant as shown in reports presented in this proceeding by accounting examiners of the Federal Power Commission. 'Service Life,' as used in connection with this exhibit, means the period during which a particular unit of property is used or performs a useful function in the rendering of service. 'Composite service life' means the weighted average service life of all units of property within a primary account classification, determined by dividing the total capital in each primary account by the sum of the annuities applicable to the individual units.

"The general plan of presentation and methods that have been followed in this exhibit are as follows:

"Leaseholds (Account 205). The life of property in this account has not been determined by me and is not shown in this exhibit.

"Gas Well Construction (Account 211). The life of property in this account has not been determined by me and is not shown in this exhibit.

"Gas Well Equipment (Account 212). A composite service life of 39 years has been determined for gas well equipment. A 40-year life is deemed applicable to all wells completed by Canadian River Gas Company and affiliate predecessor owners; the adjusted book costs of such wells are their original costs. 17 wells were acquired from other companies, presumably as depreciated cost. The life applied to each of these 17 wells is 40 years, less the expired life, to the nearest whole year, at time of acquisition by Canadian River Gas Company.

"In determining service lives for gas well equipment 10 inspections of the above-ground property were made at locations picked at random throughout the field. No inspections on well casing were made as the company has had very little casing retirements.

"Factors taken into consideration in determining the service life of gas well equipment included the following:

"1. The company's experience with deterioration of well casing.

"2. Inspection of field lines.

"3. Estimates prepared by Federal Power Commission geologists as to the volume of natural gas which may be produced from the present property of the company.

"It was found that the company has had to replace well casing on some of its older wells because of casing deterioration due to various causes, but has not experienced any serious trouble to date. Our studies indicated that a reasonable physical life for the company's field lines is 50 years; in my judgment, it is reasonable to expect well casing to deteriorate at the same rate, or possibly at a more rapid rate, than the field lines which are laid in the same area. A 40-year life has been adopted as reasonable, due to the fact that well casing is subject to some hazards to which field lines are not exposed. Estimates prepared by Federal Power Commission geologists concerning the volume of gas which may be recovered from the present property of the company indicated that the gas reserves would last longer than the 40-year life adopted for gas well equipment.

"Drilling and Cleaning Equipment (Account 216). Inspections were made of some of this equipment, but informa-

tion was not compiled to determine a life. Investigation by Federal Power Commission accounting examiners revealed that depreciation of this equipment is charged directly to fixed capital and operating expense accounts. It also revealed that the balance of the equipment in this account, as of December 31, 1939, has been 88.44 per cent depreciated. Therefore, it was not considered practical nor necessary to revise the company's depreciation rate for this equipment.

"Field Lines. The property carried under this heading includes Field Line Rights of way (Account 206-B), Field Line Construction (Account 213-B), and Field Line Equipment (Account 214-B). Account 213-B includes costs incident to construction of the field lines, including labor, teaming, supervision and engineering, overheads, and other expenses. Account 214-B includes cost of pipe, couplings, fittings, valves, and other accessory equipment.

"A total of 147 inspections was made on the various field lines, each inspection representing, on the average, approximately $8,500 of investment. These inspection locations were selected by the company, with the exception of a few additional locations which were requested by engineers for the Commission. Inspections were made in August and September 1939.

"At each location selected for inspection, a section of pipe approximately 40 inches long was cleaned. The procedure followed by the Commission's engineers at each inspection was to divide a 36-inch section of clean pipe into three 12-inch sections and take 10 or more pit measurements on each section. These pit depths and the general condition of the pipe were recorded.

"In addition, if the pipe was coated, the kind and condition of coating in the adjacent uncleaned sections of the pipe were recorded; notes were also made regarding type of soil, soil hydration, drainage, the description of adjacent property. The pipe inspection data, together with calculations relating to them, an analysis of the major retirements as shown on the company's records, and other pertinent information were used as guides in arriving at a service life for field lines.

"Based on analysis of data obtained during pipe inspections and analysis of retirements since inception, a 50-year

service life is considered reasonable for the main trunk line, F-1, the investment in which is nearly half of the total investment in field lines. The same life appears to be reasonable for the gathering lines, as a group, but the company's past experience indicates that a number of the gathering lines have been relocated and that there have been substitutions of larger diameter lines for smaller diameter lines.

"It seems likely that these relocations and substitutions will continue in the future as field pressure declines. Due to these facts, a service life of 35 years is considered reasonable for the gathering lines. Using 50 years for the main trunk line, F-1, and 35 years for the remaining lines, gives a composite service life for field line equipment (Account 214-B) of 40 years.

"The same service life has been assigned to field line rights of way (Account 206-B) and field line construction (Account 213-B). Because the average life of the wells is assumed to be at least as long or longer than that of the field lines, field line construction cost has been given the same life as determined for field line equipment. Owing to the fact that field lines may not be replaced in exactly the same location, rights of way also have been assumed to have the same life as field line equipment.

"Other Field Facilities. The property carried under this heading includes field measuring station structures (Account 209-M), field measuring station equipment (Account 215-M), field compressing station structures (Account 221-B), and field compressing station equipment (Account 224-B).

"A number of detailed inspections of field measuring station structures and equipment were made. The stations inspected were picked at random throughout the field. It was found from inspection and from an examination of company records that all but one of the field measuring stations were similar, being constructed of corrugated iron on wood frame.

"The Chicago measuring station is constructed of brick. A composite service life of 23 years has been determined as applicable to Account 209-M and to Account 215-M.

"The company owns and operates one field compressing

station; this is called Field Compressing Station No. 1. The principal items of property and plant, constituting the field compressing station accounts—Structures (Account 221-B) and Equipment (Account 224-B)—as shown on the company's records, were checked and identified in the field.

"Type of construction, condition of the property, and the degree of care used in maintaining the property were observed. Three inspections were made of the underground piping at this station to determine its condition. The station is operated only a few days each month, and this fact was taken into consideration in establishing service lives. A composite service life of 30 years has been determined for structures, and a composite service life of 25 years for equipment.

"Gasoline Investment. The property carried under this heading includes Rights of way (Account 902), Gasoline Plant Structures (Account 903), Gasoline Plant Equipment (Account 904), Gasoline Delivery Line (Account 905), and Gasoline Loading Rack (Account 906).

"The principal items of property and plant as shown on the company's records were identified and inspected in the field. The service lives adopted for major equipment are based on information obtained from these inspections from analysis of company records and from manufacturers of such equipment, with consideration given to the continued technological improvements in gasoline extraction.

"A service life of 50 years has been assigned to rights of way (Account 902), 40 years having been determined as reasonable for gasoline plant structures (Account 903), 28 years for the gasoline plant equipment (Account 904), 30 years for the gasoline delivery line (Account 905), and 28 years for the gasoline loading rack (Account 906).

"Bivins Compressing Station. The property carried under this heading consists of land (Account 218), which is non-depreciable, compressing station structures (Account 221-C), and compressing station equipment (Account 224-C).

"The principal items of property and plant constituting the Bivins compressing station as shown on the company's records were checked and identified in the field. Type of construction, condition of the property, and the degree of care used in maintaining the property were observed.

"Investigation revealed that very little difficulty has been encountered with this equipment. An analysis made of engine-hours operated since installation indicates that the main compressors were operated very little during the period 1929 to 1935, inclusive, but that they have been operated regularly for the past four years.

"All of the above facts, as well as the probability of retirement due to obsolescence and to depletion of gas in the field, were taken into consideration in establishing service lives for this property. A composite service life of 50 years has been determined for compressing station structures (Account 221-C), and 35 years for compressing station equipment. (Account 224-C).

"Bivins Camp Investment. The property carried under this heading consists of land (Account 218), which is non-depreciable, other structures (Account 223-BC), and other equipment (Account 227-BC). This camp is at the same location as the Bivins Compressing Station and gasoline plant, and is used to house the personnel of both plants. The camp consists of one 16-room frame hotel, 32 frame dwellings, one frame recreation hall, four frame garages, one frame paint house, and one frame fire house.

"The same type of construction has been used for the entire camp, and it is apparent that all structures are kept in a good state of repair. The other equipment carried under this heading consists of water distribution system, electric distribution system, gas distribution system, sewer system, and miscellaneous other equipment, such as an ice plant and hotel furnishings and equipment. A composite service life of 35 years was determined for other structures (Account 223-BC), and 25 years for other equipment (Account 227-BC).

"Transmission system. This heading consists of transmission system land (Account 218-D), transmission line rights of way (Account 220-D), and transmission line equipment (Account 226-D). Transmission system land is considered non-depreciable, and rights of way have been given a service life of 50 years. A total of 120 pipe inspections was made on the main 22-inch transmission line running from the Bivins compressing station to Clayton Junction, New Mexico, and six inspections were made on the various

lateral lines, or, on the average, one inspection for approximately each $20,000 of investment. The inspection procedure described under 'field lines' was also followed in connection with transmission lines.

"Studies indicate that 50 years is a reasonable service life for pipe and equipment in the main transmission line, and 40 years for the lateral lines as a group. A service life of 30 years is considered reasonable for general emergency equipment. The aggregate book cost of the equipment with service lives of 30 and 40 years is less than 1½ per cent of the account total. A composite service life of 50 years has been determined for transmission line equipment (Account 226-D).

"Dehydration Plant. Property carried under this heading consists of land (Account 218-D), which is considered non-depreciable, structures (Account 223-D), and equipment (Account 227-D). This plant is located on the main transmission line near Hartley, Texas.

"The principal items of property and plant constituting the dehydration plant as shown on the company's records were checked and identified in the field. The type of construction, condition of the property, and the degree of care used in maintaining the property were observed. In addition to this inspection of the physical property at the plant, inquiries were made of responsible parties as to the probable service life of this type of equipment. A composite service life of 35 years was determined as reasonable for structures (Account 223-D), and 25 years for equipment (Account 227-D).

"Transmission System Measuring Stations. The property carried under this heading consists of measuring station land (Account 218-M), which is considered non-depreciable, measuring station structures (Account 222-M), and measuring station equipment (Account 225-M).

"These accounts include a main line measuring station, which measures gas delivered into the Denver line, and several smaller stations located on the various lateral lines. The principal items of property and plant constituting the above accounts as shown on the company's records were inspected and identified in the field.

"The type of construction, condition of the property, and

the degree of care used in maintaining the property were observed. All but one of these stations are similar, being constructed of corrugated iron on wood frame. The main line measuring station, located at Bivins station, is built of brick. A composite service life of 40 years has been determined for measuring station structures (Account 222-M), and 28 years for measuring station equipment (Account 225-M).

"General Property. The property carried under this heading is comprised of:

"1. General Office Structures (Account 247-E) consisting of one frame office building located at the Bivins compressing station. The same type of construction as used in the Bivins camp was also used in this building, and it is equally well maintained. A service life of 35 years is likewise applicable to this account.

"2. Other General Structures (Account 248-E) consisting of Masterson G-2 camp and Fritch maintenance camp, Bivins Warehouse, Bivins garage and welding shop. All these structures were inspected, and it was found that the majority of this property has been kept in a good state of repair. A composite service life of 35 years is determined as reasonable for this account.

"3. General Office Equipment (Account 249-E) consists of furniture, office machines, and similar property. After giving consideration to the kind of property, its use, and to the company's past experience, 12½ years was determined as a reasonable composite service life of equipment in this account.

"4. General Stores Equipment (Account 250-E) consisting of shelving and bins in the Bivins warehouse, pipe and casing racks, and miscellaneous equipment used for handling and storing material. A composite service life of 35 years has been determined as reasonable for this account.

"5. Telephone System (Account 255-E) consisting of telephone rights of way and telephone equipment. Telephone rights of way have been given a service life of 50 years. Telephone equipment consists of copper, copperweld, and iron wire, together with poles, brackets, crossarms, pins, insulators, guys, and miscellaneous hardware.

"The telephone system consists of lines from Bivins compressing station to Amarillo, Bivins station to Red River Gas Company at Fritch, Texas, and from Bivins station to Clayton Junction. One pole in each mile of line was carefully inspected for checks, condition of butt, and condition of treatment.

"A general inspection of the condition and type of construction of the entire line was also noted. Based on the information obtained from this inspection and the company's past experience, a composite service life of 30 years was adopted for telephone equipment.

"6. General Tools and Implements (Account 256-E) consists of miscellaneous tools, construction, and maintenance equipment. The physical life of much of this equipment is affected by deterioration with time as well as with use. A composite service life of 15 years is considered reasonable for this account.

"7. Other General Equipment (Account 257-E) consists of miscellaneous materials and equipment of many descriptions, but, since the majority of the investment represents materials and equipment with a physical life of 20 years or more, 20 years has been adopted as a reasonable composite service life for the entire account.

"8. General Garage Equipment (Account 252-E) consists of passenger cars, pickups, trucks of various capacities, trailers, tractors, and excavators. Some of this property is more in the nature of work equipment than automotive equipment. The service lives of the different types of equipment included in this account vary with the nature of the equipment and with the character and amount of its use.

"The fairest method for determining accruals for loss in the service value of this equipment is on the basis of use. However, an accurate record of use has not been maintained. In the absence of such information, loss in service value must be based on age.

"From an analysis of the experience of the company, a composite service life of four years is determined as the reasonable composite service life for this account.

"Undistributed Fixed Capital: The investment carried under this heading includes:

"1. Organization Expense (Account 200). The articles of incorporation provide for perpetual existence of the company and grant the company authority to engage in many activities in addition to its present principal functions. Due to these facts, the amounts in this account are not considered to be subject to amortization or depreciation.

"2. Other Undistributed Fixed Capital (Account 203). The analysis of this account by the Commission's accounting examiners indicates that all amounts therein represent pre-construction expenditures, which are primarily expenditures for engineering service and for reports on the feasibility of the project. A period of 50 years for amortization of these costs was determined as reasonable.

"3. General Construction Items. The amounts so designated represent adjustments in general property construction overhead. In view of the nature of the charges included in this account, it is considered that 50 years is a reasonable period over which these costs should be amortized.

"4. Law Expense During Construction (Account 262). The analysis of this account by the Commission's accounting examiners reveals that all charges included in the account represent expenditures which may reasonably be amortized over a period of 50 years from the beginning of operations.

"5. Interest During Construction (Account 266). Taking into consideration the service life of the entire system, a reasonable period of amortization for this account is 50 years."

The Trial Examiner: Does that complete your direct, Mr. Lange?

Mr. Lange: Yes, just this other:

Q. Turning to the exhibit, Mr. Hill, just following Page 15, marked "Sheet 1 of 3," the figures appearing under the first column "Adjusted Book Costs, December 31, 1939" were taken from Exhibit 146, the plant account of Canadian River Gas Company on Page 62?

A. Yes, sir.

Q. Is that correct, Mr. Hill?

A. Yes, sir.

Q. And that continues over into Sheet 2 of 3 of the same Schedule No. 1 of Exhibit 146 to Page 62, 63 and 64?

A. Well, I don't know, Mr. Lange.

Q. On the plant account of Canadian River Gas Company?

A. Yes, they are the same figures.

Q. And the service life figures under the second column, were those computed by you on the basis of the manner as outlined in the preceding pages of this exhibit in your written statement?

A. Yes, sir.

Q. And the percentages appearing in the third column were then computed by you on the basis of those service life computations?

A. Yes, sir.

Mr. Lange: I believe that is all for the present, Mr. Examiner.

Mr. Spencer: Just one or two questions, Mr. Hill.

Recross Examination.

By Mr. Spencer:

Q. Reading what you have to say on Pages 2 and 3—rather, commencing at the bottom of Page 2 and ending with the first paragraph beginning on Page 3, I assume you have not furnished any computations here with respect to property that is subject to depletion rather than depreciation?

A. No, sir, I have not.

Q. In other words, you have made no computation in connection with leaseholds or intangible well costs?

A. Absolutely.

Q. This study of yours has been confined and limited solely to depreciable property?

A. Depreciable property, yes, sir.

Q. I assume your working papers with reference to this exhibit will likewise be available to us for examination?

A. Yes, sir.

* * * * *

MR. HILL further testified, on cross-examination: (Vol. LII; pp. 7126-7176.)

Q. Mr. Hill, I would like to ask you some additional questions this morning regarding your Exhibit No. 178 which relates to determination of composite service lives of physical properties of Canadian River Gas Company.

At least you have testified heretofore and your written statement so indicates that in determining the lives of the various classes of property owned and operated by Canadian River Gas Company you took into consideration the probable life of the natural gas reserves of the company, is that correct?

A. Yes, sir.

Q. Now, on two or three bases and perhaps more, you found the probable life of these natural gas reserves to be variable terms. The one I have a note on here is indicated as being 56 to 62 years.

A. Yes, sir.

Q. Is that correct?

A. Yes, sir.

Q. Then I believe you had a somewhat longer life on some other bases, did you not?

A. Yes, sir. The only basis that I recall putting in was 56 to 62 years according to my calculations.

Q. Well, that was the probable life that you ultimately used in making your calculations here.

A. Yes, sir.

Q. All right, now, I would like to ask you some questions about that probable life. The spread that you have there of 56 to 62 years, or a spread of eight years, is accounted for how?

A. Well, I merely took the reserve figure furnished to me by the geologists of the Federal Power Commission and then merely made estimates of withdrawals from those reserves. I took the Denver line—I put this in the record yesterday. Do you want me to put it in again?

Q. Perhaps so, because I want to go a little further with that part of it and if we have it in the record at this point it would make the succeeding answers more intelligible, I believe.

A. All right, sir. The approximate annual requirements in Mcf. at 16.4, on the basis—these are all—

Q. Does it bother you if I interrupt you? Have you—Well, strike that.

Give me the figure given to you by your engineering department. I believe it is in your written statement.

A. No, it isn't in my written statement.

Q. All right, that figure is not in your written statement?

A. No.

Q. Will you give it to me for the record the figure you obtained from the geologist department?

A. The reserve at the end of 1939 at 25-pound abandonment was 3,636,000,000 Mcf., at a base pressure of 14.65 per square inch absolute.

Q. In making your estimates, are you reconverting or are you converting again back to 16.4 pressure base?

A. I have taken the annual requirements on a 16.4 base because that is the way I could get them the nearest without converting and at the end of this I have converted back to 14.65 so it gives me nearly the same thing.

Q. So you have taken into consideration in your calculation the difference in pressure base?

A. Yes, I have.

Q. Go ahead with your explanation as to how you computed this period.

A. These will all be in Mcf. at 16.4. Approximate annual requirements Colorado Interstate Gas Company, Denver line—

Q. Will you go slow with those so that I can write them down?

A. All right. 22,000,000—

Q. Even?

A. Yes, sir, these figures have all been rounded off.

Q. All right.

A. Chicago line, the present Chicago line—

Q. Yes.

A. —22,000,000; the second Chicago line, 11,000,000; total, 55,000,000.

Amarillo Oil Company and Clayton Gas Company, 7,000,000—

Q. All right.

A. —company use, 1,000,000; total, it being at a 16.4 base, 63,000,000; total at 14.65 base pressure, 71,000,000.

Q. I see.

A. In the remaining life from 1939, taking the figure that was furnished to me by the geologists, 3,636,000,000 Mcf. It gave me a remaining life of 51 years; the expired life, 1928 to 1939—am I going too fast for you, Mr. Spencer?

Q. Well, the 51-year life you mentioned is 51 years from 1939?

A. That is right.

Q. Now you are talking about the expired life?

A. Yes, sir, that is from 1928 to 1939—

Q. Yes.

A. —eleven years. Total life—

Q. Yes.

A. —in 1928, 62 years.

Q. I think that is good.

Now, you made some adjustments?

A. Yes, I did.

Q. Go ahead with your adjustments.

A. Stimulation due to rate reduction voluntarily or otherwise—

Q. Excuse me. Was that word "stimulation"?

A. Yes.

Q. What do you mean by that?

A. The increase in business.

Q. The increase in sales?

A. The increase in sales.

—Percentage increase, 15 per cent, is adjustment figure based upon results obtained on Denver line after reduction and space heating rates in 1934, and giving consideration to saturation of load.

Q. Saturation where, Mr. Hill?

A. Mostly in domestic gas.

Q. Geographically where?

A. Well, in the Denver area, Colorado Springs, Pueblo—

Q. Is that all?

A. Do you want domestic figures—

Q. Is that the only point you are talking about a saturation?

A. I think most of the saturation would be in the Denver area.

Q. All of the figures you have given me here are what you term approximate annual production requirements for Canadian River Gas Company?

A. That is right, they are approximate figures used in service life estimates.

Q. Now you have assumed that the annual production

requirements of Canadian River Gas Company with the adjustments which you have made for stimulation, as you call it, would remain constant over a period of 56 years?

A. Well, I don't think they remain constant, but at the time this was made these are the best figures.

Mr. March: You didn't say that they remained constant, did you?

The Witness: No, I don't think it will remain constant, but at the time these calculations were made it is the best that we had.

Mr. Spencer: I see.

Q. Before I come to that, perhaps you had better indicate for the record how you dropped down from 62 to 56 years by applying your stimulation factors.

A. All right, sir.

Colorado Interstate Gas Company, Denver line, 25,000,000—

Q. Just a minute. Let me write that down.

A. Yes.

Q. All right.

A. Present Chicago line 25,000,000—

Q. All right.

A. Second Chicago line, taken as one-half of the first, 13,000,000—

Q. Total?

A. Total, 63,000,000.

Q. Amarillo Oil and Clayton Gas Company?

A. Amarillo Oil Company and Clayton Gas Company, 8,000,000; company use, 1,000,000; total at 16.4, 72,000,000; total at 14.65 81,000,000; using the same reserve figure to cover the gas gave me a remaining life from 1939 of 45 years; expired life, 1928 to 1939, 11 years; total life from 1928, 56 years.

Q. I think that explains it, Mr. Hill. Have you ever had any experience in market forecasting?

A. I have made potential load surveys, yes, sir.

Q. For natural gas companies?

A. Yes, sir.

Q. For whom?

A. Southern Natural Gas Company?

Q. When?

A. Well, I have made them all along in town plant distribution systems from 1930 through 1937.

Q. What was the purpose of them?

A. The purpose was for installation of town plants.

Q. The size of pipe, and so forth?

A. I designed the distribution system that was to be put—

Q. You made your forecasting in connection with the construction program?

A. Yes, sir, that is right. It was a potential load survey.

Q. How did your forecasting work out, do you know?

A. Well, the forecasting—sometimes it worked out that we were low and sometimes it worked out we were high; it is just a forecast and that is all you can say for it.

Q. Do you recall the specific period for which you made those forecasts?

A. Well, we would usually make them for maybe five years in advance.

Q. Five years in advance?

A. Five years or so.

Q. Did you ever make a forecast for natural gas production 56 years before?

A. I haven't made a forecast of natural gas production for 56 years—

Mr. March: I object to the question because the question presents something that the witness never testified to. He never testified he made no forecast as to gas in this field. He got those figures from his geologist and all he knows is that his geologist gave him the figures. The geologist was on the stand and he can cross examine him on it. I move the question and answer be stricken from the record.

Mr. Spencer: I don't believe the witness answered the question. It is true, Mr. Examiner, he has used the figures here as to gas reserve that were furnished to him by the geological department of the Commission; it is also true in order to find out what the probable life of these gas reserves is—he says that he gave consideration to it and it is here in his written statement—he would have to find out or make some computation with respect to rate of withdrawals from this reserve and he has just testified at length about the figures he has for the purpose of stating withdrawals.

Now, there is no use quibbling about words; when we are talking about withdrawals here we are talking about markets. It is very important to us to know the basis upon which these withdrawals are figured over a period of years. Otherwise, this whole house of cards falls. Our depreciation and depletion rates are being figured upon this rate of withdrawal which is nothing more than markets. I think we are entitled to explore, Mr. Examiner.

The Trial Examiner: I think you are permitted to. Mr. Spencer.

Mr. Spencer: Now, the question, please, Mr. Reporter.

(The question referred to was read by the reporter, as set forth above.)

The Trial Examiner: I take it, Mr. Spencer, you referred to withdrawal forecast rather than production forecast?

Mr. Spencer: Perhaps so. I will change the question so as to make it less objectionable to counsel perhaps.

Q. We are clear, are we not, Mr. Hill, that you are talking about wtihdrawals here from the gas reserves of Canadian River Gas Company which represents its estimated annual production into the future based upon existing markets? Is that true?

A. Well, these figures that I have used were sales of gas and we have gone back on the company's records and found out what their annual requirements were and have estimated—that is, what they have been in the past and estimated these figures.

Now, if annual sales and withdrawal from the field are the same, well, I'll say yes.

Q. You have nothing here but sales except company used gas in your figures, isn't that right?

A. That is all.

Q. Well, when you get all through with your computation and arrive at 56 to 62 years, you have projected those into the future, haven't you?

A. Yes, we have.

Q. As you understand it, am I doing a violence to the English language when I call that forecasting?

A. I don't know. You can call it estimates or forecasting, either one, but I would call it estimates myself.

Q. Have you ever made any study of this nature covering a period of 56 years or 50 years?

A. I don't understand the qusetion.

Q. Have you ever made any similar study for a period of 50 or 56 years?

A. No, sir.

Q. Well, perhaps we can shorten this by asking this question: Do you consider yourself qualified and competent to forecast markets for a period of 50 years?

A. Well, I don't think I have—

Q. Now, just the question.

The Trial Examiner: You may answer it your own way, Mr. Hill.

The Witness: I don't think I have forecasted a market of 56 years, Mr. Spencer. I have merely estimated the amount of gas that would ultimately be the sales for this line. It is an estimated figure.

By Mr. Spencer:

Q. We come to this, then, that you do not pretend to say that the actual withdrawals of gas from this property by Canadian River Gas Company are going to be *anywheres* near what you have indicated here?

A. Well, I couldn't say because the figures were just what we had to determine service lives on this property and that is the only way we have used them.

Q. As a matter of fact, within five years Canadian River Gas Company may be producing and selling twice as much gas as you have indicated here?

A. If I have overlooked things that may happen, yes, sir, it will. I have taken everything into consideration that I had at the present time.

Q. Well, that is what a forecaster does. He takes all of those things into consideration.

A. I tried to—I have taken those into consideration in arriving at these figures.

Mr. March: Mr. Spencer, I think I can help you clear this up if you will let me ask a question in the record here.

Mr. Hill, as I understand, you just had the past withdrawals before you and just for the purpose of this study you assumed that—you just projected those into the future. You don't mean to state here in the record that you would attempt to state that that is what will happen in the future, do you?

The Witness: No, sir.

Mr. March: You don't make any future withdrawals—they may be double—you are familiar with the testimony—

The Witness: They may triple, I don't know. These are the best figures I had for my study.

Mr. March: You are familiar with the testimony that has been given here that there will be some increase in the withdrawals in the future?

The Witness: Yes.

Mr. March: And for the purpose of your study here you just projected this past performance in to the future but you are not stating here that that is what will happen in the future or attempting to state that that is what will happen in the future?

The Witness: No, sir, I am not. I used them for my purpose and that is all.

Mr. March: Mr. Hill, you have made no detailed study of the future requirements for Chicago or the proposed Milwaukee market drainage upon Canadian River acreage?

The Witness: No, I have not.

Mr. March: The only thing you know about that is what the company has put in evidence in this case?

The Witness: That is all.

Mr. March: And that was after you prepared this exhibit?

The Witness: Yes, sir, after I have used these figures.

By Mr. Spencer:

Q. And the company has put in no figures estimating future markets beyond 1947, is that correct?

A. As I recall it, yes, sir, it is.

Q. And in addition to the present market specified by Mr. March in his questions I assume neither have you taken into consideration any additional pipe line markets that Canadian River might have in the future? I think that follows, does it not?

A. Yes, sir, none other than this Chicago second line.

The Trial Examiner: Well, that Chicago second line, Mr. Hill, is that the line that is contemplated to include service to the City of Milwaukee?

The Witness: Well, there was two proposals in there, now. I don't know how it worked out—the Natural Gas Pipeline Company of America and I think the Western Natural or something like that, trying to get a line in.

The Trial Examiner: Just proposed a loop line initially?

The Witness: Yes, sir, as far as Natural Gas Pipeline Company of America it would be.

By Mr. Spencer:

Q. When the geological department of the Commission gave you this Canadian River Gas Company reserve figure of three trillion, six, plus, did they give you a report with it just what it represented?

A. No, sir, they just said that that was the recoverable gas under the Canadian River acreage.

Q. Did they say recoverable by whom?

A. No, sir, they did not.

Q. And you have just assumed it would all be recoverable by Canadian River Gas Company?

A. Yes, sir, that is right.

Q. You have not taken into consideration that it might be recovered by somebody else through drainage or otherwise?

A. I have made no study of that, Mr. Spencer. I wouldn't know. I just accepted these figures as they were handed to me, that's all.

Q. You just made straight mathematical calculations using the figures that they gave you, using the production figures that you have estimated?

A. Yes, sir, that is all.

Q. And arrived at a certain number of years?

A. Yes, sir, that is right.

Q. And that figure assumes that Canadian River Gas Company will recover all of the gas shown in the figure given to you by the geological department?

A. Yes, sir.

Q. You have testified regarding your natural gas pipe line experience. Have you ever had any experience in the producing of natural gas?

A. Very little, Mr. Spencer.

Q. Very little?

A. I have had some experience with it in the Monroe field but it has been limited.

Q. Did you ever supervise the drilling of wells?

A. No, sir, I have not.

Q. Did you ever supervise the gathering of natural gas?

A. No, sir.

Q. Most of your natural gas experience has been connected with the transmission and distribution end of the business, is that correct?

A. Yes, sir, most of it.

Q. Now, this figure of Canadian River gas reserves which was handed to you by the geological department is based upon a 25-pound abandonment pressure, is it not?

A. Yes, sir.

Q. Do you know anything about abandonment pressures in the gas field?

A. Well, I know that in the Monroe field the abandonment pressure there was fifty pounds.

Q. But I take it you had no experience in trying to figure out what the abandonment pressure should be, for instance?

A. No, sir, I have not made any study of that, Mr. Spencer.

Q. Well, now, let me ask you this: We have a life of 45 years, let us assume, according to your calculations, commencing August 1, 1939. Do you have any idea how many hundred wells would have to be drilled by Canadian River Gas Company in order to recover the gas that you have indicated here down to a 25-pound abandonment pressure?

A. No, sir, I do not. I have made no study on it.

Q. Well, doesn't that become of some importance and some significance in determining what your rate of depreciation should be for the well investment?

A. Well, yes, it does, and I have, as far as I could see, I have given that some consideration.

Q. Well, you can come to that in a minute. I want to follow with a couple of other questions here. Let us assume that in order to recover all of this gas down to a 25-pound abandonment pressure it became necessary for the company to drill during the last two years of the life you have indicated here, two hundred wells. Over what period and at what rate would you judge the two hundred wells should be amortized for retirement purposes?

A. Well, in the first place, I don't think they will drill two hundred wells.

Q. Well, in the first place I asked you to assume it and let's see how it develops.

A. Well, in assuming that you would take into consideration, which I have, the present wells of the Canadian River Gas Company.

Q. Do you mean to say, then, that whatever wells they may be required to drill the last few years of the life indicated by you, they will still take the composite rate for retirement purposes that you have indicated here?

A. Some of these wells, Mr. Spencer, may go twenty years, some may last sixty. This is an average life that I put on that, and over that time. I have made an estimate of the average life and I think that is a fair and reasonable figure.

Q. And the well or wells drilled by the company for the purpose of recovering the gas that you have indicated here drilled during the last two or three years would still be entitled only to a rate of 2.56 per cent?

A. This is a group depreciation rate. As I said before, some of these wells may live longer. Some may live shorter. The average life that I placed on them of 40 years will mean that you would maybe over-accrue on some of them and under-accrue on some of them, but this is the average life I have put on them, and it is a fair and reasonable life according to the knowledge that I had.

Q. I am not questioning that you haven't attempted here to be fair and reasonable. I am questioning whether or not you have taken into consideration all of the factors that you should have taken into consideration in order to arrive at the correct answer.

Now, let me ask you this: Do you know as an engineer

that the lower the abandonment pressure that you use, the greater the number of wells which would be required to take out the gas, is that correct?

A. Yes, sir.

Q. That is axiomatic almost, isn't it?

A. Yes.

Q. Don't you think as an engineer that before arriving at this composite rate of yours for our well account that it would have been advisable for you to determine the number of wells which the company would have had to drill to recover the gas down to a 25-pound abandonment pressure, and don't you think that would have given you a little better picture upon which to base your rate?

A. No, sir, I don't think so, because I am setting a service life under present conditions there and I put an average life on it and some of those present wells may live to be 60 or 70 years or they may live to be a hundred, I don't know. I placed an average life on there which I think, to my best information that I had, is a fair life.

Q. Is your average life based upon existing wells?

A. Yes, it is based on existing wells.

Q. And the number is what?

A. Number of wells?

Q. Yes.

A. 97, if I remember right, Mr. Spencer.

Q. And for the purposes of your calculation you did not need to take into consideration the number of wells and the time at which they would be required in the future?

A. Well, I have made that allowance—

Q. Was it necessary?

A. I didn't understand the question.

Mr. Spencer: Read the question, Mr. Reporter.

(The question referred to was read by the reporter as set forth above.)

The Witness: I don't think so as far as an average life or composite rates.

By Mr. Spencer:

Q. And am I correct in saying that substantially your composite rate is based upon existing wells?

A. Well, as I stated, it is an average rate.

Q. Well, you haven't—you have to have something to get an average from, Mr. Hill.

A. And it is based—some of them may live longer and some of them may live shorter, as I have stated. I have no doubt, as I say, that some of those wells might live 70 years or a hundred years, but some of them may go shorter and according to my calculations I have arrived at 40 years.

Q. All right, the point I am making is this, that quite aside from the physical life of these wells the company is going to have to drill wells during the latter part of this period you have indicated in order to get gas out of them, and the lives of those wells are not limited by the physical elements involved here; they are limited by these reserves which are going to play out. Did you take those wells into consideration in arriving at your average composite rate?

A. I have not determined any salvage on well casing for the Canadian River Gas Company wells drilled at a later period. Like you say, for two years before this field was depleted you should have—get your money back out of that well, that is true, but it would have a higher salvage value than was figured on present well equipment on the basis of 40 years service life.

Q. Are you familiar with a rotary drilling operation which the company now is using?

A. Yes, I have seen rotary drills work, yes, sir.

Q. How much salvage do you think there is in a rotary drilled well in the Texas Panhandle field?

A. Well, are you talking about the hole or the casing now, Mr. Spencer?

Q. When I speak of salvage I am speaking of anything that will return to the company some amount of dollars when they abandon the well.

A. They have salvage value in some casing there—

Q. Isn't it a fact that salvage value is very low on a rotary drilled well?

A. Yes, sir, it is.

Q. You say that the company now has 97 wells?

A. I think that is correct, yes, sir.

Q. Now let us assume that everything is going to work out just the way you pictured it here and that your reputation as an estimater is going to be approved one hundred per cent; that at the end of your 40 years the company has

700 wells instead of 97 wells. Would that mean anything to you in determining your average composite rates for the purposes of determining what should be done with reference to this well account?

A. No, sir, not on the present day wells.

Q. All right. One other question before I forget it.

As I understand it, the Canadian River Gas Company's reserve figure of three trillion, six hundred billion is handed to you by the geological department of the Federal Power Commission?

A. Yes, sir.

Q. And then you hand it on to the accounting department?

A. Well, I think they get it from the geological department, too, just like I did.

Q. You hand it on to them in so far as it is included in your retirement rates here?

A. Yes, sir, that is right.

Q. Turn to Page 3 of your written statement. Under the heading "Gas Well Equipment," Account 212, you state that a composite service life of 39 years has been determined for gas well equipment. What classes of property have you included in that for the purposes of determining a composite rate?

A. We have included the casing and the Christmas trees.

Q. Oil well fittings?

A. That is right.

Q. The bulk of the investment would be in casing?

A. Yes, sir, I think so.

Q. The intangibles in the well you have not included?

A. I have not, no, sir.

Q. Those are subject to depletion and not depreciation?

A. Yes, sir.

Q. I believe you testified before that your study does not include any depletible property as distinguished from depreciable property?

A. I think I stated right above there, Mr. Spencer, that gas well construction was not determined by me.

Q. Now, if it wasn't for your composite rate and you were fixing an individual rate for the well equipment, you would have established a 40-year life, as I understand it?

A. Well, the 17 wells that were acquired from other com-

panies is what brought it down to 39 years, if that is what you mean.

Q. Is that what brought it down?

A. Yes, sir.

Q. Are those 17 wells that have been acquired by the Canadian River Gas Company since the beginning of its operation in 1928?

A. Well, I would have to get my working papers if you wanted to know exactly when they were acquired.

Q. It isn't that important.

You do not include in the category the wells that Canadian River Gas Company acquired from Amarillo Oil Company?

A. No, sir.

Q. Have you treated those differently?

A. I have treated the Amarillo Oil Company's wells and the wells acquired by the Canadian River Gas Company from the Amarillo Oil Company the same.

Q. The same?

A. Yes, sir.

Q. You might as well have included them in the figures you use here—I mean the figure of 17 wells—because they were acquired from another company.

A. Well, we have treated the Amarillo Oil Company as a predecessor company of Canadian River Gas Company.

Q. You have treated the wells acquired from the Amarillo Oil Company the same as the wells acquired from other companies?

A. No, sir, we presumed the wells acquired from other companies were wells that had presumably had the depreciated cost allowed for that life of the wells before they were acquired by the Canadian River Gas Company.

Q. And in the case of Amarillo Oil Company wells you have done something differently?

A. Yes, sir.

Q. That is what I wanted to bring out, that there is a distinction in your treatment of them.

Now, you say here in the determination of service lives for gas well equipment ten inspections of the above-ground property were made at locations picked at random through the field. What did you inspect, Mr. Hill?

A. We merely looked at what equipment we could see on top of the ground. We didn't inspect any casing, as cas-

ing retirements have been very light on the Canadian River's property.

Q. Have you ever had any experience before in the Texas Panhandle field?

A. No, sir, I have not.

Q. Did you examine the logs of the wells now owned and operated by Canadian River Gas Company?

A. No, sir, I did not.

Q. Do you know anything about the formations that they go through or the conditions of the holes?

A. Just a general knowledge is all I have.

Q. I believe you say that no inspections on well casing were made?

A. Yes, sir.

Q. You are not prepared to testify, then, from your knowledge of the formations in which this casing is fixed or the condition of the hole, as to what composite rate should be on gas well equipment?

A. As I say, I have just a general knowledge of the field. I have made no study. I have seen some well logs of that field but I have made no study of them.

Q. Do you know anything about the problems encountered by gas companies operated in the Texas Panhandle field with respect to the salting up of wells?

A. Well, I know that they are not troubled with salt water there. I have made inquiry into that, about the experience the company has had with wells there, and the information I received back was that they hadn't had a great deal of trouble with water encroachment and the only trouble they had had was some surface water trouble.

Q. Do you know that we do have salt formations?

A. Yes, sir.

Q. We have those?

A. Yes, sir.

Q. Do you know that the Texoma Natural Gas Company has abandoned several wells—I think seven—by reason—

Mr. March: If the Examiner please—

Mr. Spencer: Just a minute. I want to find out how much he knows here—

Mr. March: I want to state for the record, Mr. Spencer, that the questions should be directed to our geologists. Our

witness doesn't know anything about geological formations in the Texas Panhandle field, and if you insist on asking the question he can only state that he doesn't know.

The Trial Examiner: He can state whether he knows.

Mr. March: It is improper, Mr. Examiner—

Mr. Spencer: I would like to answer, Mr. March, that the only thing he has testified to so far is that he obtained from the geologist the gas reserve figures and he has taken that and then from his knowledge and experience the company, as he indicates in his own judgment as an engineer, has fixed retirement rates on this property. All I want to find out is how much he knows. If he doesn't know about it or if he got this from the geological department, he can say so.

Perhaps I had better restate the question again.

Q. Do you know that the Texoma Natural Gas Company which owns and operates gas wells in the same field has been required to plug and abandon several wells by reason of this salting condition I mentioned to you?

A. I know that they have abandoned some wells over there, but I don't know the reason for it.

Q. Do you know how many wells have been reported to the Texas Railway Commission as making salt water in the Texas Panhandle field?

A. I don't know of any of the present wells of the Canadian River Gas Company.

Q. Do you know how many in the field have been reported?

A. No, sir, I don't. I do know that the acreage of the Canadian River Gas Company is on the high part of the field. I know that.

Q. Are we speaking geologically now, Mr. Hill?

A. No, sir, I am not speaking geologically.

Q. You mean it is just the high place there?

A. Yes, sir, it is just from general knowledge and that is all.

Q. Don't you know as a matter of fact that the Canadian River Gas Company has wells that are making salt water right now?

A. Well, not from the information I had, Mr. Spencer. I can give you the information I have had if you want it.

Q. No, what I want to know is from your own information if that is not so.

A. I would like to check that if you don't mind.

Q. All right.

A. Would you like for me to read this letter from Mr. Hendee?

Q. If it answers the question it is perfectly satisfactory.

A. This is a letter written by Mr. Robert W. Hendee to Mr. J. B. O'Connor—

The Trial Examiner: What is the date of that letter, Mr. Hill?

The Witness: October 26, 1940.

"Confirming our telephone conversation this morning regarding request contained in your letter of September 23, 1940, the following is quoted from a letter which Mr. R. A. Ford wrote me some time ago:

"'Referring to your letter of the 25th enclosing copy of the letter from Mr. O'Connor asking for certain information concerning factors causing deterioration of well casing, beg to advise we have never conducted any series of tests to develop any information along the lines of the request. We are beginning to give some consideration, but to date no data has been assembled whereby it would reflect any authentic information. We have, of course, had some repair work on old wells where there had been water intrusion through pipe that had holes in it and in others where water was leaking in by the shoe but all of the well repairs have been different and we cannot assign any of the conditions he refers to in any particular wells we have worked over.'".

Mr. March: If you have no objection, Mr. Spencer, he might read Mr. O'Connor's letter so that we can tell what Mr. Hendee is talking about.

Mr. Spencer: That will be satisfactory.

Mr. March: Do you have that letter, Mr. Hill?

The Witness: I don't have a copy of it here.

Mr. March: Please get that letter later so we can have the continuity of it carried out because he is talking about

things there we wouldn't know anything about unless we had it.

The Witness: All right.

By Mr. Spencer:

Q. Did you make a study, Mr. Hill, as to the character of the 97 wells that Canadian River Gas Company now owns and operates, that is to say, whether they were rotary wells or cable tool wells?

A. I talked with Mr. R. A. Ford and from my understanding from him they use a rotary well down to what he determines the rock and then he goes to a rock outfit. That was my information from Mr. Ford.

Mr. Lange: Who is Mr. Ford.

The Witness: Mr. R. A. Ford is General Superintendent, I believe, of the Canadian River Gas Company.

By Mr. Spencer:

Q. All of the earlier wells drilled were acquired by Canadian River Gas Company, were they cable-drilled wells?

A. That is my understanding from Mr. Ford.

Q. Now, in determining your composite life here for gas well equipment, did you make any distinction between cable tool wells and rotary wells?

A. I don't think that would have any effect upon the life of the casing.

Q. You did not take it into consideration?

A. No, I did not take that into consideration.

Q. How many strings of casing do you ordinarily find down there in a cable tool hole?

A. I know back in the cable tool days that you would have maybe three or four strings of casing in there; at the present time it is my understanding from Mr. Ford that they are using entirely 8-inch casing.

Q. How many strings of casing are there in a rotary hole?

A. Well, he may use one or maybe two strings. Sometimes he may go to the bottom of the hole with 8-inch casing.

Q. Now, do you feel as an engineer that the additional strings of casing in the hole might have any bearing upon the life of the well?

A. You mean the life of the well or the life of the casing?

Q. The life of the well.

A. I am not determining the life of the well, merely the casing that is in the well is what I have set a life on.

Q. Well, if you have to abandon a well, the life of the casing has expired for the purposes of your work hasn't it?

A. Yes, we have taken that into consideration—

Q. Are you talking about the same thing? The life of the well is the life of the casing for that purpose, isn't it?

A. Read the question, please.

(The question referred to was read by the reporter, as set forth above.)

The Witness: That is, for forecasting purposes, yes, sir.

By Mr. Spencer:

Q. I mean to say this: If you have to abandon a well, you lose both the well and the casing; you are figuring no salvage value?

A. That is right.

Q. So they are the same thing?

A. Yes, sir. I figured no salvage value on it.

Q. And you do not feel that the added strings of casing in the well has any bearing upon the life of the well?

A. I think you are getting out of my line. I am not attempting to testify as to that.

Q. All right.

A. All I have figured depreciation rate on is the casing.

Q. I thought we had come to the point where the life of the well and the life of the casing were synonymous for all practical purposes to the company, at least?

A. No, sir. There might be some salvage value on casing if you abandoned a well in five, six, or two years after you put it in, but I figure no salvage value at all. In that case the life of the well would naturally be the life of the casing, and if you salvaged that casing—

Q. You think the life of the well might be longer than the life of the casing?

A. Yes, sir.

Q. Might the life of the well be shorter than the life of the casing?

A. Yes, sir.

Q. Which means nothing if you take out the factor of salvage, which you have done?

A. I haven't figured any salvage at all.

Mr. Spencer: We might take a short recess, Mr. Examiner.

The Trial Examiner: Very well, we will stand in recess for five minutes.

(At this point a short recess was taken, after which proceedings were resumed as follows:)

The Trial Examiner: The hearing will be in order.

By Mr. Spencer:

Q. Mr. Hill, I have been asking you questions concerning your knowledge of the field and well conditions of the Canadian River Gas Company. Now, I wish you would tell me as briefly as you can how you arrived at a 40-year life for gas well equipment on the Canadian River Gas Company.

A. Well, I think the method I have stated in my written statement.

Q. You mean, first you have used the company's experience with the deterioration of well casing?

A. Yes, sir, that is right.

Q. And second, you have relied upon your inspection of the field lines?

A. That was taken into consideration, yes.

Q. And third, your estimate of natural gas which will be produced in the present properties of the company?

A. Yes, sir.

Q. And in that connection you say that you have made no inspections on well casing?

A. That is right.

Q. You have made no examination of well logs?

A. No, I didn't make an examination of well logs.

Q. You have no special knowledge of the condition of the wells of Canadian River Gas Company?

A. None other than what was given me by Mr. Hendee.

Q. I would like to ask you another general question.

I take it that the life that you have found for transmission lines, namely, 50 years, is the maximum life that you use here?

A. Yes, sir, that is right.

Q. And that if the life of a well is 40 years we must assume, then, that all of the present well will have been abandoned and passed out of existence prior to the end of your 50-years, is that correct?

A. No, sir, this is an average life I have figured. Some of those wells may live to be 60 years and some may go in 30 years. This is an average life I have put in—not of the well, but on the casing.

Q. An average life for the wells?

A. For the casing.

Q. For the casing?

A. Yes, sir. As I have stated in my written statement here "Gas Well Construction Cost," Account 211. "The life of property in this account has not been determined by me and is not shown in this exhibit."

Q. Well, if the average life is 40 years, then we must assume that some of these wells will have gone out of existence prior to the end of the 50-year life of the transmission line? Some of them will be gone.

A. More than likely will have.

Q. That follows, doesn't it?

A. Yes, sir. Some may go earlier and some may go later.

Q. Is it fair to say that those wells must be replaced with new wells—I mean, the wells that are going to be abandoned and will pass out of existence?

A. Well, if they are abandoned, they will have passed out of existence.

Q. The question was directed to replacement, Mr. Hill.

A. The replacement of that well will be up to the company.

Q. After all, we have to have something out of which to produce gas if we are going to have the production you have indicated here, is that not correct?

A. Well, I don't know. I haven't indicated the production. These are sales.

Q. What is the difference between sales and production as far as Canadian River?

A. I don't know whether it requires all the wells you have to produce this or not. You may be able to produce more than this on the present wells.

Q. You haven't taken into consideration the number of

wells required to produce the gas over the period which you estimate?

A. No, sir, and I don't think I would have in figuring average life, with casing.

Q. And the additional wells with casing in them or replacement wells as I have termed them before, are not taken into consideration here in your computation?

A. They are taken into consideration in so far as I have cut the life of the casing back—will you read the question, please?

(The question referred to was read by the reporter, as set forth above.)

The Witness: I don't think that would have anything to do with the life of the present casing.

By Mr. Spencer:

Q. Well, they weren't taken into consideration, then?

A. No, sir.

Q. All right. Now, you mentioned specifically here the company's experience with deterioration of well casing, and I believe in many other instances you have relied upon or at least considered the company's experience in making your calculations.

I have taken it into consideration, yes, sir.

Q. Now, what has been the length of the company's experience to date?

A. Well, you mean the Canadian River Gas Company?

Q. Yes.

A. I would say approximately eleven years.

Q. And your maximum life figure is 50 years?

A. Yes, sir.

Q. That is to say, you have only eleven years experience upon which to base an estimate for a period of 50 years, is that correct?

A. Well, as far as this company is concerned, yes, sir.

Q. As far as this company is concerned?

A. Yes, sir.

Q. And I presume it follows that if there are any errors in your calculations they will come off the last end of your term rather than the first end?

A. What was that question?

(The question referred to was read by the reporter as set forth above.)

The Witness: Well, these are all average lives, Mr. Spencer.

By Mr. Spencer:

Q. Yes.

A. And they all have a tendency to equalize themselves out.

Q. In other words, we have had eleven years experience and we have 38 years within which the errors, if any, may develop?

A. Well, these are estimates of life and—

Q. Well, I think that follows, Mr. Hill. I won't ask you—

Do you know anything, Mr. Hill, about the requirements of Texas statutes or the Texas Railroad Commission—

Mr. March: To which question we object.

The Trial Examiner: He hasn't finished the question yet, Mr. March.

Mr. March: We object to any question regarding the statutes—

Mr. Spencer: Wait a minute. I just asked him if he knew.

Before I was so interrupted, what did I say?

(The record referred to was read by the reporter, as set forth above.)

By Mr. Spencer.

Q. —relating to the production of natural gas in the state of Texas and particularly with respect to limitations upon production in connection with open flow capacity?

Mr. March: We object to that question. It is an improper question. It involves a question of statutes and is something that the witness did not have to consider in this exhibit and we don't think the witness should be required to answer it.

The Trial Examiner: He can state whether he knows.

The Witness: I know in a general way, yes, that they have proration laws in the state of Texas.

By Mr. Spencer:

Q. Now, did you take those requirements into consideration in making your calculations?

A. No, sir, I did not.

Q. Now, in your written statement under the heading "Field Line," you find that a 50-year service life is reasonable for the main trunk line? Is that correct?

A. Yes, sir.

Q. Did you make that finding because you considered it had the same permanency as transmission lines?

A. I think it has, yes, sir.

Q. In other words, you felt it was of such a character as to take the same rate as transmission lines?

A. Yes, sir, I think it is permanent. I don't think it will be moved, if that is what you mean.

Q. Well, did you find any factor that in your investigation, that would lead you to increase the life of the main field line over the transmission line?

A. No, I considered them the same, Mr. Spencer. I don't think the line will be moved.

Q. Now, do you know the wall thickness of this main field line?

A. Yes, sir.

Q. Can you give me that, please?

A. You have several different sizes and weights, Mr. Spencer. Do you want all of them?

Q. Give the wall thickness.

A. They are all the same wall thickness, 5/16ths of an inch.

Q. All right, now, will you give me the wall thickness of the transmission line of Canadian River Gas Company out of the Bivins station?

A. Three-eighths of an inch.

Q. Three-eighths?

A. Yes, sir.

Q. So we have a difference in wall thickness of how much between the transmission line and the main field line?

A. Well, that would be—

Q. One-sixteenth of an inch, isn't it?

A. One-sixteenth, yes, sir.

Q. Now, do you think that wall thickness has anything to do with the life of a piece of pipe?

A. Yes, sir.

Q. Did you take it into consideration here?

A. Yes, sir.

Q. And for the purposes of your study you find the same life for a piece of pipe with a wall thickness of 5/16ths of an inch as you do for a piece of pipe with 3/8 of an inch wall thickness?

A. No, sir, but the physical life is not determined the determined factors for the life of this pipe. It is the functional life of the field that has been given consideration in cutting the life of this pipe back to 50 years.

Q. I see. What you are expressing here in your 50 years, then, is the life of the gas reserves as you find them rather than the physical life of the pipe?

A. According to my calculations, yes, sir.

Q. I didn't get that out of your statement, Mr. Hill. I think you have answered it sufficiently, then.

For instance, on Page 5 of your written statement, the second paragraph, you state: "A 50 year service life is considered reasonable for the main trunk line F-1."

A. Yes, sir.

Q. And I certainly obtained the impression there that you were finding service life for the physical property itself without relation to gas reserves and in that I am incorrect?

A. That is not the determining factor, Mr. Spencer.

Q. Now, turn to your written statement which relates to other field facilities, and there you find a composite service life of 23 years as being applicable to the field measuring stations structures and field measuring station equipment; that is correct?

A. Yes, sir.

Q. Do you know as a matter of fact that the company has rebuilt every field measuring station that was originally constructed in 1928 as of this date?

A. I don't know that they have rebuilt them all, Mr.

Spencer. I know that they have rebuilt some houses there.

Q. Well, assume I am correct, that during the past eleven years the company has rebuilt every field measuring station that it had in 1928. Would that not indicate a life of eleven years rather than 23 years for those structures?

A. If they have all been replaced in eleven years it would, yes, sir.

Q. And in answering some of Mr. Dougherty's questions you—

A. I want to correct that last statement I made Mr. Spencer—

Q. Very well.

A. —if you don't mind. That would not be the life of eleven years because we figured this on an average life basis and it may be that some of them would go out in five years and some of them might last longer, because all the lives that we have figured have been on an average life basis.

Q. All right. If we have had to rebuild every one of them that we had in 1928 in eleven years, and you arrive at a composite service life of 23 years, it looks to me like you are going to have to build some brick houses or something in order to raise that average up to 23.

A. Taking into consideration the brick meter stations on the Chicago line that is included in this account is what runs the composite of this account up a little.

Q. Are you familiar with corrugated iron structures in the Texas Panhandle field?

A. Well, I am familiar with corrugated iron structures. As I stated before, I have not had a lot of experience in the Panhandle field.

Q. Well, they are a little different in the Texas Panhandle field. In riding along the highways of the Texas Panhandle field, did you notice the corrugated iron strung all along the highway, pieces of it all wound up here and there?

A. Yes, sir, I have noticed some of it.

Q. Where did you think that came from?

A. I have no idea.

Q. It may be very dry in the Texas Panhandle field, but they also have wind and sand to contend with, too, do they not?

A. Yes, sir.

Q. From the evidence you see over the terrain, this wind perhaps has something to do with the tearing these corrugated iron structures, does it not?

A. Well, they may blow off a sheet, but that is a maintenance job to put it back.

Mr. March: It doesn't destroy the iron, does it—the wind?

The Witness: Well, it might bend it up, but that is a maintenance job.

Mr. March: There would still be some sort of salvage to that, wouldn't there?

The Witness: I don't think so.

Mr. Spencer: You can have it.

Mr. March: It must be in awful fine pieces.

By Mr. Spencer:

Q. Well, one brick structure you say raised the composite rate which you found?

A. Yes, sir.

Q. How many other field measuring stations are there?

A. Well, I would have to go back in my working papers.

Q. About the same number of field measuring stations as there are wells?

A. Approximately, yes. There are some additional measuring stations, of course the measuring station on the gas to Amarillo Oil, that was taken into consideration, too. I would have to go back to my working papers.

Q. You have one brick structure and ninety some corrugated iron structures, is that not true?

A. I wouldn't want to state until I had my working papers to check it.

Q. We have ninety some wells, do we not?

A. Yes, sir.

Q. We have one of those structures at about every well, do we not?

A. I think so, and also measuring gas to the Amarillo Oil Company. I might have that number here.

The Trial Examiner: What rate did you put on the

galvanized iron structures, Mr. Hill, or did you put any specific rate on those structures?

The Witness: It was all figured in a composite rate. I have placed 20 years on them. That is figured in the composite.

By Mr. Spencer:

Q. 20 years for corrugated iron structures?

A. Yes, sir, on a wood frame.

Q. Now, turn to Page 10, Mr. Hill, of your written statement, that paragraph which is headed "Dehydration Plant." You find the composite service life of 25 years for dehydration plant equipment, did you not?

A. Yes, sir.

Q. To what extent did you consider obsolescence in fixing that rate?

A. Well, I considered—in fact, I talked with people that were familiar with this property and—

Q. I believe you mention in your statement, inquiries were made of responsible parties?

A. Yes, sir.

Q. Who were they?

A. Stearns-Roger Manufacturing Company.

Q. Denver, Colorado?

A. Yes, sir.

Q. And is your rate here based upon what they told you or is it based upon your own judgment?

A. My rate is lower than what they told me, Mr. Spencer.

Q. Well, is it based upon your judgment or—

A. Yes, sir, entirely on my judgment. I just merely used that as a guide to get all the information. The plants are relatively young and there has not been a great deal of experience with them.

Q. Would you consider that the company has a modern plant; that is to say, a plant that has the benefits and advantages of all recent improvements and inventions for dehydration of gas?

A. Well, if that is all you want to do, I would say yes it is. Of course, there are better systems, but I don't think that Canadian River Gas Company will abandon this dehydration plant to put in one just because of a different design. I don't think that.

Q. There are better systems?

A. I think the Glycol system is a better system. That is my own opinion.

Q. What is the chemical they use here for dehydration medium?

A. They use some type of—not being a chemist, I can't carry these things in my mind—some sort of sodium chloride or hypochlorite or something like that.

Q. Any time I get out of your field, you just say so. Do you know whether or not that is highly corrosive chemical.

A. It is corrosive with the presence of free oxygen, which you shouldn't have in this plant.

Q. That would be one factor that you would have to look at in determining the life of this particular plant?

A. Well, according to the best information that I have, as long as there is absence of free oxygen, it is not very corrosive. That is my information.

Q. Do you know as a matter of fact, that the piping in the brine storage tank at this plant was completely replaced in a period of three years?

A. Yes, sir. I know that there has been some replacements there and that is the reason I have cut this life back to 25 years. The majority of your investment is not in the brine storage tank.

Q. Well, would you consider replacement of piping in the brine storage tank to be maintenance, then?

A. Well, I adhered to the retirement units shown in the appendix of the classification of accounts, and that would govern that as far as I am concerned.

Q. I am talking only about replacements of these particular items of property.

A. If it was a unit within itself it would be a replacement unit, yes, sir.

Q. And it would not be considered as maintenance by you for the purpose of your study here?

A. No, sir.

Q. It would not?

A. If it was an entire unit that you took out.

Q. But you do know that this particular part of the dehydration plant required replacement in three years? You are aware of that fact?

A. Yes, sir. It is a very minor part of the whole plant, though, Mr. Spencer.

Q. Now, in making your determination of service lives as contained in this study, Exhibit 178, did you give any consideration to service lives as used by the company for income tax purposes?

A. No, sir.

Q. Did you find out that, in the course of your examination that engineers for the Bureau of Internal Revenue has made an investigation of this same subject matter?

A. I understand they have, yes, sir.

Q. Did you find out the results of their study?

A. I know the depreciation rates the company is using, yes, sir.

Q. But you gave no consideration to that here?

A. Not in determining my service lives, no, sir.

Q. In making your determinations of service lives here, did you give any consideration to the lives of the principal contracts under which the company operates?

A. No, sir, I gave no consideration,—if you are speaking of contracts between the Colorado Interstate Gas Company and the Canadian River Gas Company, I gave no consideration to that.

Q. Nor to the contracts between Colorado Interstate Gas Company and the Public Service Company of Colorado?

A. No, sir, I have no reason to—

Q. Well, whatever you have done here is without regard to those contracts?

A. Yes, sir.

Q. Or any terms fixed therein?

A. Absolutely. That is right.

MR. HILL also testified in connection with this subject under title 27 supra.

The determination of the necessary annual allowances for depreciation and depletion on a regulatory rate basis during the period January 31, 1939, to December 3, 1956, is contained in Exhibits 276 and 277, Witness Lusk, and is abstracted infra. Mr. Lusk in those exhibits, in using the period mentioned, adopted the testimony of the Witness Hendee, General Manager of respondent (Exhibit 255),

showing that the economic life of the field would cease by the end of 1956, and he also used the sinking fund method, with interest at 2¾%.

The Commission also presented Exhibit 190 setting forth an alternate method of accruing depletion. MR. LUTTRING testified in connection with this exhibit as follows: (Vol. LVIII, pp. 8253-8267.)

Direct Examination.

By Mr. Lange:

Q. You are the same Carl E. Luttring that has heretofore testified in these proceedings?

A. I am.

Q. Mr. Luttring, I will ask you whether in connection with your work you have prepared another exhibit in connection with the Canadian River Gas Company matter that would give effect to an alternative method of accruing annual and accrued depletion of gas well intangible costs?

A. I have.

Q. Is this the exhibit prepared by you?

A. Yes, sir, it is.

Mr. Lange: May the stenographer mark it for identification?

The Trial Examiner: It will be marked for identification as Exhibit No. 190.

(Exhibit 190, Witness Luttring, marked for identification.)

By Mr. Lange:

Q. Now, Mr. Luttring, in connection with the preparation of that exhibit did you also prepare a written statement summarizing the main portions of the exhibit and explaining it?

A. I have, yes, sir.

Q. Will you proceed to read that written statement into the record?

A. "The purpose of this supplementary report is to reflect in the balance sheet at December 31, 1939, and income and earned surplus account of Canadian River Gas Company for the year ended that date, the effect of depletion of well construction costs as determined in accordance with the alternative method proposed by the Division of Gas

Engineering. The following schedules which form this report reflect the effect of the depletion computed pursuant to the alternative method:

"Schedule No. 1 Condensed Income and Earned Surplus Account As Adjusted for the Year Ended December 31, 1939, Giving Effect to Alternative Depletion as Proposed by Supplemental Entry.

"Schedule No. 2 Balance Sheet As Adjusted December 31, 1939, Giving Effect to Alternative Depletion as Proposed by Supplemental Entry.

"Schedule No. 3 Examiner's Supplemental Entry to Give Effect to Alternative Method of Accruing Depletion of Gas Well Intangible Costs as Proposed by the Division of Gas Engineering.

"Schedule No. 4 Summary of Annual and Accrued Depletion and Depreciation of Gas Plant in Service at December 31, 1939, After Giving Effect to Alternative Depletion as Proposed by Division of Gas Engineering.

"The exhibit already presented on annual and accrued depletion and depreciation reflects annual depletion of well construction costs based on the recoverable gas reserves under all of the leases of Canadian River Gas Company. The company used the same method in its determination of annual and accrued depletion. Under this method the Mcf. unit cost of depletion increases with the construction costs of each new well added to the depletable base.

"The Division of Gas Engineering in the alternative method proposes that annual and accrued depletion of well intangible construction costs be depleted on the basis of recoverable gas reserves under the producing gas wells as of the beginning of each accounting period. Under this method the Mcf. unit cost of depletion tends to remain more nearly constant. Schedule No. 4, Column 4, shows the annual and accrued depletion resulting from the alternative method of computing depletion of well intangible costs.

"The alternative method, as computed in Schedule No. 3, results in total annual depletion in the amount of $324,884.26 as compared with $172,929.56 under the method already presented, or an increase of $151,954.70 for the period from June 1, 1928 to December 31, 1939.

"The increase of $151,954.70 in annual depletion is reflected in Schedule No. 1 in the following manner:

"Increase in 1939 operating revenue deductions	$ 13,286.48
"Decrease in earned surplus account at January 1, 1939, representing additional annual depletion from June 1, 1928 to December 31, 1938, inclusive	138,668.22
"Total	$151,954.70

"The accrued depletion at December 31, 1939, as is shown in Schedule No. 2 was increased by the amount of $151,954.70, representing the total additional annual depletion produced by the alternative method.

"The assets and other debits and liabilities and other credits at December 31, 1939, as adjusted, as stated in Schedule No. 2, and income and earned surplus for the year ended December 31, 1939, as adjusted, as stated in Schedule No. 1 represent the balances which appeared in the following reports presented by Examiner L. B. McKinstry:

"Balance sheet and supplemental data

"Income accounts and supplemental data including Examiner's reclassifications and adjustments

"Depletion of intangible well construction costs based on the recoverable gas reserves under all of the leases of Canadian River Gas Company or depletion of intangible well construction costs based on the recoverable gas reserves under the producing gas wells each have merit and either will provide a reserve at the expiration of the gas reserves sufficient to retire the related investment.

"The principal difference is that the depletion of intangible well construction costs based on the recoverable gas reserves under the producing wells provides a larger reserve as of December 31, 1939 and will provide larger annual amounts for the next several years, depending upon the company's drilling program. Additional expenditures of approximately $1,000,000 would be required before either method would produce the same amount of annual depletion. The alternative method will meet the requirements

of accepted accounting practice and is also being presented to the Commission for its consideration in these proceedings."

Q. You have completed your statement, Mr. Luttring?

A. I have.

Q. Turn back to it again, in order that it may be more complete and tied in with the other exhibit referred to, on Page 1 of the written statement at the bottom, the last paragraph on the page, the exhibit reads: "The exhibit already presented on annual and accrued depletion and depreciation * * *" that is Exhibit 176 heretofore presented in evidence, was prepared by Mr. Kenneth L. Smith and yourself, isn't that correct?

A. Yes, sir.

Q. Turn to the last page of the written statement. At the top of the page where you refer to the balance sheet and supplemental data, that is Exhibit No. 169 heretofore presented in evidence in these proceedings?

A. That is correct.

Q. And the income accounts and supplemental data including Examiner's reclassifications and adjustments have been presented here as Exhibit No. 168?

A. That is correct.

Mr. Lange: That is all for the present.

Cross Examination.

By Mr. Spencer:

Q. Now, Mr. Luttring, turning to your written statement here, the first sentence on the first page, in it you state that what you have done here is to give effect to depletion of well construction costs as determined in accordance with the alternative method proposed by the Division of Gas Engineering.

A. That is correct.

Q. Your Exhibit 176, I assume, was the first method that you employed for this purpose?

A. That is right, and that method is very similar to the one that the company is now using.

Q. Yes.

Mr. Lange: The one set up in Exhibit No. 176?

The Witness: That is correct.

By Mr. Spencer:

Q. Before I go any further, the principal difference here is in the one case we are depleting against total recoverable reserves, and in the other case we are depleting against recoverable gas allocable to producing wells?

A. That is correct. In Exhibit 190, of which we are talking about here, you have depletion on a basis of reserves which are in place under the existing wells.

Q. Now, the first method that you used in Exhibit 176 was a method that was also proposed by the Division of Gas Engineering, I assume?

A. No, sir.

Q. They did not propose that method?

A. No, sir.

Q. Where did you get that method?

A. The method, as I explained in Exhibit 176, you might say was identical to the one which the company is now using. The only difference was the amount of reserves which we used in our calculations.

Q. Did you adopt that method in Exhibit 176 because it had been followed by the company or for some other reason?

A. Principally because the company was using it.

Q. Is it a method that is generally practiced by gas companies?

A. Yes, the basic factors used in it are quite similar to all methods of that form of depletion.

Q. When you used your first method which follows very closely what the company is now using, you did that based wholly upon your own judgment?

A. Yes.

Q. You received no instructions to do that from anyone?

A. No, sir.

Q. Now, in this case you have presented an exhibit here to carry out an alternative method which has been proposed by the Division of Gas Engineering?

A. That is correct.

Mr. Spencer: Now, I don't want to get ahead of the story here, but is this method to be supported by the Division of Gas Engineering or do I get it from the witness on cross examination, or how is it to be handled?

Mr. March: Let the witness explain it.

Mr. Spencer: All right.

The Witness: We can only go this far, that the gas reserves that were used under the existing wells at December 31, 1939, that information was furnished to us by the Division of Gas Engineering. The reserves that were under the existing wells at the dates ending December 31st for the years prior to December 31, 1939, were also supplied to us by the Division of Gas Engineering.

Mr. Lange: They will be here ready to support that?

The Witness: I think that has already been introduced in Exhibit 181 by Mr. Stevens.

Mr. March: That is the reserves of the well and the others are the reserves on leases, that exhibit being prepared by Mr. Hammer. As far as the reserve figures are concerned, they were furnished to the accountants, the reserves under wells and the reserves under leases. They just used those reserve figures, but their application is their own—

Mr. Spencer: Quit testifying, Mr. March.

Mr. March: Is that correct, Mr. Luttring?

The Witness: Yes, that is correct.

Mr. Spencer: All I wanted to know was where to go and get the facts. That may be right, Mr. Luttring.

Q. I can get all of my facts and data from Mr. Stevens' Exhibit 181 that I need to check the computations which you made in Exhibit 190, is that correct?

A. That is correct. They would either come out of Exhibit 181, or his working papers.

Q. Mr. Stevens has let me have his working papers and we will try to check the figures from what we have.

What working papers do you have, Mr. Luttring?

A. The working papers which I have would be exactly similar to this Exhibit 190.

Q. Do you mean you would hand me a copy of Exhibit 190 for your working papers?

A. It would be a rough draft of this particular exhibit.

Q. I won't go into the particulars of your calculations at this time, Mr. Luttring, until we have checked with Mr.

Stevens' Exhibit No. 181 and his working papers to see if we have the necessary data upon which to check it. However, I do have a few general questions I would like to ask you.

At whose request did you make this particular exhibit?

A. I can't tell specifically. I do have some letters in the files that originated with the Bureau of Gas Engineering of the Federal Power Commission. Possibly Mr. Stevens would be able to enlighten you specifically on that matter.

Q. Well, for the moment I am interested in this: This is purely with reference to your functions in the matter: You have already prepared an exhibit here which contains a specific method for computing depletion and that method and your computations have been carried into a great many other exhibits which follow. I am wondering why the alternative method at this time—I wonder if you were dissatisfied with the method you used in the first instance and thought something else should be done about it.

A. No, we were not dissatisfied with the depletion as computed under Exhibit No. 176. In the first place we wanted to complete our schedule and at that time I don't think this information was quite available.

Mr. March: May I ask a question there, Mr. Spencer?

Mr. Spencer: Surely.

Mr. March: As a matter of fact, Mr. Luttring, it was determined by your superiors that both methods would be used and the Commission would be given the benefit of both calculations and they could choose which one they wanted?

The Witness: I think that is correct.

Mr. March: Doesn't that clear it up?

Mr. Spencer: I think so.

Q. You had no function here except to mechanically carry out something that was handed to you?

A. That is correct. As I say, it originated—

Q. You exercised no judgment—you didn't initiate any judgment in carrying out a policy or program outlined by someone else?

A. Only to this extent, that we did feel that this particular method was practical from an accounting standpoint.

Q. You placed your approval on it from an accounting standpoint?

A. That is correct.

Q. Does the Bureau of Internal Revenue recognize this particular method for the purpose of computing income taxes?

A. I am sure they do.

Q. Do they?

A. That I don't know.

Q. On the second line, Page 1 of your written statement, Exhibit 190, you refer to the balance sheet of the company at December 31, 1939. I assume that balance sheet is after the multitudinous adjustments that have been made in it by the Commission, or is that per company books?

A. The balance sheet would be as adjusted and as shown in Exhibit No. 169 is our starting point. Exhibit No. 169—

Q. That is the balance sheet you are using as a starting point?

A. Yes, sir.

Q. All right, I have that. That is as adjusted, is it not?

A. That is as adjusted.

Q. That is all I need on that.

The first paragraph commencing on Page 2 of your written statement, the second sentence, states: "Under this method the Mcf. unit cost for depletion tends to remain more nearly constant." That is correct?

A. That is correct.

Q. That is your statement, is it not?

A. That is correct.

Q. Are you intending thereby to place your stamp of approval on the method?

A. No, I am merely stating a fact.

Q. Are you intending thereby to express any preference between methods?

A. No, sir, I have not.

Q. Have you any preference as between the two methods?

A. I would have if I had to make a choice.

The Trial Examiner: Mr. Luttring, that is just what the Examiner is going to be faced with and I would very much appreciate your expression as an accountant as to which method you feel is a preferable one.

Mr. March: Only with this observation: Of course this observation—we don't object to the asking of questions of this witness but it does involve some engineering matters. For example, here is the thing involved. You have a lease and some wells on the lease. The difference here is in one case he has depleted the reserves under leases, and in the other case the reserves under wells. It brings in an engineering question as to whether or not the present reserves could be depleted by those present wells. We don't object to him answering the question as long as there is no engineering matter in there. That is the whole heart of the thing. It really comes down to the engineering proposition as to whether or not the user is depleting the wells over a period of years. You are going to do it by the reserves under the wells or the reserves under leases. It is well known that it is an engineering question as to whether or not present wells could draw all of that gas out of those leases and we are depleting wells here; we are not depleting leases, and so there you are. It does bring in the basic engineering question but we don't have any objection to this witness answering this thing from an accounting standpoint with that observation.

Mr. Spencer: I am not going to ask him any engineering questions and I am not going to ask him to commit the Commission, which he wouldn't do in any event. I am merely asking him as an accountant whether he has a personal opinion—

Mr. March: You mean preference.

Mr. Spencer: A personal preference between the two methods, and I believe he said that he did have a choice.

The Witness: I would prefer using the alternative method.

By Mr. Spencer:

Q. The method in Exhibit 190?

A. Yes, for the reason that the expenses from year to year would be slightly more accurate.

Q. Well, you mean they would be more constant or more stabilized?

A. That is right.

Commission Witness Stevens testified on cross-examination and redirect examination: (Vol. LXIII, pp. 9016-9042.)

Q. Do you have a copy of Exhibit 190 there, Mr. Stevens?

A. 190?

Q. Yes.

A. No, sir, I don't.

(The document referred to was passed to the witness.)

The Witness: Schedule 5, I believe it is, Mr. Spencer is that right?

By Mr. Spencer:

Q. Yes, that's right. Now, Mr. Stevens, in his written statement regarding Exhibit 190, Mr. Luttring said:

"The purpose of this supplementary report is to reflect in the balance sheet at December 31, 1939, and income and earned surplus account of Canadian River Gas Company for the year ended that date, the effect of depletion of well construction costs as determined in accordance with the alternative method proposed by the Division of Gas Engineering."

Is he referring there to your proposal?

A. Yes.

Q. Now, was your proposal made in writing of some character?

A. I don't recall. Except to state these figures shown in Column 2 on Schedule 5. Mr. Luttring could perhaps answer that point a little more accurately.

Q. But I must ask you what your proposal was, Mr. Stevens.

A. I didn't write any letter, if that answers your question more specifically.

Q. Well, what did you propose?

A. Simply these figures as representing the gas reserves—recoverable gas reserves in place at the ends of those years, that is all.

Q. That means you merely supplied data?

A. That is the fact of the case.

Q. Well, then, is it true to say that you made no proposal to the accounting department of the Commission?

A. Verbally I believe—

Mr. Spencer: I don't want to follow this thing around if we can get somebody to say when it was done and why it was done.

Mr. March: He is going to answer.

The Witness: Before we came out here to Denver this figure was requested—I say "figure"—in its multiple aspects, reserves as of the ends of various years, and we supplied that.

By Mr. Spencer:

Q. The figure was requested by whom, Mr. Stevens?
A. I don't know who made the original request.
Q. What department?

Mr. March: I will state this for the record so there won't be any difficulty. All requests of the Federal Power Commission as far as divisions are concerned come through the Bureau Chiefs. Now, Mr. Stevens was given an assignment. He was given this assignment to prepare this exhibit to show what the remaining gas reserves—or the remaining gas you would get out using just the present wells. We will stipulate to that as far as that goes.

By Mr. Spencer:

Q. Well, who made the proposal referred to here as having been made by the Division of Gas Engineering to suggest an alternative method of figuring depletion on intangible well costs?

The Trial Examiner: Mr. Stevens just testified that that was his proposal.

Mr. Spencer: That is one of the first questions he answered in the affirmative.

Mr. March: He furnished the figures, Mr. Examiner.

The Trial Examiner: Perhaps he wants to change the answer, but that is the answer he made.

Mr. March: He said he furnished the proposal in so far as he furnished the data. He furnished just the data.

The Trial Examiner: Maybe he misunderstood Mr. Spencer's question, but that isn't what he said.

The Witness:- I think the interpretation of the word "proposal" at the instant it was mentioned, our interpretations may not have been exactly the same: I have nothing to hold back on this. I would like to state an exact answer to your question but the fact is that this request for these reserves as of these years came through, I suppose, approximately the channel that Mr. March stated.

Now, as to having a part of the proposal, I recall that we were—several of us, including Mr. Luttring and Mr. Hammer and myself, discussing the use of these figures and the element of proposal was rather minor, Mr. Spencer. We thought that this reserve figure as calculated here for the various years back to 1928 was a reasonable figure in terms of this kind of an exhibit. I am not an accountant myself and it was not made up from any accounting standpoint. It was simply stated as what we considered to be a reasonable way to do it and in so stating there was no competition, you might call it, between the accountants and us as to what should be used or what had to be used. It was merely a suggestion more than a proposal, and they worked up this exhibit incorporating those figures and that is the extent of the proposal. It was more a suggestion and discussion rather than a strong proposal. It certainly wasn't a strong proposal. It was simply our idea of one way to do this.

By Mr. Spencer:

Q. Well, you didn't propose to Mr. Luttring or anybody in the accounting department to go ahead and us this data for the purpose of compiling Exhibit 190?

A. Well, in the sense that a suggestion is a proposal, it is a proposal as he states. It hinges apparently around the exact definition here of the word "proposal." I believe that states the facts of the case as much as I know them.

Q. Well, maybe they will become more apparent as we go along, what I have in mind.

About when did you receive your request or your instructions to compile these figures that have been used in Exhibit 190?

A. I don't recall that date. I believe it was in August or September. I am not sure.

Q. Of last year?

A. Yes, 1940.

Q. That was prior to the time that you had prepared Exhibit No. 182, your exhibit?

A. No, that wasn't prior to the time that that was completed. As I recall, the Exhibit 182 was completed just prior to supplying the accountants with these figures. They are more or less the conclusion of Exhibit 182, and the completion of these occurred approximately at the same time. I know that Exhibit 182 had not been done long.

Q. Now turning to Page 5 of Exhibit No. 190 which is sheet 2 of 2, Schedule No. 3, there are five columns in the schedule at the top of that page. Will you point out the schedule, or the column that contains data furnished by you?

A. It should be explained I think here at this point that where we considered reserves as of the end of one year, Mr. Luttring apparently has used that same reserve as being the beginning of the following year which is the same thing.

Q. May I stop you there? I mean, as I understood it over here, you calculated reserves in the middle of the year—

A. The figures were as of the ends of years, Mr. Spencer.

Q. These figures over here in 190?

A. Yes. You see that 2238 at the bottom of Column 2?

Q. Sir?

A. You see the 2238 at the bottom of Column 2?

Q. Yes.

A. That is the gas reserves as of 1940. He means the beginning of 1940 and I stated it as of the end of 1939. That is the point I just mentioned. Look on the last page of my written statement.

Q. I am trying to tie that statement into Exhibit 182.

A. You will see on the last page of my written statement, Mr. Spencer, not the tabulation, just the last typewritten page.

Mr. Lange: Of your Exhibit 182?

The Witness: 182, yes.

Mr. Spencer: Yes.

The Witness: See that 2238 as being the reserve?

By Mr. Spencer:

Q. That's right, I see.

A. The difference is that he calls it the beginning of 1940, which as I said, is the same thing.

Q. Yes, I understand that. Now, go ahead with the designation by columns of data that you furnished for this schedule, Page 5, Exhibit 190.

A. At this point it is necessary to make another explanation. You see the figure for the beginning of 1939 of 2,285,632,410,000?

Q. Yes.

A. That is the reserve as of the beginning of 1939 inclusive of production figures I actually supplied him excluding production. That is the difference between the figures I supplied Mr. Luttring and the ones he shows here. It is necessary to make that explanation and involves the point of view of the accountants as to whatever they used it for, which was depreciation, I believe.

Q. Depletion?

A. As I understand it, the reason it was necessary to divide this into money before production was taken out was in order to determine the rate of per Mcf, which was shown in Column 5. That is the character of this work that made it desirable to do that; and that is the only point of difference between the figures I actually gave him and the figures he uses here.

It is further stated that these figures are based on the figures that I did actually supply.

Q. Well, you haven't quite answered my question, Mr. Stevens, as you got off on another explanation. What you did furnish for Mr. Luttring on Page 5 of Exhibit 190, his exhibit, was the gas reserves shown in Column 2 with the explanation that you have made?

A. With the explanation I have made. I might make it a bit simpler by saying this: The figures Mr. Luttring shows in Column 2 are the ones I gave him but including production for the year in question and that is the difference.

Q. You also furnished him, I take it, with the annual production figures in Column 3?

A. I don't recall whether we did or not. Did he say so?

Mr. Spencer: May Mr. Luttring answer that question from where he is?

Mr. March: Just a moment. There is a way to do this.

This witness can tell, Mr. Examiner, every figure he furnished here, but as to tell how and why Mr. Luttring uses these figures, that is Mr. Luttring's obligation.

Mr. Spencer: I haven't asked him how they were used. I am asking him what was furnished.

The Trial Examiner: He hasn't been asked how.

The Witness: That can be stated very simply. It is the reserve figures for the end of the year 1939 backwards to 1928 to which he added production for the years in question to arrive at the figures shown in Column 2 for the reason explained; and if that reason isn't explained enough I think Mr. Luttring can explain that better because he is an accountant.

By Mr. Spencer:

Q. It is perfectly clear to me, Mr. Stevens. There is no complication about it except in Mr. March's mind. I am clear on it. All I want to know is, did you furnish any production figures or did Mr. Luttring get them some place else?

A. I don't recall whether he did or did not, or whether that was supplied by the Denver office.

Q. Have you figures in your working papers you could spot check to see whether they agree with your production figures?

A. Yes.

Mr. Lange: Mr. Spencer, you are referring to the figures in Column 3, Page 5, Exhibit 190?

Mr. Spencer: Yes.

Mr. March: Did he testify he didn't furnish the figures?

The Trial Eaxminer: He is testifying that he is trying to find out.

The Witness: I have them here, Mr. Spencer.

By Mr. Spencer:

Q. Don't check them all. Just spot them.

A. I am doing that So far they do check.

Yes, they are the same and it is possible that we supplied them, although I am not sure on that point.

Q. I think you did but it doesn't make any difference particularly.

Now, Mr. Stevens, correct me if I am wrong, but I understood from your cross examination by Mr. Keffer that through the calculations and computations made in your Exhibit 182 you arrived at a reserve figure for the end of 1939, did you not?

A. Yes, sir.

Q. And that figure is what?

A. 2,238,849,016.

Q. Which is shown here as you have explained it as being at the beginning of 1940?

A. He has so designated it.

Q. Now, in arriving at your reserve for prior years, as I understand it you figured backwards from your 1939 figure?

A. Yes.

Q. Tell me how you did that, just generally. Make it as simple as you can.

A. Well, I believe that if I read this statement which consists of a few notes of consecutive calculations that it would clarify it probably better than picking my way back out. Is that satisfactory?

Q. Go ahead.

A. Method of calculation of future expectancy for December 31st of any given year—1929 is used as an example.

The Trial Examiner: 1929?

The Witness: 1929. We could have used 1939. You can look at it going ahead or looking backwards in time in figuring it out.

1939 is the year I started. It is possible, however, in this note—I say it is possible because it was a reverse of the preceding discussion, but starting with 1939, if that makes it simpler, it is also possible to use the expectancy of 12-31-39 as a starting point to work back to 1928 by years by reversing the procedure that would be followed if they were calculated from 1928 forward.

Adopting the reverse procedure, all columns are avail-

able as basic data except Columns 7 and 8 and Column 7 and 8 on—

Mr. Spencer: Wait a minute, Mr. Stevens. Let's identify the columns you are talking about.

The Witness: They are not anything you have there. It is my working sheet. I was going to name them, except the expectancy of the start of the year including production of all wells—I believe that is the only thing it does not include.

We have the expectancy of 12-31-39 of 2,238,849,016 cubic feet. Now the production for 1939 of all wells is then added because to get back to the beginning of 1939 it is necessary to add the production of 1939. That production, to simplify the description can be considered as negative expectancy or expectancy that has been used up in the form of production.

By Mr. Spencer:

Q. I thought we were going backward instead of forwards.

A. Yes. By adding production you get back to the expectancy it was at the beginning of the year.

Q. Go ahead.

A. And that comes to the figure of 2,285,632,410,000 cubic feet. That, you see, is a figure that Mr. Luttring uses. The difference between my figures and his is that he includes that production and considers the expectancy to have been brought in at the beginning of the year and to serve as a basis for calculations of the latter part in the columns in his Schedule 5.

From this figure we must subtract the expectancy of the five wells that were drilled in 1939 to get back into the previous year for the reason that at a certain point those wells that were drilled had no expectancy whatever.

We must also subtract their production. This figure amounts to 123,479,112,000 cubic feet.

Q. What does that make for the well, approximately? Is that your same 24 billion figure, approximately?

A. 124?

Q. I asked you what the average was per well. Then I asked you if that was the same 24 billion used for adding wells in 1940.

A. That is right. These expectancy figures, the calculations you will note in all cases with regard to previous years, the expectancy figure calculations start as of 1939 and that average is used to go backwards in this case.

Q. The same average throughout?

A. Yes, because it is all as of the date of 12-31-39.

By the way, it isn't 24. At the end of 12-31-39 it is 23 something. It is 23,817,543,000. At the end of 1939 the average expectancy is, of course, less than at the middle of 1939 and that is the figure. In that case it represents one well. I don't recall the figures as appearing in the record at all.

Q. You gave me a figure of 123 billion that you deducted for five wells in order to arrive at the figure at the first of the year that you are talking about, which would make it, if my calculation is correct, 24 billion instead of 23 billion. It is relatively unimportant—

A. This is 23,817,000,000. It is almost 24 billion, Mr. Spencer.

Q. All right.

A. Unless you figured it out exactly, that perhaps accounts for the difference. There is almost 24 billion.

Q. Five divided into 123 must go at least 24 times. Isn't that correct?

A. I see what you mean. That figure there is the expectancy and the start of its life with respect to five wells only and includes the 5 times 23815 plus whatever it produced.

We were up to the point of subtracting the expectancy and production of the five wells. That gets us back to the expectancy as of 12-31-38 of the wells producing at that date, which is not excluded in the five wells brought in in 1939 both as to their expectancy and their own production.

This reversed procedure can be continued back to the end or to the beginning of the early years, earlier years such as 1928. It would have been easier to have considered this from 1928, Mr. Spencer, in spite of the fact that the original

start was in 1939. However, you can work it from either direction. I think it makes a more comprehensive picture to start in 1928.

Q. Can it be done briefly the other way?

A. Yes, sir.

Q. All right, reverse it and put it in the other way, if the Examiner has no objection.

The Trial Examiner: No. However, I don't seem to follow him on this procedure he is going through now. It is probably clear if one would read it in the record. If it can be made plainer, Mr. Stevens, by reversing it, do so.

The Witness: I think it can. I think it can be better understood by most people a little better by starting in 1928, although I do start with a 1939 figure, to calculate back from there. You can start at the front and you can start at the back.

The Trial Examiner: Perhaps we might give you a few minutes to thrash it over.

We will stand in recess for five minutes.

(At this point a short recess was taken, after which proceedings were resumed as follows:)

The Trial Examiner: The hearing will be in order.

By Mr. Spencer:

Q. Now, Mr. Stevens, suppose we adopt your suggestion and put into the record an explanation of the method you utilized in figuring gas reserves as shown in Column 2, Page 5 of Mr. Luttring's Exhibit 190 by reversing the process.

A. The method of calculation of future expectancy for December 31st of any given year—the year 1929 is used in the example. The figures are in Mcf. on a 16.65 base. The term "expectancy" or "future expectancy" is synonymous with gas reserves recoverable by present wells for the years in question and is used for reasons of brevity and simplicity.

First, the expectancy of all wells as of 12-31-39 is 2,239,849,016 Mcf., or 23.817543 billion for the average of 94 wells. That is as of the date of 12-31-39. This figure was derived from projection of pressure versus accumulative production

curve to intersect with an assumed 25-pound abandonment pressure and represents the gas reserves recoverable by Canadian River Gas Company as of 12-31-39.

The expectancy of the nine wells having first production in 1929 was obtained by multiplying the average well expectancy of 23,817543 Mcf. by 9, obtaining 214,357,887,000 Mcf. as of 12-31-39. To the expectancy as of 12-31-39 and to this expectancy of 4-12-39 is added the entire life of the production of the nine wells from the beginning of 1929. If it were shown by example from 1928 it would be the 35 wells as of 1928 but we are talking about 1929 in which nine wells were added. This amount is 30,876,429 Mcf.

The addition referred to gives 245,234,316 Mcf.

Q. In what year?

A. What this does is it has the effect of bringing the total expectancy of the nine wells back to the start of their lives which is at the beginning of 1929. It gets them to the instant which they were drilled in or assumed to be drilled in at the start of that year.

As the beginning of 1929 is considered the end of 1928, the expectancy at the first of 1929 of wells drilled in that area is added to the expectancy of other wells in existence at the first of 1929; that is, to the expectancy of other wells at the end of 1928.

Thus 245,234,316 Mcf. plus 1,029,892,131 Mcf. equals 1,275,126,447,000 Mcf. This figure includes production for the year in question and can be considered as the expectancy at the start of the year. The production that is included consists of production naturally for the nine wells drilled in 1929 as the entire life production was added previously, and the years production for the 35 wells already producing in 1928.

Therefore, to arrive at the expectancy for 12-31-29 it is necessary to subtract the production for 1929 of the 44 wells then involved. The production of 19,100,446 Mcf. is subtracted, giving 1,256,025,999 Mcf. This is the expectancy of the 44 wells producing at 12-31-39. The basic principle of the method used is started from 1928 to give yearly addition of wells, their proper contribution to expectancy. This expectancy is, of course, reduced by production.

The basic plan further considers addition of bands of wells for sucessive years and if this problem is considered as addition of successive bands of years and the expectancy of wells drilled in in those years followed by subtraction of the production of all wells operating at the end of those years, such operations arriving at an expectancy for the wells in existence at the end of those years.

Mr. Spencer: Is that clear to the Examiner?

The Trial Examiner: I think I can follow it in the record, as I have before.

By Mr. Spencer:

Q. Now, Mr. Stevens, you started out with 35 wells in 1928 and ended up with 94 wells in 1939, isn't that correct?

A. Yes, sir.

Q. In order that we may make our calculations, I wish you would from your working papers give the number of wells involved by years as you have used them.

A. 1928, 35; 1929, 44; 1930, 57; 1931, 65; 1932, 66; 1933, 71; 1934, 71, there being no additions in 1934; 1935, 74; 1936, 82; 1937, 86; 1938, 89; 1939, 94.

Q. Your list of wells contains wells that the company acquired by purchase rather than drilled, I assume you treated them no differently than you did those that were drilled by the company?

A. Well, these numbers of wells are the numbers of wells producing as of the end of those years when owned by Canadian River and when they are owned by Canadian River, of course, their expectancy is owned by the Canadian River. I believe that answers your question.

Q. Well, I think it does. You have made no distinction in your formula or method you have described here as between wells drilled by the company and wells acquired by the company but drilled by third parties?

A. Not when they were under Canadian River ownership. Then they were Canadian River wells, and no differential was made between those owned by Canadian River and their expectancy was owned by Canadian River.

Q. You didn't take into consideration production which might have come from those wells during their prior ownership, is that correct?

A. During their prior ownership their production didn't show up in your production and hence they are excluded for that reason.

Mr. Spencer: May I talk to the witness off the record a bit? There is no use of involving the record here.

The Trial Examiner: Yes. Off the record.

(Discussion outside the record.)

The Trial Examiner: On the record.

By Mr. Spencer:

Q. Now, Mr. Stevens, I take it from your testimony that you are an engineer by profession, is that right?

A. Yes.

Q. Have you ever made any particular studies or had any particular experience in determining proper rates of depreciation or depreciation for properties of oil and gas companies.

A. No.

Q. And is the same answer applicable to depletion?

A. Yes.

Q. Am I correct in stating that you are not recommending the treatment given to the data furnished by you in Mr. Luttring's Exhibit 190?

A. Well, that is a bit difficult to answer. Under your term "recommending," I believe that is a logical way to do but from an engineering point of view I suppose that the equipment in a gas well is used as long as the gas is there that is going to be recovered from those wells. Beyond that point of thinking that it is a logical thing to do, my recommendation probably has no value as such for the reason that be ond that point accounting features enter in upon which I don't feel competent to testify. It is simply a logical method and that is the extent of the recommended value that the tabulation may have.

Q. What Mr. Luttring has done, you did not recommend him to do?

A. I don't recall recommending that he make that specific report. The recommendations as far as they are recommendations were a statement of principle that we had some confidence in as being equitable in terms of a physical gas

property. That is really the sum and substance of the degree of recommendation.

Q. After all, a matter of depreciation and depletion is largely a question of amortizing your investment and getting it back at the proper time, is that correct?

A. That is my understanding.

Q. What part would you think that business judgment of the management might play in determining those questions?

A. I gave no consideration to that. I don't know whose business management or judgment is involved in that. The point of view given in these figures is irrespective of anything but what you might call physiologic. It incorporates no point of view of the management or accountants.

Q. I think that is right. You admit, however, that the question is not an academic one?

A. Not in its application.

Q. Who determined, if you know, that the reserve figures you furnished here should be applied to intangible wells cost?

A. I don't know specifically.

Q. Do you know why it was not applied to leaseholds, for instance.

A. This figure for reserves?

Q. Yes, in determining the rates for that.

A. The general reason is that it is clear it is not the lease reserve because some other figure is incorporated in Mr. Hammer's reserve as the figure for lease reserve.

Q. But still if this is all you are going to get out of present wells you would be wanting to get it out and get your money back on your leaseholds?

A. That isn't considered to be the fact, this being the reserve under wells, and the lease reserve being the total under leases to be recovered.

Q. You still have to get your money back through whatever wells you have, isn't that right?

A. Yes.

Q. Let me ask you this. You have made your calculation of reserves here as of 1939?

A. Yes, sir.

Q. Had you made that calculation for any of the pre-

ceding years down to 1928, the rate that Mr. Luttring arrived at would be changed, would it not?

A. Had we made it to some early date?

Q. Any date prior to this. You would have come out with a different rate, wouldn't you?

A. Whatever the reserve showed would have influenced the rate, I suppose. You are referring to Column 5 there. I suppose it would have its effect, however, they were made as of 1939, which is the present estimate.

Q. If we make it any date in the future, undoubtedly there would be some change in the rate, is that not right?

A. I am not thoroughly familiar with Mr. Luttring's procedure there and I would hesitate to answer affirmatively on that.

Q. Confine it to your reserves for the purpose of determining rate.

A. That is what he used—do I misunderstand you—

Q. I will shortcut.

You can use your method here in making your calculation for any year in the past and undoubtedly for any year in the future and find different reserves upon which to base your depletion computation, is that not correct?

A. This reserve is for present wells, of course, and those calculations are, I suppose, on present wells since they are on this figure.

Q. That is right.

A. As to what he would do in the calculation or in the application of any future reserve changed from our curve or staying on our curve, I don't know what he would do in that case, Mr. Spencer.

Q. He has stayed with your figure, hasn't he? He hasn't made any adjustment in your figures except the ones that you mentioned.

A. No, but they are as of 1939 and we are talking about the future, I believe.

Q. Yes, that is right. I won't go any further with that.

You say you have made no particular study of the depreciation and depletion and what a corporation should do with that?

A. No, sir.

Mr. Spencer: That is all.

The Trial Examiner: Do you have some redirect, Mr. March?

Mr. March: Yes.

Redirect Examination.

By Mr. March:

Q. Mr. Stevens, which one of these methods do you prefer for depleting the wells over the life of the wells or the life of the leases?

Mr. Spencer: Mr. Examiner, let us have him qualify the witness first. When I left him he wasn't qualified.

Mr. March: I asked him which one he preferred and that is all that is necessary for him to answer, if he has an opinion.

The Trial Examiner: I believe he just stated in response to cross examination, Mr. March, that he had made no study of the property depreciation and depletion other than that this system he proposes would be the logical method to use.

Mr. March: I want to know why he thinks it is the logical method.

The Trial Examiner: Is that what you want to know?

Mr. March: Yes.

The Trial Examiner: All right.

By Mr. March:

Q. Which one of the methods do you prefer and why?

A. Personally, I prefer this one described here as far as preference has any significance. Of course, it seemed that it was the logical one because it was tied in intimately with the life of the well or the use of the well—is tied in logically with the period of use and that is really the fundamental and probably the only basis of preference that the depletion is tied in with, the amount of gas that is going to be depleted. That seemed the very logical thing to me and that is probably the only and main reason for the preference.

Q. Your position is that you are depleting wells and that you should have the depletion period over the life of the wells?

A. Which is the history of the recoverable reserves, which is the period of producing from the recoverable reserves of the period in question. That is stating the same thing I believe.

Exhibit 190 is, in part, as follows:

CANADIAN RIVER GAS COMPANY

CONDENSED INCOME AND EARNED SURPLUS ACCOUNT AS ADJUSTED
FOR THE YEAR ENDED DECEMBER 31, 1939
GIVING EFFECT TO ALTERNATIVE DEPLETION AS PROPOSED BY SUPPLEMENTAL ENTRY

Sheet 1 of 2

Description (1)	As Adjusted (Note 1) (2)	Examiner's Supplementary Revision (Note 2) (3)	As Alternatively Adjusted (Note 3) (4)
Utility Income			
Operating Revenues	$2,393,386.99		$2,393,386.99
Operating Revenue Deductions			
Operating expenses	$ 665,286.93		$ 665,286.93
Depreciation	153,987.13		153,987.13
Depletion	44,865.27	$ 13,286.48	58,151.75
Taxes	175,141.03		175,141.03
Nonrecurring expenses	222.60		222.60
Total Operating Revenue Deductions	$1,039,502.96	$ 13,286.48	$1,052,789.44
Net Operating Revenues	$1,353,884.03	($ 13,286.48)	$1,340,597.55
Exploration and Development Costs			
Delay rentals	$ 10,401.58		$ 10,401.58
Nonproductive well drilling	29,293.73		29,293.73
Abandoned leases	1,878.18		1,878.18
Total Exploration and Development Costs	$ 41,573.49		$ 41,573.49
Net Utility Income	$1,312,310.54	($ 13,286.48)	$1,299,024.06
Other Income			
Interest revenues	$ 17.88		$ 17.88
Miscellaneous nonoperating revenues	292.39		292.39
Total Other Income	$ 310.27		$ 310.27
Gross Income	$1,312,620.81	($ 13,286.48)	$1,299,334.33
Income Deductions			
Interest on debt to Colorado Interstate Gas Company			
Bonds	$ 327,235.00		$ 327,235.00
Notes and current account	104,962.71		104,962.71
Other interest charges	11,403.39		11,403.39
Miscellaneous income deductions	29,372.17		29,372.17
Total Income Deductions	$ 472,973.27		$ 472,973.27

CANADIAN RIVER GAS COMPANY
CONDENSED INCOME AND EARNED SURPLUS ACCOUNT AS ADJUSTED
FOR THE YEAR ENDED DECEMBER 31, 1939
GIVING EFFECT TO ALTERNATIVE DEPLETION AS PROPOSED BY SUPPLEMENTAL ENTRY

Notes:

(General) This supplementary statement of Respondent's income and earned surplus account for the year ended December 31, 1939, embraces the income and earned surplus account as adjusted and presented in the accounting report "Income Accounts and Supplemental Data Including Examiner's Reclassifications and Adjustments", and after giving effect to an alternative computation of annual depletion of gas well intangible costs, differing from the computation of annual depletion as made for the income and surplus account as first adjusted.

(1) The figures in this column are taken from column 9 of Statement B 1 of the report entitled "Income Accounts and Supplemental Data Including Examiner's Reclassifications and Adjustments and represent the Condensed Income and Earned Surplus Account for 1939 as adjusted.

(2) Basis of revision of annual depletion of gas well intangible costs for the year 1939 is as follows:

Depletion, per entry on Schedule No. 3 hereof	$39,625.53
Depletion, per entry 406 of report entitled "Annual and Accrued Depletion and Depreciation of Gas Plant Accounts and Examiner's Adjustments"	26,339.05
Additional depletion for the year 1939 on alternative basis	$13,286.48

(3) Although the Examiner's Suspensions for the Consideration of the Commission shown in Statement B 1 of the report entitled "Income Accounts and Supplemental Data Including Examiner's Reclassifications and Adjustments" are as pertinent to this schedule as they are to that statement, they have not been here repeated.

CANADIAN RIVER GAS COMPANY
BALANCE SHEET AS ADJUSTED, DECEMBER 31, 1939
GIVING EFFECT TO ALTERNATIVE DEPLETION
AS PROPOSED BY SUPPLEMENTAL ENTRY

Assets and Other Debits (1)	As Adjusted (Note 1) (2)	Liabilities and Other Credits (3)	As Adjusted (Note 1) (4)	Examiner's Supplementary Revision (Note 2) (5)	As Alternatively Adjusted (6)
Utility Plant:		Capital Stock - Common capital stock

1938	2,204,636,366	42,483,068	36,153.09	.000851
1939	2,285,632,410	46,783,394	39,625.53	.000847
1940	2,238,849,016			
Totals	x x x x	355,648,958	$324,884.26	$ .000913

All MCF data above are stated on a pressure base of 14.65 pounds per square inch absolute.

Gas reserves shown in column 2 represent remaining gas reserves under the existing wells as of the beginning of each accounting period. All amounts in column 2 were derived by adding the annual production to the remaining gas reserves under the producing existing wells at the end of each accounting period.

Net Book Cost - Gas Plant in Service	$ 8,011,775.08	$3,337,026.22	$1,895,283.97	$1,441,742.25	$4,671,066.53	$3,692.33

Exhibit No. 196

50129

The testimony with respect to salvage is also abstracted under Title 27 supra as to Colorado Interstate's salvage. As shown in Exhibit 281, WITNESSES TAUBMAN, SMITH and SOLOW, the salvage value as of January 1, 1956, of Canadian's property is stated to be $198,384.69.

61. **Rate of Return.**

Under title 28 supra the evidence on rate of return submitted by WITNESSES COFFMAN, Exhibit 73, GILMAN, Exhibit 74, SANDS, Exhibit 92, and BOSWORTH, Exhibit 93, for Canadian and Colorado Interstate, and KNAPP, Exhibits 225 and 225-A, for the Commission, is abstracted.

62. **Company's Statement as to Revenue Required to be Received by Canadian on a Regulatory Rate Basis for all Gas Delivered Colorado Interstate at Clayton Junction in Order to Produce a Fair Return on the Fair Value of Canadian's Property.**

This is shown in Exhibit 276 (Vol. LXXXXIV, pp. 14439, et seq.), Witness Lusk.

The costs of operations of Canadian from 1939 to 1947, inclusive, are computed on a regulatory rate basis without regard to the contract between Canadian and Colorado Interstate (Exhibit 16). Such costs of operation are related to the original cost of the property owned by the company, as set forth in Exhibits 183 and 184 for production and gathering facilities, and Exhibits 67 and 133 as to Canadian's portion of the Denver Line. The costs are divided between the well mouth production system, the gathering system and the transmission system, and there is shown the portion of such costs which constitute the cost to Colorado Interstate of all gas delivered to it at Clayton Junction, New Mexico.

Lusk testified the revenue thus required, in his opinion, would provide: (a) costs arising from operating and maintaining the property, including income and all other taxes; (b) proper allowance for depletion and depreciation; and (c) a reasonable return on the fair value of the property.

Most of the costs arising from the operation and mainte-

nance of the property are directly charged to the production system, the gathering system and the transmission system. The costs which are undistributed on the company's books be divided as between the three systems pro rata with the directly charged expenses relating to each.

The costs of operations in 1939 is shown in Exhibits 91 and 163 (previously abstracted) were reduced by the amounts of certain general construction costs related to property additions made in 1939, which are included as capital charges in Exhibits 67, 133, 183 and 184, also above abstracted.

The total costs of operations are summarized on Statement 6, and their division by major operating accounts and systems is shown on Statements 7, 8 and 9.

Statement 6 is shown below in three sections:

Calendar Year (1)	Gas Expenses (A) (2)	Taxes (B) (3)	Other Expenses (E) (4)	Total Expense (5)	Less Other Revenues (F) (6)
1939	$341,959	$114,597	$451,082	$ 907,638	$177,691
1940	419,752	118,900	493,763	1,032,415	140,261
1941	380,077	124,300	492,566	996,943	151,221
1942	333,402	132,400	538,300	1,004,102	154,551
1943	366,127	138,400	560,924	1,065,451	155,522
1944	374,952	144,900	590,455	1,110,307	158,713
1945	378,377	150,600	581,849	1,110,826	161,904
1946	381,002	149,100	528,209	1,058,311	161,904
1947	390,327	133,100	323,669	847,096	161,904

Notes: (A) As shown on Statement No. 7 attached.

(B) As shown on Statement No. 10 attached.

(C) As shown on Statement No. 11 attached.

(D) As shown on Statement No. 13 attached.

(E) As shown on Statement No. 18 attached.

(F) Corresponds to total shown on Statement No. 5 attached.

(G) As shown in Column 5, Statement No. 9 attached.

(H) Includes an allowance of 8 per cent return, and depletion, depreciation and amortization of property by a sinking fund method with interest at 2¾ per cent annually.

Net Operating Expense (7)	Replacement Reserve (B) (8)	Provision for Depreciation and Depletion (B) (9)	Amount Required for 8 Per Cent Return (C) (10)	Federal Taxes (D) (11)	Total (F) (12)
$729,947	$10,614	$570,664	$ 868,233	$ 74,705	$2,254,163
892,154	10,614	570,664	909,027	137,318	2,519,777
845,722	10,614	570,664	939,262	194,658	2,560,920
849,551	10,614	570,664	968,430	229,147	2,628,406
909,929	10,614	570,664	1,010,501	279,763	2,781,471
951,594	10,614	570,664	1,029,637	337,574	2,900,083
948,922	10,614	570,664	1,042,829	401,734	2,974,763
896,407	10,614	570,664	1,056,365	520,500	3,054,550
685,192	10,614	570,664	1,070,221	780,743	3,117,434

The rate base used as of January 1, 1939, is the original cost as of December 31, 1938, less the accumulated depreciation as of said date, shown in Exhibits 272 and 273, Witness Roberts, above abstracted, plus working capital as of that date, shown in Exhibit 192, also abstracted above under that heading.

For the years after 1939 there were added, to obtain the property rate base at January 1 of each year, subsequent additions actually made in 1939, as shown in Exhibits 67 and 183, and as estimated, for subsequent years through 1947 by Exhibits 133 and 184, all of which exhibits have been abstracted above. Such property rate base, separated as between production, gathering and transmission systems, including the gasoline plant, as of January 1 of each year, 1939 to 1948, inclusive, is shown on Statement 10 as follows:

1939	$10,662,903
1940	11,157,829
1941	11,520,772
1942	11,875,372
1943	12,386,265
1944	12,605,465
1945	12,760,365
1946	12,919,565
1947	13,102,765
1948	13,135,965

Allowance was made for depletion and depreciation by the sinking fund method, whereby the annual installments, accumulated by compound interest at 2¾%, will return such depreciated original cost of the property in use on January 1, 1939, and the additions through 1947, at the end of 1956. Such period of time was based upon Exhibit 255, elsewhere abstracted, in which the respondent's witness Hendee testified the economic life of the field would cease by the end of 1956.

The rate of 2¾% interest used in connection with the sinking fund was taken from the rates shown for ten public utility AAA bonds and U. S. Treasury Bonds, as shown on Schedules 3 and 4 in Exhibit 225, Commission Witness Knapp.

An allowance was also made for the annual accumulation of funds needed for the replacement of short-lived property, such as automobiles, trucks and drilling and cleaning equipment, separate and apart from the provision made in the sinking fund requirement for depletion and depreciation. An 8% return was adopted, using as a basis Exhibits 73, 74, 92 and 93, abstracted under Title 28, "Necessary Rate of Return," supra.

Federal income taxes, at presently existing rates and without considering the possibility of increased rates in the future, were computed on the estimated earnings of the company under such regulatory rate basis.

The total gas revenues to which Canadian states it is entitled on a regulatory rate basis are summarized on Statement 5 by operating systems for the years 1939 to 1947, inclusive, and are shown below:

Year (1)	Production (2)	Transmission (3)	Gathering (4)	Total (5)
1939	$1,417,743	$255,486	$580,934	$2,254,163
1940	1,550,558	267,621	701,598	2,519,777
1941	1,565,750	269,275	725,895	2,560,920
1942	1,612,886	289,256	726,264	2,628,406
1943	1,671,724	308,999	800,748	2,781,471
1944	1,743,001	325,285	831,797	2,900,083
1945	1,773,903	340,193	860,667	2,974,763
1946	1,805,776	355,701	893,073	3,054,550
1947	1,806,694	377,724	933,016	3,117,434

This is also shown on Statement 6 by principal operating accounts. The distribution of such costs and revenues are summarized by production, gathering and transmission systems on Statements 2, 3, and 4, supported by Statements 7 to 12, inclusive.

The agreement of January 3, 1928, between Canadian and Colorado Interstate (Exhibit 16) makes provision for the division of costs as between separate deliveries of gas which make joint use of certain facilities.

In this Exhibit 276 such methods provided in the contract are used in assigning the required revenues of the company to the deliveries of all gas at Clayton Junction. For example, the required revenues from transmission line operations are

assigned to Clayton Junction deliveries in the proportion that those deliveries bear to the total amount of gas delivered from Canadian's transmission line; the required revenues from gathering operations are assigned to Clayton Junction deliveries in the proportion that the gas gathered to make such deliveries (including a pro rata share of gas used at Bivins) bears to the total gas gathered; and the required revenues from well mouth operations are assigned to Clayton Junction deliveries in the proportion that the gas produced to make such deliveries (including the pro rata share of gas used in gathering) bears to the total well mouth production.

The percentages of production, gathering and transmission revenues chargeable to Colorado Interstate for all gas delivered at Clayton Junction as used in the exhibit are shown in the next to the last column on Statements 2, 3 and 4, and are identical with those used in the cost determination made for all gas under the basic contract terms in Exhibit 164, Statement 9, hereinabove abstracted. These percentages for the years 1939 to 1947, inclusive, shown on Statements 2, 3 and 4, for production, gathering and transmission, are as follows:

Production	Gathering	Transmission
45.36%	50.57%	97.70%
45.69	52.47	97.76
46.91	54.32	97.91
42.80	48.73	97.95
40.72	46.01	97.95
38.98	43.69	97.99
38.05	42.43	98.02
42.50	48.04	98.02
77.44	98.02	98.02

Applying these percentages to the total figures (all gas) in Statement 5 above, Statement 1 summarizes the amounts determined in the manner above described that Canadian states it is entitled to receive under a regulatory rate basis from Colorado Interstate for all gas delivered at Clayton Junction, as follows:

Year	Production	Gathering	Transmission	Total
1939	$ 643,088	$129,199	$567,573	$1,339,860
1940	708,450	140,421	685,882	1,534,753
1941	734,493	146,270	710,724	1,591,487
1942	690,315	140,954	711,376	1,542,645
1943	680,726	142,170	784,333	1,607,229
1944	679,422	142,117	815,078	1,636,617
1945	674,970	144,344	843,626	1,662,940
1946	767,455	170,879	875,390	1,813,724
1947	1,399,104	370,245	914,542	2,683,891

Additional testimony of MR. LUSK in connection with this exhibit appears under title 32 supra.

63. Revenue Claimed to be Required by Canadian on a Regulatory Rate Basis for all Gas Delivered to Colorado Interstate at Clayton Junction, Except Colorado Interstate's Direct Sale Gas, in Order to Produce a Fair Return on a Fair Value of Canadian's Property.

Under the title preceding this one (Exhibit 276), the evidence is abstracted, showing Canadian's claimed required revenues under a regulatory rate basis from all gas delivered at Clayton Junction, New Mexico, to Colorado Interstate.

In this Exhibit 277 (Vol. LXXXXIV, pp. 14753, et seq.), Witness Lusk testified that if Colorado Interstate's direct sales were eliminated, the total annual costs would be lower, due to the reduced facilities and the reduced volumes of gas required.

Such lower costs were reflected in Exhibits 134 and 193, showing the equivalent original costs of Canadian's property for resale gas only; Exhibits 274 and 275, showing the accumulated depreciation as applied to such equivalent original cost, and Exhibit 165, showing the costs of operations, involving resale gas alone by Colorado Interstate. The costs of operation shown in the latter exhibit were further reduced in this Exhibit 277 by the amount of certain

general construction costs related to property additions in 1939, which were included as capital costs (Exhibits 134 and 193).

This Exhibit 277 shows the annual revenues required from all gas, except Colorado Interstate's direct sale gas, at Clayton Junction, New Mexico, determined in a manner identical with that for all gas delivered at Clayton Junction in Exhibit 276, abstracted in Title 34. The percentages of production, gathering and transmission chargeable to Colorado Interstate on Statements 2, 3 and 4 are identical with those used in the cost determination for resale gas in Exhibit 167, abstracted in Title 30.

(All of the exhibits above referred to have been abstracted above.)

Statement 1 of Exhibit 277 shows the claimed required revenues from all gas delivered to Colorado Interstate at Clayton Junction except its direct sale gas on a regulatory rate basis, for years 1939 to 1947, inclusive, as follows:

Required Revenues from Gas on a Regulatory Rate Basis (A) Resale Gas Delivered at Clayton Junction, New Mexico, to Colorado Interstate Gas Company, 1939 to 1947, Inclusive.

Year (1)	Production (B) (2)	Gathering (B) (3)	Transmission (B) (4)	Total (5)
1939	$ 399,115	$ 85,430	$566,534	$1,051,079
1940	461,301	99,940	693,264	1,254,505
1941	485,734	105,900	709,237	1,300,871
1942	454,798	100,578	714,040	1,269,416
1943	453,881	101,618	771,254	1,326,753
1944	456,048	102,175	826,520	1,384,743
1945	457,472	104,682	854,009	1,416,163
1946	536,437	128,653	880,991	1,546,081
1947	1,201,815	378,896	909,202	2,489,913

Notes: (A) Includes an allowance of 8 per cent return and depletion, depreciation and amortization of property by a sinking fund method with interest at 2¾ per cent annually.

(B) Amounts in Columns (2), (3) and (4) from Statements Nos. 2, 3 and 4 respectively.

Additional testimony of MR. LUSK in connection with this exhibit appears under title 32 supra.

---

64. Canadian's Statement of Operating Costs Under Basic Contract Terms for all Gas Delivered to Colorado Interstate at Clayton Junction Apportioned Between Resale Gas and Direct Sale Gas.

Under title 35 supra, Exhibit 316, Witness Rhodes (Vol. CII, p. 15881), is abstracted. That exhibit is entitled "Methods of Apportioning Costs of the Producing and Gathering Facilities of Canadian River Gas Company and of the Denver Line Between Resale Gas and Direct Sale Gas 1928 to 1947, Inclusive." Colorado Interstate's brief, however, dealt mainly with the Denver Line.

MR. RHODES further testified in connection with Exhibit 316 as follows:

3. Apportionment of Gas Leaseholds

Gas leaseholds are owned for the purpose of supplying the current and future market requirements of gas. The markets served and delivery points named in the order of their priority or preference, as provided by existing contracts, are:

1. To Amarillo Oil Company for its markets in Amarillo and its environs and to domestic consumers in North Texas as described in the third paragraph of the Canadian River-Colorado Interstate agreement of January 3, 1928, which is Exhibit No. 16 in this proceeding. Deliveries are presently made from the well mouth for certain of these markets and from the Denver line for Hartley, Dalhart and Texline, Texas.

2-A. To Colorado Interstate Gas Company for its customers in and near Denver, Pueblo and Colorado Springs, Colorado and others served from the Denver line as described in Paragraph Fifteenth of Colorado Interstate's agreement with Natural Gas Pipeline Company of America dated October 15, 1931 which is Exhibit No. 7-G in this proceeding. Deliveries are made to Colorado Interstate from the Denver line at Clayton Junction, New Mexico.

2-B. To Clayton Gas Company which company was originally a customer of Colorado Interstate Gas Company. Deliveries are made from the Denver line near Clayton, New Mexico.

3. To Colorado Interstate Gas Company for delivery to Natural Gas Pipeline Company of America. Deliveries are made by Canadian River Gas Company at Gray's Junction, Oklahoma. Deliveries at this point are made possible by lease and operating agreements between Canadian River Gas Company and Texoma Natural Gas Company relative to the use of transportation facilities from the Fritch compressor station of Texoma Natural Gas Company in Texas to the delivery point at Gray's Junction, Oklahoma.

The contract of October 15, 1931 with Natural Gas Pipeline Company further requires that Colorado Interstate refrain from making hereafter and consenting that Canadian River Gas Company may make hereafter any sales exclusive of those indicated above, of any gas from the gas properties of Canadian River Gas Company in quantities in excess of 18,250,000 Mcf. per year.

Notwithstanding the Denver line's priority rights in the gas supply of Canadian River over those of the Chicago line, Canadian River's acreage has been apportioned with the aggregate volumes of gas heretofore marketed and anticipated to be marketed within a reasonable period in the future. Chicago gas might appropriately have been charged for the use of leaseholds on an incremental basis whereby the base or foundation costs would have to be borne by and divided between the Denver line gas and Amarillo gas on some equitable basis.

This ratio is designated as the project volume ratio which as applied to any class of business is the ratio of the volume of gas required for that business during the period under consideration to the total volume of all classes of business during the same period. For the purpose of this study there have been taken the actual and estimated volumes produced from the begining of regular operation of the Denver line through 1947. The volumes of gas sold or required in future operations for each delivery point and class of business used in the development of the project ratios

shown on Statement No. 1, have been taken from Exhibits Nos. 78 and 80. In determining this ratio all requirements must be converted into the net amounts of gas required to be produced on account of the facts that (a) deliveries to the Denver line are made at the Bivins Station discharge (i.e., less gas used at Bivins), (b) all other sales including deliveries for the Chicago line are at the Fritch Station suction and (c) deliveries to Amarillo Oil Company for certain markets are at the well mouth. These ratios taken from the column footings of Statement No. 1 are as follows:

Resale Gas From the Denver Line:	
Local deliveries to Amarillo Oil Company and Clayton Gas Company	1.05%
Colorado Interstate Gas Company	24.85
Total Resale	25.90%
Direct Sale Gas From the Denver Line:	
Colorado Interstate Gas Company	22.23
Total Denver Line	48.13%
All Other Sales	51.87
Total Net Well Mouth Requirements	100.00%

The operating costs related to leaseholds are royalties and delay rentals. The royalties are paid pro rata with the volumes produced each year. They are properly apportioned pro rata with the net amounts of gas required to be produced each year, also shown on Statement No. 1. The delay rentals are properly apportioned on the same basis as the leaseholds.

4. Apportionment of Other Well Mouth Production Costs

The number of wells required in the development of natural gas acreage is fixed both by the maximum demands for gas to be produced and by leasehold requirements. The maximum daily production of any one of Canadian River's wells is limited by State control to 25 per cent of the daily open flow of that well. The maximum production from any lease is fixed by internal proration among leases under which

the company operates. This internal proration is based on total monthly requirements. It thus appears that the number of wells required by Canadian River is controlled both by the maximum daily demand and by the maximum monthly demand.

Canadian River's total original cost of wells and annual expenses on account of the wells (except royalties and taxes based on the volume of production) is controlled largely by the number of wells required. These costs are not affected by the volume of gas produced in any year. These costs are thus controlled by the maximum daily production and by the maximum monthly production.

The maximum daily production of Canadian River's wells on account of Denver line resale gas and Denver line direct sale gas is determined not only by the requirements of these two classes of gas on that day but by the amount of gas delivered into the Denver line for storage through building up of line pressures which is in control of the operator. The ratio of maximum daily requirements to maximum monthly requirements of resale gas is higher than such ratio related to direct sale gas and to gas for the Chicago line. In this exhibit the maximum monthly requirements are used as a basis of apportionment thus charging to resale gas less than its full share of the Company's costs.

The apportionment of Canadian River's original cost of wells and of annual expenses of well mouth production (except royalties and taxes based on volume of production) are thus appropriately apportioned as between the several classes or gas pro rata with the respective maximum monthly volumes of gas produced to meet their requirements. The ratios to be determined for any year are based upon the maximum monthly requirements during the winter in which the year begins. The independent monthly maximum for each class of gas is used and expressed in terms of a 31 day month. These maximum monthly requirements are shown both in terms of gas sold and gas produced on Statement No. 5 together with the determination of the maximum month ratios for the several classes of gas involved for each year of the project period.

The apportionment of royalties and delay rentals is de-

scribed in Section 3 above. The remaining well mouth production costs are principally controlled by the annual volume of gas handled and in general comprise gas purchased and severance taxes assessed on the basis of annual volume of production. These remaining items of cost are appropriately apportioned as between the several classes of gas pro rata with the respective annual volumes of gas produced to meet their requirements. These annual volumes expressed both in terms of gas sold and of gas produced are shown on Statement No. 1, together with the determination of the annual volume ratios for the several classes of gas for each year of the project period.

2. Apportionment of Gathering Costs

The costs of gathering gas are wholly unaffected by the volume produced each year. They are controlled by peak loads like well equipment costs. These costs, both capital and operating, are appropriately apportioned on the basis of the maximum month ratios. These ratios for gathering system costs have been developed as shown on Statement No. 6.

* * * * *

Other apportionments of pipe line capacities should not be used for the reasons outlined below:

(A) If the resale business and the direct sale business had equal primary rights to the net capacity of the line, instead of the resale gas having the first call and the direct sale gas having only what was left, then the direct sale gas would have 38.2 per cent of the net firm capacity of the line or 33,000 Mcf. per day as a primary business instead of 8,000 Mcf. per day as the secondary business, as shown above. With equal primary rights in the line then the resale gas and the direct sale gas might expect to share the costs pro rata with their quotas in the flow capacity of the line.

Since the resale gas and direct sale gas do not have equal rights in the line, equal sharing of the costs would result in a gross overcharge to the direct sale business and a gross undercharge to the resale business. The direct sale gas would have the right to 8,000 Mcf. per day of the net firm capacity of the line but would pay

for 33,000 Mcf. per day. It would get about 24 per cent of the net capacity it paid for. On the other hand, the resale gas would get 78,500 Mcf. per day of the net firm capacity of the line but would pay for only 53,500 Mcf. per day. It would get over 147 per cent of the net capacity it paid for. The direct sale gas would thus pay about six times (147/24) as much per unit of firm capacity as the resale gas. Sharing of costs between resale gas and direct sale gas pro rata with their respective peak load obligations (namely, 61.8 per cent and 38.2 per cent respectively) is seen to result in a gross overcharge to direct sale gas.

(B). The error would be further magnified if costs were shared pro rata with annual volumes of gas because the estimated 1940 sales were 52.87 per cent resale gas and 47.13 per cent direct sale gas. Such a basis of charge would result in the direct sale gas paying about eight and one half ($8\frac{1}{2}$) times as much for its line capacity as the resale gas.

Commission WITNESS LESTER (whose qualifications are given at pp. 12877 to 12881), testified as follows: (Vol. CI, pp. 15641-15647.)

Q. On Page 4-B of the statement, if you will turn back to that page now, you have on Page 4-B and 4-A recited certain provisions of the contract between the Canadian River Gas Company and Colorado Interstate Gas Company, and then at the bottom of Page 4-B you make a statement that this subjection of the deliveries to the Interstate company to preference obligations of other contracts is most unusual.

Now, haven't you found in studies of contracts in other fields or other gas companies that frequently where contracts for the sale of gas have been in effect for some time and later contracts are made, that the later contracts are made subject to the obligations of the prior ones?

A. I wasn't referring to that particular thing. What I was referring to as the most unusual thing was that the lower priced gas was being given preference to a higher priced gas. That's actually what I had reference to.

Q. It, of course, was prior in point of time that the deliveries to Amarillo Oil Company were made?

A. That's correct.

Q. Yes. That's where the preference lies, was the fact that the Amarillo Oil Company had been getting gas from them before Colorado Interstate ever came into existence?

A. That's correct.

Q. Now, if you will turn to Exhibit 262 and to your written statement, Page 3, the two items at the top of the page referring to sales of Colorado-Wyoming Gas Company for transportation and resale and to Natural Gas Pipeline Company of America for transportation and resale, now in the use of the word "transportation," I take it you did not mean to imply that those companies were transporting gas for Colorado Interstate Gas Company?

A. No. They are transporting gas for themselves. They are called transportation companies and I was using the phrase merely to mean that the Colorado-Wyoming Gas Company received the gas from the Colorado Interstate Gas Company and transported it for resale.

Q. Yes, I see. Now, then, on Page 4 you have at the

bottom of the page and again on Page 5, certain figures. Do I understand that all of those prices per Mcf. are on the basis of the pressure base of 14.65 pounds?

A. Yes, I'm pretty sure. I'll look it up and see.

Q. The reason I asked you that, for example, you show average revenue for domestic gas 42.1 cents and that is higher than any of the schedules provide for, so I assume that your figures there must be on the uniform pressure base which the Commission uses rather than on the contract pressure base?

A. These are on the uniform pressure base.

Q. That's 14.65?

A. 14.65 pounds.

Q. And using that pressure base would cause a higher cents per Mcf. to be shown than if the contract pressure base of the company were used?

A. Yes, that is correct.

Q. And those figures on Page 5 also are on the same pressure base?

A. They are on the same pressure base.

Q. And again on Page 6 where you have some prices stated?

A. Yes, on the uniform pressure base.

Q. Is that true also of those prices at the top of Page 7?

A. They are on the uniform pressure base of 14.65.

Q. Now if you will turn back to Page 5 with reference to the information at the bottom of the page where you indicate and state that the City of Colorado Springs pays one cent per Mcf. more for gas that it sells to domestic and spaceheating customers and for gas sold at the same city gates of Pueblo and Denver, you no doubt are familiar with the provisions in the Colorado Springs contract under which it would earn certain refunds on the gas for spaceheating, providing certain increases in numbers of customers and volumes were accomplished.

A. Yes.

Q. And in making your study, did you observe that whereas Pueblo and Denver—that is, the Public Service Company of Denver, had made such increases in numbers of customers and volumes of gas that they earned the full 2 cent refund?

A. The Denver and Pueblo earned the full 2-cent refund, yes.

Q. But the City of Colorado Springs has not yet accomplished that thing; that is, they pay a cent more per Mcf.

A. They may be so. The computations is taken directly from the revenues of what actually did take place.

Q. Now, I see what you have done here is just take the actual revenues and relate them without making any attempt to determine whether the schedules were similar or gave them similar rights?

A. The schedule gives them similar rights.

Q. It does?

A. Yes.

Q. Now with respect to the notation you have as to the domestic block of gas for the Citizens Utilities Company and the Arkansas Valley Natural there, those consumers in those towns use less gas per customer than they do other places, do they not?

A. Well, the consumption on the first step is less in the rate than for those towns. I believe they are 1.8 Mcf. instead of the 3 on the first block.

Q. Those are all small communities compared to Pueblo, Colorado Springs and Denver?

A. That's right.

Q. All right, now, if you will turn to Page 9, you make certain reference to certain curtailments of service and have stated that that has never taken place because of the shortage of gas supply in the field, but that there have been certain interruptions because of line breaks and some domestic peak loads.

Now, so far as the industrial customer is concerned, to him the curtailment of his gas is substantially the same thing whether that is caused by a shortage of supply from break in the line or shortage of supply available to him because of increase in demands for domestic customers, would that not be so?

A. Will you read that question, please?

(The question referred to was read by the reporter as set forth above.)

The Witness: As far as he is concerned, that might or might not be so. What I am driving at is that one would be classed an act of God and another one would be at your request due to high domestic peaks.

By Mr. Dougherty:

Q. Well, when you have a break in the line and in order to keep up whatever your domestic load is at that time, then it becomes necessary to shut off or curtail the industries?

A. Yes, that is necessary, too.

Q. That is, whether the lack of capacity is due to increased demands of domestic customers or lack of capacity due to a break which lowers your normal capacity, the result is the same in either event to the industry?

A. Yes, it could be the same.

Q. He doesn't get his gas.

A. I was referring rather to the cause.

Q. I see. Now turn to Page 10, will you, please? You make reference there in the second paragraph; that is, the first full paragraph on the page, that the gas which is sold for resale to the Denver line has preference over that which goes to the Chicago line but that the gas sold to the Chicago line is at a higher price.

Now, so far as the Canadian River Gas Company is concerned, doesn't it get the same price for gas from the Colorado Interstate Gas Company that goes to Chicago as well as to Denver?

A. Since June the 1st, 1938, that is correct.

Q. Previously the statement you made was true; that is, before that date?

A. Before that date, but is true that— well, as far as Canadian River goes, but as far as Colorado Interstate that is not so.

Q. Well, what Colorado Interstate does is sell gas to the Chicago line at a fixed price?

A. That is correct, and it is higher than the average price that is delivered to the two lines.

Mr. Lange: You mean higher than the average price delivered to what lines?

The Witness: To Chicago line than to the Denver line.

* * * * *

MR. LESTER further testified: (Vol. C1, pp. 15653-15657.)

Q. Mr. Lester, returning to your Exhibits 261 and 262, I will ask you whether or not they contain tables showing interruptions in service, point of delivery, date, customer, duration, and cause?

A. There is a table in there showing that information.

Q. Now, then, these Exhibits 262 and 261 were prepared by you and include matters pertaining to both of these companies down through December 31, 1939?

A. That is correct.

Q. Have you had occasion since the completion of these exhibits to study the history of all interruptions in service of both companies, particularly the information that was set forth in the company's exhibit 290, prepared by Mr. Beardsley?

A. Yes, I have reviewed that exhibit.

Q. Please refer to Exhibit 290 at this time and state what your opinions and conclusions are in connection with the interruptions in service of both companies.

A. There has been no further interruption of the Canadian River Gas Company.

Q. Of the Canadian River Gas Company?

A. Of the Canadian River Gas Company during 1940.

Q. So those interruptions set forth in your Exhibit 261 are all that you have any knowledge of?

A. That is all I have any knowledge of and I commented upon those interruptions.

Q. All right, let us move to the Colorado Interstate Gas Company.

A. In reviewing the information in Exhibit 290, on Table 2 in that Exhibit is a statement of total interruptions in service to December 31, 1940.

Q. That is Table 2 pertaining to which company?

A. The Colorado Interstate Gas Company—I guess there is a mixup on the table numbers in the exhibit.

Q. Is the table the second to the last one in the exhibit?

A. Yes, the second to the last table in the exhibit.

Q. What statement did you have to make with reference to that table?

A. This is the total interruptions of the company and it shows the hours of duration, also indicates the cause for the total interruptions. The cause of the total interruptions in all cases was due to either pipe failure or washout. Washout, of course, is a cause of pipe failure. It is more or less due to the act of Nature.

The main line industrial total interruptions due to physical causes for the 13 years amounted to 111.5 or 1.7 hours per main line industrial customer.

Q. During the entire history of the company?

A. During the entire history of the company. There are also washouts for the Colorado-Wyoming Gas Company and to the city gate included in there. They amounted to 157.5 hours for the entire service of the company.

Q. In the course of the prepartion of these two exhibits you have had all relevant data and records available to you for your inspection?

A. Yes, except the last year.

Q. Except the year 1940?

A. Yes, sir.

Q. Now, then, from your examination of the company's records, particularly those records pertaining to suspensions, interruptions, reduction or interruptions in service, did you find during the entire history of the companies that they lost any customers due to interruptions or suspensions of service?

A. No.

Q. If there had been such a customer loss for any one of those reasons, you would have learned of it in connection with your search of the records?

A. Yes, sir, prior to 1940. I haven't searched the record in 1940.

Q. In so far as 1940 is concerned, does this Exhibit 290, which sets forth reductions and suspensions in service, indicate that any of the customers shown ceased purchasing gas from the company?

A. Not for those causes, no. There is one that has—the Citizens Utilities Company took part of the operation over but they are delivering to all of the city gates and same delivery points during 1940. As to those companies who

interruptions are referred to there, they are still delivering to them.

Q. Borrowing Mr. Keffer's use of the homely illustration about "proof of the pudding is in the eating," would you say that the proof of the pudding with reference to whether these customers of the company are taking these suspensions, reductions, or interruptions in service, as a reason for not purchasing further supplies of gas is not in this picture?

A. No.

Q. In other words, there has been no loss of customers in so far as you know due to any one or all of those factors?

A. That is correct. There has been none. No loss.

Now turning over to the reduction in there, the reduction to the main line industrials amounts to 1.7 hours per year per main line customer.

Q. And you have heard—or, I'll ask you whether you did hear any of the testimony that was given by either one or more of the rate of return witnesses setting forth the fact that these interruptions or reduction in service were risks that the company had to face in its business?

A. I heard some of them testifying to that.

Q. Well, it didn't result in their loss of any customers so far as you know?

A. No, it did not result in the loss of any customers.

* * * * *

MR. LESTER further testified: (Vol. CI, pp. 15664-15665.)

Q. Mr. Lester, as I understand it, in arriving at the total number of hours of interruptions that you mentioned a moment ago in connection with Mr. Beardsley's Exhibit 290, you merely added up the hours from his exhibit? That was a matter of calculation?

A. That is correct.

Q. You take no exceptions to the accuracy of the data contained in Exhibit 290, do you?

A. Neither pro or con. I don't know. I have accepted it in my additions to be correct.

Q. You were asked by Mr. Lange whether there was any loss in customers as the result of any of these interruptions, I believe, and I think your answer was that there had been none?

A. Yes.

Q. Whose customers did you have in mind when you gave that answer?

A. I had in mind the Colorado Interstate's customers and the Canadian River's customers.

Q. That is all?

A. Yes, that is all.

Q. You didn't have in mind in that answer the customers of any of the distributing companies?

A. No, sir.

Q. So that your only check on that proposition as to whether there had been any loss in customers was to determine, I assume, from the records of the company that the company was continuing to furnish the same customers with gas as heretofore?

A. Yes, it is the same companies that the interruptions referred to.

Witness Lusk, in Exhibit 318, applying the methods and percentages so arrived at by Mr. Rhodes in Exhibit 316, apportioned the costs to Colorado Interstate for gas delivered to it at Clayton Juntion, as between resale and direct sale gas. The costs so to be apportioned are the total costs by operating systems as set forth in Exhibit 164, abstracted under Title 29, supra. Such costs cover (a) costs arising from operating and maintaining the property owned by the company, and (b) payments reimbursing Colorado Interstate, with interest for the funds advanced by it and used in the purchase and development of the property. The method of determining the costs of operations of Canadian is the basic method used in its contract for the sale of gas to Colorado Interstate, in Exhibit 16.

In Mr. Rhodes' Exhibit 316 he did not treat of the apportionment of amortization of debt, interest and Federal taxes. Mr. Lusk, in his Exhibit 318, pointed out that in Exhibit 164 the cost of amortizing the debt to Colorado Interstate was used (in lieu of depletion and depreciation) in accordance with the basic terms of the contract. He therefore concluded that the amortization of debt applicable to leaseholds and the gas well construction is appropriately apportioned to the several classes of business pro rata with

their respective property apportionments, and that amortization of debt applicable to all other property is appropriately apportioned pro rata with the apportionment of the property for which the debt was incurred.

The same method of apportionment was adopted with respect to interest.

With respect to the Federal taxes, Mr. Lusk stated that these taxes, as determined and set forth in Exhibit 164, arise from all classes of business of Canadian, and that they are appropriately apportioned to the several classes of business in proportion to the respective taxable net incomes arising from these classes of business. (Pp. 1 to 3 of Exhibit 318.)

Mr. Lusk then stated that in Exhibits 164 and 167, abstracted supra under Titles 29 and 30, he determined the computed costs under basic contract terms for all gas and for resale gas only under the contract between Colorado Interstate and Canadian of January 3, 1928 (Exhibit 16, which, under Exhibit 164, for all gas was $1,221,008, and under Exhibit 167 for resale gas alone was $954,874, indicating an apparent cost of direct sale gas of $266,134.

As shown on Statement 1 of Exhibit 318, the amount apportioned to direct sale gas in 1939 was $439,497. (P. 4 of Exhibit 318.)

Statements 3 to 8 attached to the exhibit show the detailed apportionment of operating costs under basic contract terms for the year 1939 to the several classes of business, and to resale gas and direct sale gas deliveries to Colorado Interstate at Clayton Junction.

Statement 2 summarizes the apportionment of costs by operating systems for each year from 1928 to 1947, inclusive, by principal classes of business, and by resale and direct sale gas deliveries to Colorado Interstate at Clayton Junction.

Statement No. 1 summarizes Canadian's costs under the basic contract terms of gas delivered to Colorado Interstate at Clayton Junction for resale and direct sale gas as follows:

Canadian River Gas Company

Apportioned Costs of Gas Under Basic Contract Terms
Between Resale Gas and Direct Sale Gas Deliveries
To Colorado Interstate Gas Company,
At Clayton Junction, New Mexico

Summary by Years—1928 to 1947, Inclusive (A)

Year (1)	Resale Gas (2)	Direct Sale Gas (3)	Total (4)
1928 (B)	$ 123,266	$105,650	$ 228,916
1929	483,635	379,429	863,064
1930	956,310	646,666	1,602,976
1931	1,041,655	646,762	1,688,417
1932	902,561	504,860	1,407,421
1933	871,014	477,082	1,348,096
1934	763,112	485,517	1,248,629
1935	706,233	402,846	1,109,079
1936	708,623	465,774	1,174,397
1937	762,301	439,856	1,202,157
1938	817,456	390,354	1,207,810
1939	823,932	435,497	1,259,429
1940	894,520	462,201	1,356,721
1941	885,198	427,550	1,312,748
1942	874,827	405,642	1,280,469
1943	899,824	398,326	1,298,150
1944	885,135	385,442	1,270,577
1945	870,354	373,371	1,243,725
1946	858,444	371,651	1,230,095
1947	1,151,046	565,428	1,716,474

Notes: (A) From Statement No. 2 attached.

(B) 7 Months.

65. Company's Statement as to Revenues Required to be Received from Colorado Interstate on a Regulatory Rate Basis for Gas Delivered at Clayton Junction Apportioned Between Resale Gas and Direct Sale Gas.

Exhibit 317 (Vol. CII, p. 15954), Witness Lusk, is entitled, "Apportioned Revenues from Gas Required on a Regulatory Basis Between Resale Gas and Direct Sale Gas Deliveries to Colorado Interstate Gas Company, at Clayton Junction, New Mexico. Summary by Years 1939 to 1947, Inclusive."

Here again he adopts and applies the methods of apportionment described in Mr. Rhodes' Exhibit 316, and on such basis determines the revenues required from Colorado Interstate for gas delivered at Clayton Junction, apportioned as between resale and direct sale gas.

Mr. Lusk stated that the costs of operation and required revenue to be apportioned are those shown in Exhibit 276, abstracted supra under Title 34.

As Mr. Rhodes, in Exhibit 316, did not treat of the apportionment of depletion, depreciation or amortization, return and Federal income taxes, Mr. Lusk adopted the following methods for the apportionment of these items. As to the apportionment of amortization, he stated that in Exhibit 276 the cost of amortizing the property by 1956 was used in lieu of depletion and depreciation, and that no provision was made for replacing any property except facilities such as drilling and cleaning equipment and automobiles and trucks. The amortization costs applicable to leaseholds and gas well construction were apportioned by Lusk to the several classes of business pro rata with respect to their property apportionment. The amortization costs applicable to all other property were apportioned by Lusk pro rata with the apportionment of the property itself. (P. 1, Exhibit 317.)

As to return, he apportioned it to the several classes of business pro rata with the total amount of property so apportioned.

As to Federal taxes, as determined and set forth in Exhibit 276, he apportioned them to the several classes of business in proportion to the respective taxable net incomes

arising from these several classes of business. (P. 2, Exhibit 317.)

He then referred to Exhibits 276 and 277, where there was determined the required revenues from gas on a regulatory rate basis delivered at Clayton Junction to Colorado Interstate, for all gas and for resale gas only, respectively, which determinations were made under the provisions of the contract of January 3, 1928, between Canadian and Colorado Interstate (Exhibit 16). The required revenue there shown for the year 1939, in Exhibit 276 (all gas), is $1,339,860, and in Exhibit 277 (resale gas alone), $1,051,079, with an apparent cost of direct sale gas in the amount of $288,781.

Following the procedure in the exhibit last above abstracted, Statements 3 to 8 show the detailed apportionment of operating costs and required revenues for the year 1939, as shown in Exhibit 276, to the several classes of business, and between resale and direct sale gas at Clayton Junction.

Statement 2 summarizes the apportionment of costs by operating systems for each year from 1939 to 1947, inclusive, by principal classes of business and by resale and direct sale gas deliveries to Colorado Interstate at Clayton Junction. (P. 4, Exhibit 317.)

Statement 1 summarizes the amounts apportioned in accordance with the methods set forth in Mr. Rhodes' Exhibit 316, that Canadian is entitled to receive on a regulatory rate basis from Colorado Interstate for resale and direct sale gas delivered at Clayton Junction, as follows:

Canadian River Gas Company

Apportioned Revenues Required from Gas on a Regulatory Basis (A) Between Resale Gas and Direct Sale Gas Deliveries

To Colorado Interstate Gas Company, at Clayton Junction, New Mexico

Summary by Years—1939 to 1947, Inclusive

Year (1)	Resale Gas (2)	Direct Sale Gas (3)	Total (4)
1939	$ 920,265	$446,153	$1,366,418
1940	1,051,028	510,927	1,561,955
1941	1,104,761	504,625	1,609,386
1942	1,096,698	482,165	1,578,863
1943	1,165,938	488,910	1,654,848
1944	1,205,216	489,657	1,694,873
1945	1,239,457	488,045	1,727,502
1946	1,288,770	510,559	1,799,329
1947	1,816,663	842,830	2,659,493

Note: (A) Includes an allowance of 8 per cent return on a depleted and depreciated original cost rate base at January 1, 1939, plus additions thereafter at cost, and provision for depletion, depreciation and amortization by a sinking fund method with compound interest at a rate of 2¾ per cent per annum.

66. Company's Statement as to Revenue Required to be Received from Colorado Interstate for Gas Delivered at Clayton Junction Based Upon 7c Per Mcf. Market Value of Gas at Bivins Intake.

Under title 22 supra there has heretofore been abstracted the Company's evidence as to the 4-cent per Mcf. wellhead market value of gas and an estimated 7-cent per Mcf. market value at Bivins Intake after gathering.

Through the WITNESS LUSK there was introduced and received in evidence respondent's Exhibit 321. (Vol. CII, Second Part, page 16020.) Statement No. 2 of Exhibit 321 is shown as follows:

Statement No. 2

Canadian River Gas Company

Required Revenues on a Regulatory Rate Basis from All Gas Sales Based on a Cost of Gas at Bivins Station of 7c per Mcf. (16.4 Lb.)

1939 to 1947, Inclusive

Item No.	Description	1939	1940	1941	1942	1943	1944	1945	1946	1947
1.	Gas Deliveries at Bivins Station—Mcf. Input (Exhibit No. 164, Statement No. 10)	19,351,503	19,835,803	21,386,114	21,872,483	22,005,038	22,457,139	22,905,308	22,905,308	22,905,308
2.	Cost of Gas at 7 Cents per Mcf.	$1,354,605	$1,388,506	$1,497,028	$1,531,074	$1,540,353	$1,572,000	$1,603,372	$1,603,372	$1,603,372
3.	Transmission Cost (Exhibit No. 276, Statement No. 4)	580,934	701,598	725,895	726,264	800,748	831,797	860,667	893,073	933,016
4.	Total Canadian River Gas Co.	$1,935,539	$2,090,104	$2,222,923	$2,257,338	$2,341,101	$2,403,797	$2,464,039	$2,496,445	$2,536,388
	Cost of Gas to C.I.G. Co. at Clayton Junction:									
5.	Per Cent (Exhibit No. 276, Statement No. 4)	97.70%	97.76%	97.91%	97.95%	97.95%	97.99%	98.02%	98.02%	98.02%
6.	Amount	$1,891,022	$2,043,286	$2,176,464	$2,211,063	$2,293,108	$2,355,481	$2,415,251	$2,447,015	$2,486,168

This Statement No. 2 and the other two statements in Exhibit 321 are explained by Mr. Lusk in his testimony. (Vol. 102, Second Part, pages 16010 to 16020.) As indicated by Statement No. 2, the gas deliveries at Bivins Station for the different years, 1939 to 1947, are taken from Exhibit No. 164, Statement No. 10, and the transmission cost from Bivins Station to Clayton Junction, shown on line 3 of Statement 2, is taken from Exhibit No. 276, Statement No. 4.

Exhibit 164, Canadian's WITNESS LUSK, Statement No. 10, column 15, states the actual deliveries of gas by Canadian to Colorado Interstate at Clayton, New Mexico, at 16.4-pound pressure base in Mcf. for the years 1928 to 1947, inclusive, as follows:

Year	Gas Delivered at Clayton to C.I.G. Co. (15)
1928	2,926,886
1929	9,775,441
1930	11,847,757
1931	12,511,839
1932	12,170,499
1933	11,466,028
1934	11,982,834

Cross-examination of WITNESS LUSK has been abstracted under title 40 supra.

Transcript of record filed September 9, 1942.

And thereafter the following proceedings were had in said cause in the United States Circuit Court of Appeals for the Tenth Circuit:

Order of Submission.

Sixth Day, September Term, Tuesday, September 14th, A. D. 1943. Before Honorable Sam G. Bratton, Honorable Walter A. Huxman and Honorable Alfred P. Murrah, Circuit Judges.

These causes came on to be heard, Elmer L. Brock, Esquire, and E. R. Campbell, Esquire, appearing for Colorado Interstate Gas Company; John P. Akolt, Esquire, and Charles H. Keffer, Esquire, appearing for Canadian River Gas Company; Donald C. McCreery, Esquire, appearing for Colorado-Wyoming Gas Company; Edward H. Lange, Esquire, appearing for Federal Power Commission; Thomas H. Gibson, Esquire, appearing for City and County of Denver.

Thereupon argument was commenced by counsel and continued to the hour of adjournment.

Order of Submission.

Seventh Day, September Term, Wednesday, September 15th, A. D. 1943. Before Honorable Sam G. Bratton, Honorable Walter A. Huxman and Honorable Alfred P. Murrah, Circuit Judges.

These causes came on further to be heard, Elmer L. Brock, Esquire, and E. R. Campbell, Esquire, appearing for Colorado Interstate Gas Company; John P. Akolt, Esquire, and Charles H. Keffer, Esquire, appearing for Canadian River Gas Company; Donald C. McCreery, Esquire, appearing for Colorado-Wyoming Gas Company; Edward H. Lange, Esquire, appearing for Federal Power Commission; Thomas H. Gibson, Esquire, appearing for City and County of Denver.

Thereupon argument by counsel was concluded and the causes were submitted to the court.

Opinion.

[May 16, 1944.]

Elmer L. Brock and E. R. Campbell (Wm. A. Dougherty and C. W. Cooper were with them on the brief) for Petitioner, Colorado Interstate Gas Company.

John P. Akolt and Charles H. Keffer (P. C. Spencer was with them on the brief) for Petitioner, Canadian River Gas Company.

Donald C. McCreery (Lee, Shaw and McCreery, and Wm. A. Bryans, III, were with him on the brief) for Petitioner, Colorado-Wyoming Gas Company.

Edward H. Lange (Charles V. Shannon, L. W. McKernan, and Milford Springer were with him on the brief) for Respondent, Federal Power Commission.

Thomas H. Gibson (Malcolm Lindsey was with him on the brief) for Respondent, City and County of Denver, Colorado.

Before BRATTON, HUXMAN and MURRAH, Circuit Judges.

BRATTON, Circuit Judge:

These cases bring here for review orders of the Federal Power Commission requiring Canadian River Gas Company, Colorado Interstate Gas Company, and Colorado-Wyoming Gas Company to make reductions in their respective rates for natural gas transported in interstate commerce and sold for resale for ultimate public consumption. Reference will be made to the companies as Canadian, Colorado, and Wyoming, respectively.

The City and County of Denver filed with the Commission a complaint charging that the rates of Canadian, Colorado, and Public Service Company were unjust and unreasonable; similarly, the Public Service Commission of the State of Wyoming filed with the Commission a complaint charging that the rates of Wyoming were unjust and unreasonable; and the Commission instituted on its own motion an investigation into the reasonableness of the rates of Canadian, Colorado, and Wyoming. Canadian and Colorado filed with the Commission their joint application for

a stay of the order directing that the investigation be instituted; the Commission denied the application; the companies sought review; and it was denied on the ground that the order was merely preliminary and procedural and therefore not open to review. Canadian River Gas Co. v. Federal Power Commission, 110 F. (2d) 350, 113 F. (2d) 1010, certiorari denied, 311 U. S. 693. By order of the Commission, the three proceedings were consolidated for purposes of hearing. At the conclusion of extended hearings, the Commission found that the revenues and costs of the companies for 1939 were fairly representative of the relationship which would exist between such items in the immediate future, and that use of the figures for that year resolved most of the doubts as to future operation conditions in favor of the companies. Using the figures for 1939, the Commission determined that the rates and charges of Canadian for gas sold to Colorado and Clayton Gas Company were unjust and unreasonable to the extent of $561,000 annually; that the rates and charges of Colorado were unjust and unreasonable in the amount of $2,065,000 annually; and that those of Wyoming were unjust and unreasonable in the sum of $119,000. The Commission ordered the companies to reduce their rates and charges by not less than such amounts, respectively, and directed that schedules of rates be filed effecting such reductions. The companies applied for a rehearing; the Commission denied the applications; and the companies severally sought review.

Southwestern Development Company, through its wholly owned subsidiary, Amarillo Oil Company, owned gas leaseholds in more than 315,000 acres of land in the Texas Panhandle Field; Cities Service Company, through its wholly owned subsidiary, Public Service Company, at Denver, Colorado, and its wholly owned subsidiary, Pueblo Gas and Fuel Company, at Pueblo, Colorado, controlled the resale market for gas in the two cities, but did not have an adequate supply of natural gas or pipeline facilities for the transportation of natural gas to such cities. After extended negotiations, Southwestern, Cities Service, and Standard Oil Company of New Jersey, entered into an agreement denominated "Memorandum of Stipulations", and dated April 5, 1927. The primary objectives of the contracting parties, as expressed in the agreement, were

the acquisition of natural gas properties in the gas field, the construction of a pipeline from the field to the City of Denver via Pueblo and Colorado Springs, the sale and delivery of natural gas at the city gate of Denver and other cities for distribution in such cities, and the supplying of natural gas to Colorado Fuel and Iron Corporation at Pueblo. Under the terms of the contract, Southwestern was to cause to be transferred to a new wholly owned subsidiary the leaseholds and gas producing properties, and to develop such properties into a source of supply of natural gas; Standard was to cause a corporation to be formed which would construct and maintain a natural gas pipeline and appurtenant facilities for the transmission and sale of gas; and Cities Service, through its subsidiaries, was to obtain franchises and rate ordinances in Denver and Pueblo, respectively, for the sale of natural gas, and convert the artificial gas distribution plants then in use in such cities into natural gas distribution plants. The newly formed subsidiary of Southwestern was to sell at cost gas to the pipeline company; and, with provisions for revision which need not be detailed, the pipeline company was to sell and make delivery at the city gate at the rate of forty cents per thousand cubic feet. The producing company and the pipeline company, and the pipeline company and the distributing companies, were to enter into contracts carrying out the commitments made in the Memorandum of Stipulations; and such contracts were to be for a term of twenty years from and after the execution of the first thereof, and as long thereafter as natural gas might be profitably sold by the pipeline company. The contract further provided that in case an acceptable rate ordinance was not secured in the City of Denver, on or before July 1, 1927, the parties thereto, or any of them, might terminate participation therein, and each thereupon be free to act as though such stipulations and any agreements thereunder had never been made.

Franchises and rate ordinances were obtained in Denver and Pueblo; Canadian was incorporated as the subsidiary of Southwestern; and Standard caused Colorado to come into existence. Canadian and Colorado, Colorado and Public Service Company, and Colorado and Pueblo Gas and Fuel Company, respectively, entered into contracts as pro-

vided in the Memorandum of Stipulations; and by contractual arrangements, Colorado obligated itself to sell natural gas to the City of Colorado Springs for distribution by the city in its municipally owned distribution system and for sale to industrial and commercial consumers. Southwestern caused Amarillo Oil Company to convey the leases to Canadian. Canadian paid Amarillo Oil Company the sum of $5,000,000 for the leases and the then producing wells. Southwestern and Standard had agreed upon that amount, and it was paid with funds furnished by Standard. Canadian was financed through the issuance of bonds in the amount of $11,000,000, all of which were purchased by Colorado with funds furnished by Standard. Colorado issued 1,250,000 shares of common stock without par value, of which forty-two and one-half per cent was issued to Southwestern, forty-two and one-half per cent to Standard, and fifteen per cent to Cities Service; and it issued preferred stock valued at $2,000,000, one-half to Standard and one-half to Southwestern. Standard paid Colorado $1,000,000 in cash for the common stock issued to it and a like sum for its preferred stock. No cash consideration was paid for the stock issued to Southwestern or Cities Service. Colorado issued bonds in the amount of $19,200,000. These were sold to Standard for cash at par, and the proceeds, along with the cash which Standard paid for the stock issued by Colorado, aggregating $21,200,000, was used to finance the project. Canadian developed the leaseholds, and constructed a main transmission pipeline from the field to Clayton Junction in New Mexico, a distance of approximately 86 miles; and Colorado constructed a main transmission line from Clayton Junction to the city gate at Denver, a distance approximating 254 miles, three compressors, and various laterals extending from the main line to customers of the company, including a lateral to the plant of Colorado Fuel and Iron Corporation. On December 31, 1939, Canadian had in operation a total of 94 gas wells; and its gathering system consists of about 144 miles of pipe, and has two terminals. One terminal is located at the Bivins Station where the gas there gathered is compressed and then transmitted through the transmission line to Clayton Junction where virtually all of it is sold to Colorado but a small amount is sold to Clayton Gas Company.

The other terminal is located at Fritch Station where the gas there gathered is compressed and then transported through the facilities of Texoma Natural Gas Company to Gray Junction, in Oklahoma, where it is sold to Colorado. Colorado sells that gas to Natural Gas Pipeline Company, and it moves to its destination, known as the Chicago market.

The facilities of Wyoming consist of a main transmission pipe line extending from a point near Littleton, Colorado, to the city gate at Cheyenne, Wyoming, compressor stations, and a number of laterals extending from the main line to city gates and industrial plants in Colorado and Wyoming. From the inception of the project until the latter part of 1929, the company obtained its entire supply of natural gas from the Wellington Field in Colorado. But early in 1929, the supply from that field began diminishing rapidly; it became essential that the company secure another source in order to continue in business; in October of that year, it entered into a contract with Colorado for the purchase of gas from that company with which to supply its customers in the States of Colorado and Wyoming; and ever since Colorado has sold gas to Wyoming, deliveries being made at the point adjacent to Littleton.

In 1939, Canadian sold for resale approximately 46,000,000 Mcf of gas, of which about 41,000,000 Mcf were sold to Colorado; Colorado sold about 20,000,000 Mcf of such gas to Natural Gas Pipeline Company, about 7,000,000 Mcf to Colorado Fuel and Iron Corporation, and about 6,000,000 Mcf to Public Service Company; and Wyoming transported and sold 2,860,000 Mcf, some to affiliates for resale through distribution systems in towns and communities in Colorado and Wyoming, some to other companies for like distribution, some to industrial consumers, and some to United States Army posts.

The Motions to Dismiss—The City and County of Denver filed separate motions to dismiss the petitions for review of Canadian and Colorado, and Public Service Commission of Wyoming filed a like motion to dismiss the petition for review of Wyoming. We denied the motions, but thereafter the City and County filed a brief, and later its counsel participated in the oral argument, renewing the con-

tention that the petitions should be dismissed for want of jurisdiction. The grounds of each motion are that it appears from the face of the petition for review that the petitioning company is a private corporation organized and existing under the laws of Delaware; that the petition fails to allege that the company is located in this circuit; and that it affirmatively appears from the face of the petition, the face of the record, the testimony of the company's own witnesses, and facts dehors the record that the company is not located and does not have its principal place of business in this circuit. These companies were incorporated under the laws of Delaware, and therefore their legal residence and domicile is in that state. Shaw v. Quincy Mining Co., 145 U. S. 444; Southern Pacific Co. v. Denton, 146 U. S. 202; Home Powder Co. v. Géis, 204 F. 568; Continental Coal Corp. v. Roszelle Bros., 242 F. 243; Dryden v. Ranger Refining & Pipe Line Co., 280 F. 257, certiorari denied, 260 U. S. 726; In re Hudson River Navigation Corp., 59 F. (2d) 971.

But section 19(b) of the National Gas Act, 52 Stat. 821, 15 U.S.C.A. § 717r(b), provides that any party to a proceeding under the act who is aggrieved by an order of the Commission made in the proceeding may obtain a review of the order in the Circuit Court of Appeals of any circuit in which the natural gas company to which the order relates is located or has its principal place of business, or in the Court of Appeals of the District of Columbia, by filing in such court within the time specified a petition in writing praying that the order be modified or set aside in whole or in part. It is to be noted that the statute provides in clear language that review may be had either in the circuit where the company is located or in the circuit where its principal place of business is located, the pivotal language being stated in the disjunctive. It is commonplace for a corporation chartered in one state to conduct much or all of its business in another state far distant from that of incorporation. No doubt mature considerations of convenience gave rise to the deliberate care with which Congress, in the exercise of its discretion, authorized review in the circuit within which the principal business of the company is conducted. And the principal place of business is where the actual business of the corporation is conducted or trans-

acted. It is a question of fact to be determined in each particular case by taking into consideration such factors as the character of the corporation, its purposes, the kind of business in which it is engaged, and the situs of its operations. Cf. In re Guanacevi Tunnel Co., 201 F. 316; In re Hudson River Navigation Corp., supra; Chicago Bank of Commerce v. Carter, 61 F. (2d) 986.

Section 5, chapter 65, Revised Code of Delaware, provides that the certificate of incorporation shall set forth the name of the county, and the city, town, or place within the county, in which the principal office or place of business of the corporation is located in that state; and section 32 provides that every corporation shall maintain a principal office or place of business in the state. Here, in each instance, the certificate of incorporation states the location of the principal office of the company in Delaware, but it is completely silent in respect of the place of business. All of the physical properties and business operations of Colorado and Wyoming are located and conducted within this circuit. Wyoming maintains offices in Denver where its executive officers and agents supervise and administer its properties and operations. Canadian transports almost ninety per cent of the natural gas which it produces into this circuit, part into New Mexico and part into Oklahoma, where virtually all of it is sold to Colorado. The properties of Canadian and Colorado are operated as a unit. The two companies have a single general manager and jointly maintain an office in Colorado Springs, under the charge of such manager, where the supervision, direction, and management of the affairs of both companies are conducted. There are approximately thirty-six employees in the office, some devote their entire time to the business of Colorado and are paid by that company, some divide their time between the business of the two companies, and their salaries are paid partly by each company. The general manager is in charge of all operations of Canadian, including the gas fields and a field operating office in Texas; the chief dispatcher, who keeps in constant touch with the expected demands for gas and gives orders for the amount of gas to be piped, has his office in Colorado Springs and is under the supervision of the general manager. The principal books of account are kept in Colorado

Springs, under the direction of the assistant treasurer of the company who maintains his office there. All major purchases for both companies are made and all bills for materials purchased are paid by vouchers issued out of the office there; all dealings between the two companies in connection with the purchase and sale of gas are conducted in and through the office there; and the principal bank account of Canadian is kept in banks in that city. We think it is clear that the principal place of business of each company is in this circuit, within the meaning of the statute. Continental Coal Corp. v. Roszelle Bros., supra; Dryden v. Ranger Refining & Pipe Line Co., supra; In re Lone Star Shipbuilding Co., 6 F. (2d) 192. And we therefore adhere to the view that the motions to dismiss are illfounded.

Jurisdiction of Production and Gathering Properties—Canadian attacks the order relating to the reduction in its rates and charges on the ground that the Commission erroneously undertook to exercise unauthorized rate-regulatory jurisdiction over the production and gathering properties, facilities and business of the company. Section 1(a) of the Act, supra, declares "that the business of transporting and selling natural gas for ultimate distribution to the public is affected with a public interest, and that Federal regulation . . . relating to the transportation of natural gas and the sale thereof in interstate . . . commerce is necessary in the public interest". Section 1(b) limits the act in its application "to the transportation of natural gas in interstate commerce, to the sale in interstate commerce of natural gas for resale for ultimate public consumption for domestic, commercial, industrial, or any other use, and to natural-gas companies engaged in such transportation or sale", and further provides in express terms that it "shall not apply . . . to the production or gathering of natural gas." Section 2(6) provides that a natural gas company is a company engaged in the transportation of natural gas in interstate commerce, or the sale in interstate commerce of such gas for resale. Section 4(a) declares that rates and charges in connection with the transportation of natural gas subject to the jurisdiction of the Commission "shall be just and reasonable, and any such rate or charge that is not just and reasonable is hereby declared to be unlawful". Section 5(a) directs the Commission to

"determine the just and reasonable rate . . . and shall fix the same by order". Section 6(a) empowers the Commission to "investigate and ascertain the actual legitimate cost of the property of every natural-gas company, the depreciation therein, and, when found necessary for rate-making purposes, other facts which bear on the determination of such cost or depreciation and the fair value of such property". Section 7 vests in the Commission certain powers relating to the improvement, establishment of physical connections, abandonment, construction, or extension of transportation facilities of natural gas companies. Section 8 enables the Commission to require natural gas companies to keep and maintain accounts and records. Section 9 charts the authority of the Commission in relation to rates of depreciation and amortization of the several classes of property of natural gas companies. Section 10 concerns the filing with the Commission of periodic and special reports. Section 11 is addressed to the duties of the Commission respecting state compacts dealing with the conservation, production, transportation, or distribution of natural gas. And section 14(a) authorizes the Commission to "investigate any facts, conditions, practices or matters which it may find necessary or proper to determine whether any person has violated or is about to violate any provision of this Act." The primary legislative purpose in the passage of the Act was to provide comprehensive regulation of the wholesale distribution to public service companies of natural gas moving interstate, and to vest in the Commission as the instrumentality of Congress power to exercise such regulation. Illinois Natural Gas Co. v. Central Illinois Public Service Co., 314 U. S. 498; Public Utilities Commission v. United Fuel Gas Co., 317 U. S. 456. And the grant of powers expressly conferred upon the Commission carried with it by implication all authority reasonably necessary and fairly appropriate to make such powers fully efficacious, and to render effectual the discharge of the duties of the Commission. But, under section 1(b) the Commission does not have express or implied rate-regulatory jurisdiction of the production and gathering of gas.

Canadian is engaged in the business of producing, gathering, transporting and selling interstate natural gas for

resale for ultimate public consumption. It therefore is a natural gas company, subject to the jurisdiction of the Commission in respect to its rates and charges for the gas transported and sold in such commerce. Its production and gathering properties and facilities are parts of its integrated operations. Still, under section 1 of the Act they lie beyond the range of the rate-regulatory jurisdiction of the Commission. But the Commission did not prescribe charges for the production; did not fix rates for the gathering of gas; and did not exercise other rate-regulatory jurisdiction over production or gathering as such, within the meaning of the limiting and forbidding provisions of the Act. The Commission did not attempt to affect in any manner the acquiring and maintaining of gas leaseholds, gas rights, or gas wells. Neither did it undertake to affect anywise the location, construction, extension, or physical connections of pipelines, or the operation of pipelines or other facilities constituting the gathering properties. The rate-regulatory jurisdiction of the Commission was exerted only in respect of rates and charges for natural gas transported in interstate commerce and sold in such commerce for resale for ultimate public consumption. The Commission inquired into and considered the production and gathering properties in respect to cost, depreciation, operating expenses, and revenues. But the inquiry was merely in their relation to the fixing of reasonable rates to be exacted and received for the natural gas moved in interstate commerce and sold for resale. And the order of the Commission in each instance operated only upon such rates and charges. We fail to find in the act anything which expressly or by fair implication indicates a Congressional purpose to restrict or withhold from the Commission jurisdiction in a case of this kind to take into consideration the production and gathering properties only as they have bearing upon the question of the fixing of reasonable rates for gas moved interstate and sold for public consumption.

Abrogation of Prices Fixed by Contract Prior to Effective Date of the Act—While not challenging the constitutional validity of the Act on its face, or as it may be applied in general, Canadian and Colorado advance the contention that here the Commission erred in applying it retrospectively in such manner as to abrogate prices

agreed upon in contracts of limited term entered into and substantially performed prior to the enactment of the Act, at a time when neither company was in fact or in law a utility or common carrier, and when each disclaimed all of the privileges and obligations as such. The contracts between Canadian and Colorado, Colorado and Public Service Company, Colorado and Pueblo Gas and Fuel Company, Colorado and the City of Colorado Springs, and Colorado and Wyoming, respectively, were each executed prior to the date on which the act became effective; they were of limited term; and they had been performed in substantial part at the time the Act went into effect. But at all times, the transportation and sale of natural gas in interstate commerce for wholesale distribution to public service companies or municipalities for resale to domestic consumers was subject to regulation by Congress. Missouri v. Kansas Gas Co., 265 U. S. 298; Illinois Natural Gas Co. v. Central Illinois Public Service Co., supra; Federal Power Commission v. Natural Gas Pipeline Co., 315 U. S. 575; Public Utilities Commission v. United Fuel Gas Co., supra. And the exertion of the power of Congress in its regulation of interstate commerce is not fettered by pre-existing contracts or arrangements. The exercise of power under the Commerce Clause cannot be subordinated to arrangements or stipulations previously effected. Contracts and arrangements of that kind necessarily are entered into with knowledge of the paramount authority of Congress to regulate commerce among the states. Union Bridge Co. v. United States, 204 U. S. 364; Monongahela Bridge v. United States, 216 U. S. 177; Philadelphia Co. v. Stimson, 223 U. S. 605; Philadelphia, Baltimore and Washington Railroad Co. v. Schubert, 224 U. S. 603; Greenleaf Lumber Co. v. Garrison, 237 U. S. 251; Continental Co. v. United States, 259 U. S. 156; Sproles v. Binford, 286 U. S. 374; Radio Commission v. Nelson Bros. Co., 289 U. S. 266.

It is emphasized that at the time the contracts were entered into neither of these companies was in fact or in law a public utility or common carrier, and that each disclaimed all of the privileges and obligations as such. These companies have never sought or acquired any certificate of public convenience and necessity, any franchise, or any right to enter a municipality; they have never advertised or rep-

resented that they would sell gas to the public generally; and they have never filed any rate schedule with any regulatory commission or any other authority. At the time the Act became effective, and since, Canadian transported and sold interstate gas to Colorado, and also made sales for resale to a distributing company; and Colorado made sales for resale to one municipality, four or five distributing companies, and two pipelines, and made direct sales to five industrial customers, under private contracts respecting price, quantity, time of delivery, and so forth. But freedom of contract does not place it within the power of companies engaged in business of that kind to restrict or withhold from the control of Congress at a later time so much of the field of regulation of interstate commerce as they choose to bring within the range of their arrangements. Even though executed prior to the enactment of the Act, contracts of that nature are subject to regulation in the public interest. Cf. Mississippi River Fuel Corp. v. Federal Power Commission, 121 F. (2d) 159.

The companies made large investments on the strength of the contracts but that is not decisive, as in the very nature of things they were made subject to the exercise of the paramount authority of regulation. Radio Commission v. Nelson Bros. Co., supra.

Requiring the Impossible of Canadian—Canadian attacks the order relating to its rates and charges on the further score that it requires the company to do the impossible, and violates due process. The contract between Canadian and Colorado requires Canadian to develop, operate, and maintain its properties with diligence, so as to produce sufficient natural gas to meet the requirements of Colorado; to sell the gas to Colorado at cost; to make no contract for the sale of gas that might impair its capacity to produce gas for delivery to Colorado; to credit Colorado with all revenues, income, or profits which it may receive from any other source; and to disburse funds received from any source only in the discharge of its obligations under the contract with Colorado and any other contracts permitted under its provisions, and in payment of principal and interest on its outstanding indebtedness. It is argued that the contract forecloses any possibility of profit to Canadian

and therefore the order exacts the impossible and is confiscatory. The power to regulate commerce is subject to the limitations and guarantees of the Constitution. Monongahela Navigation Co. v. United States, 148 U. S. 312; United States v. Chicago, Milwaukee, St. Paul and Pacific Railroad Co., 282 U. S. 311. But permissible regulation of rates does not insure that the business shall produce net revenues, and any rate may be decreased which is not the lowest reasonable rate. Federal Power Commission v. Natural Gas Pipeline Co., supra.

This contention in its entirety proceeds upon the premise that since Canadian under the contract sells gas to Colorado at cost, there is no possibility of profit accruing to Canadian. But apparently the argument fails to give consideration to the fact that in connection with the contract under which Canadian furnishes and Colorado accepts the gas, Canadian received initially $5,000,000 in cash from Standard; that Colorado without cash consideration issued to Southwestern forty-two and one-half per cent of all its common stock, and preferred stock of the value of $1,000,000; that Southwestern shares on that basis in the beneficial ownership of Colorado and in its net earnings from time to time; and that in view of the relation existing between Southwestern and Canadian, Canadian in effect shares accordingly. Taking these and other factors into account, there is no basis for challenging the order on the ground that it exacts the impossible and is confiscatory.

The Sufficiency of the Evidence to Support the Finding of Unreasonableness of Rates and Charges—The finding of the Commission that the rates and charges of the companies were unjust and unreasonable is questioned for want of substantial evidence to support it. The passage of the Act did not automatically overthrow the contracts into which these companies had previously entered. Neither did it *ipso facto* set aside the schedules of charges upon which they had agreed. Such rates and charges could be modified only after an express finding of unreasonableness. Wichita Railroad & Light Co. v. Public Utilities Commission, 260 U. S. 48; Allen W. Hinkel Dry Goods Co. v. Wichison Industrial Gas Co., 64 F. (2d) 881. And the right of the Commission to make a finding of unreasonableness

depends upon the existence of the fact. In the absence of substantial evidence to show that the rates and charges in existence are unreasonable, a finding to that effect constitutes the arbitrary exercise of power by administrative fiat and cannot stand. Interstate Commerce Commission v. Louisville and Nashville Railroad Co., 227 U. S. 88.

But a finding of unreasonableness made after a full hearing carries with it a presumption of correctness, and the burden rests upon him who attacks it on review for want of substantial evidence to show the absence of such evidence. An extended analysis of the voluminous evidence would not serve any useful purpose as no two cases of this kind are alike in point of fact. We are content to say that a careful examination of the entire record convinces us that the finding is supported by substantial evidence, and therefore under section 19(b) of the Act, it is conclusive.

The Question of Value—Coming to the question of the rate base, Canadian and Colorado each submitted evidence tending to show reproduction cost new, less observed depreciation, and they also submitted evidence as to the original cost of the property. Wyoming introduced evidence as to actual construction costs, less observed depreciation, plus working capital and additions to plant. The evidence of the Commission staff was restricted to original cost. After considering the estimates of reproduction cost new, less observed depreciation, the Commission concluded that they were too conjectural to have probative value, as they were not based upon established facts, but were subject to the vagaries of theories and imagination. Turning to the evidence of original cost, the Commission found that the properties were all of comparatively recent acquisition or construction; that the accounting records had been sufficiently adequate and well maintained to permit a ready determination of all costs involved; that the major portion of all cost of Canadian and Colorado had been incurred since the adoption by such companies of an accounting system based on the Code of Accounts of the Public Service Commission of Pennsylvania; that the basic facts were clear and essentially undisputed; that they represented the best and only reliable evidence respecting property values; and that, in accordance with section 6 of the act, supra, and under the record in the proceeding, no necessity existed to consider

other factors than original cost. The Commission then determined original cost as of December 31, 1939, deducted a sum representing accrued depreciation, depletion, and amortization, added an amount for working capital and additions to plant, and in the case of Wyoming made a deduction for customer contributions. The amount reached by that method of computation, denominated by the Commission as prudent investment, was adopted as the rate base. The companies contend that the rate base should have been grounded upon present fair value. It must be conceded that the contention finds support in many cases holding that while actual cost, cost of reproduction new, and other elements affecting value should be taken into account and given their proper weight, the final basis of calculation in the regulation of rates of a public utility is a fair return upon the present fair value of the property used for the convenience of the public. Smyth v. Ames, 169 U. S. 466, 546; San Diego Land Co. v. National City, 174 U. S. 739, 757; San Diego Land & Town Co. v. Jasper, 189 U. S. 439, 442; Wilcox v. Consolidated Gas Co., 212 U. S. 19, 41; The Minnesota Rate Cases, 230 U. S. 352, 434; Southwestern Bell Telephone Co. v. Public Servcie Commission, 262 U. S. 276, 287; Bluefield Water Works & Improvement Co. v. Public Service Commission, 262 U. S. 679, 690; Board of Public Utility Commissioners v. New York Telephone Co., 271 U. S. 23, 31; McCardle v. Indianapolis Water Co., 272 U. S. 400, 410; St. Louis & O'Fallon Railway Co. v. United States, 279 U. S. 461, 484; Los Angeles Gas & Electric Corp. v. Railroad Commission, 289 U. S. 287, 305.

But the late case of Federal Power Commission v. Natural Gas Pipeline Co., supra, involved an order of the Commission reducing the rates of two companies engaged in business as a single enterprise in the production and transportation interstate of natural gas for sale at wholesale to public utilities, and the court there held that the "Constitution does not bind rate-making bodies to the service of any single formula or combination of formulas. Agencies to whom this legislative power has been delegated are free, within the ambit of their statutory authority, to make the pragmatic adjustments which may be called for by particular circumstances. Once a fair hearing has been given,

proper findings made and other statutory requirements satisfied, the courts cannot intervene in the absence of a clear showing that the limits of due process have been overstepped. If the Commission's order, as applied to the facts before it and viewed in its entirety, produces no arbitrary result, our inquiry is at an end." And the later case of Federal Power Commission v. Hope Natural Gas Co., 320 U. S. 591, similarly involved an order of the Commission requiring a reduction in rates of a company engaged in the business of producing, purchasing, transporting and selling at the state line natural gas for continuous movement and ultimate distribution in other states. There the rate base adopted by the Commission was substantially identical with that here; and there, as here, it was attacked on the ground that present fair value is the only permissible rate base. But the court rejected the contention and upheld the order. In doing so, the court said that, "Under the statutory standard of 'just and reasonable' it is the result reached not the method employed which is controlling . . . It is not the theory but the impact of the rate order which counts. If the total effect of the rate order cannot be said to be unjust and unreasonable, judicial inquiry under the Act is at an end. The fact that the method employed to reach that result may contain infirmities is not then important." These two cases are controlling. And guided by them; it is clear that neither of these orders is to be invalidated for failure of the Commission to use present fair value as the rate base; unless in its totality it oversteps the limits of due process.

Disallowances in Arriving at Original Cost—In arriving at the original cost of the properties, the Commission eliminated certain items appearing on the books of the companies. Canadian paid to Amarillo Oil Company the sum of $5,000,000 in cash for the leaseholds. Their original cost to Amarillo Oil Company was only $1,879,504. Since Canadian and Amarillo were wholly owned subsidiaries of Southwestern, the Commission eliminated $3,120,496, representing the difference between the cost to Amarillo Oil Company and the amount which Canadian paid. By the Memorandum of Stipulations, Southwestern, the parent of Canadian and Amarillo Oil Company, obligated itself to cause the leaseholds to be devoted to the proposed project.

Disregarding the fiction of separate corporate entity, and looking to substance, the contention that the leaseholds should be included at the figure which Canadian paid Amarillo Oil Company rather than the original cost to Amarillo Oil Company amounts in substance to receiving a return on $5,000,000 for property which actually cost less than $2,000,000. There is no proper place in the field of rate-making for synthetic inflation of that kind. Pennsylvania Power & Light Co. v. Federal Power Commission, 139 F. (2d) 445.

As to Colorado, the Commission eliminated $2,352,940, representing the recorded value of stock payments made to Southwestern and Cities Service for entering into contracts for the sale and purchase of gas. By the Memorandum of Stipulations, Southwestern was obligated to require its subsidiary, Canadian, to enter into a contract to sell gas to Colorado, and Cities Service was similarly obligated to require its subsidiaries, Public Service Company and Pueblo Gas and Fuel Company, each, to enter into a contract for the purchase of gas from Colorado. But, according to the records of Colorado, Canadian refused to enter into the contract for the sale of gas to Colorado, and Cities Service refused to direct or permit its subsidiaries to enter into the contracts for the purchase of gas from Colorado; and thereupon Colorado issued to Southwestern as the nominee of Canadian 10,000 shares of preferred and 531,250 shares of common stock, and issued to Cities Service 187,500 shares of common stock. The resolution of the Board of Directors of Colorado authorizing the issuance of such stock recited that the stock first described be issued as part of the consideration for Canadian entering into the contract, and the stock last described be issued in consideration of Cities Service directing its subsidiaries to enter into contracts. The record offers little or no explanation of the refusal to enter into the contracts as provided with binding effect in the Memorandum of Stipulation, or of the failure of Colorado to exact that they be entered into without additional consideration or inducement. Though the reasons may have been satisfactory to the parties in interest, it is manifest that the legitimate cost of Colorado's property for rate-base purposes could not be swelled by the issuance of

stock in circumstances of that kind. Cf. Northwestern Electric Co. v. Federal Power Commission, 321 U. S. 119.

As to Wyoming, the Commission rejected $82,792.57, representing sums paid to Henry L. Doherty & Company for engineers fees. Wyoming and the Doherty Company maintained a contractual arrangement under which the Doherty Company placed at the service of Wyoming its combined experience, advice, and assistance in solving such problems as might arise in connection with the conduct of the business of Wyoming. The tendered advice and assistance related to numerous services, including designing and construction engineering, and fixed the compensation for each, including an engineering fee equal to five per cent of the cost of construction. An affiliate relationship existed between the two companies; Wyoming was unable on request to furnish the Commission any showing that any cost had been incurred in connection with the rendering of engineering services; and there was testimony that the books and records of Wyoming failed to contain any indication that the fees represented any actual cost of services for which the amount was paid. In short, there was no showing satisfactory to the Commission that any engineering services were rendered. The general rule in rate-making against profits in connection with transactions between affiliates warranted the Commission in eliminating the item. Cf. Pennsylvania Power & Light Co. v. Federal Power Commission, supra.

The Commission eliminated from the capital account of Canadian the sum of $129,032, being expenditures previously charged to current operating expense but now sought to be capitalized; it made a like deduction of $440,050 from the account of Colorado; and that action is challenged. In each instance the company added or sought to add the amount in arriving at its claimed original cost. The amount represented reaccounting rather than the correction of accounting, for the charges were made to operating expense in conformity with the established accounting policy of the company in effect at the time, and they were never considered capital investment until the Commission began its investigation. In respect of many expenditures there is at best an indistinct line of demarca-

tion between operating costs and capital costs. It often is difficult to blueprint a clear distinction between expenditures made for operation and maintenance and those made for construction. And therefore a natural gas company, as defined by the Act, must be allowed to exercise a measure of discretion in making its determination between the two. But a method, reasonably acceptable to good accounting, must be adopted and adhered to consistently. Consistent principles and practices of accounting must be followed. Change cannot be made at will. These companies deliberately exercised their discretion in charging these expenditures to expenses; Canadian has fully recovered from Colorado its expense now sought to be capitalized; and Colorado has treated its expenditures now in question as necessary operating expense to be deducted from earnings before arriving at net profits. The Commission was well within the ambit of its authority in making the deductions on the ground that it would do violence to recognized principles of equity to permit these companies at this late hour to shift their position and treat retroactively these items as capital investment upon which they are entitled to receive return. Cf. Federal Power Commission v. Natural Gas Pipeline Co., supra; Northwestern Electric Co. v. Federal Power Commission, 125 F. (2d) 882, affirmed, 321 U. S. 119; City of Wheeling v. National Gas Co., 175 S. E. 339; Peoples Gas Light & Coke Co. v. Slattery, 25 N. E. (2d) 482.

The Commission made a deduction of $366,507 from the original cost claimed by Canadian for interest during construction, and that action is challenged. Canadian recorded on its books a charge for interest during construction, computed on the basis of a construction period beginning May 1, 1927, and ending October 31, 1928, and including the full amount which Canadian paid Amarillo Oil Company for the leaseholds. The Commission found that regular deliveries of gas commenced the latter part of June, 1928, and continued thereafter. The Commission determined that the construction period ended July 1, 1928, and disallowed interest after that date. The books of Wyoming showed the capitalization of interest during construction. The amount included interest on main line construction and on lateral construction. The Commission disallowed the claim in part on the ground that it represented interest computed on a

proportion of the total cost of the property, estimated by the company to be in excess of that required to handle the business actually done during the period. The Commission characterized the claim as the capitalization of a fictitious and arbitrary amount after the close of the construction period, and stated that interest ceases to be a cost of the original plant when commercial operations begin. These companies were not entitled to interest after the construction period ended and they began to receive earnings. Alabama Power Co. v. McNinch, 94 F. (2d) 601.

Elaboration is unnecessary concerning the disallowance of interest on the amount which Canadian paid Amarillo Oil Company for the leaseholds in excess of the original cost to Amarillo Oil Company. We have previously said that, due to the affiliate relation between Canadian and Amarillo Oil Company, the Commission in arriving at the original cost providently included the property at the amount of the original cost to Amarillo Oil Company. That being its cost for rate-base purposes, it follows that interest on the excess could not be included in the rate base.

The Claim for Going Concern Value—Wyoming claimed an allowance for going concern value as part of its rate base. In rejecting the claim and failing to make any allowance for that element, the Commission found that the amount claimed represented a judgment figure wholly unrelated to any costs or outlays, and was therefore deemed unjustified. It is well settled "that there is an element of value in an assembled and established plant, doing business and earning money, over one not thus advanced" and that such "element of value is a property right, and should be considered in determining the value of the property, upon which the owner has a right to make a fair return when the same is privately owned although dedicated to public use." Des Moines Gas Co. v. City of Des Moines, 238 U. S. 153, 165; City and County of Denver v. Denver Union Water Co., 246 U. S. 178, 191, 192; McCardle v. Indianapolis Water Co., supra; Los Angeles Gas & Electric Corp. v. Railroad Commission, supra. But even though it is an element for appropriate inclusion in the rate base, there is no constitutional exaction that it be separately stated as such and added to cost figures attributable the physical properties. Columbus Gas & Fuel Co. v. Public Utilities

Commission, 292 U. S. 398, 411; Denver Stock Yard Co. v. United States, 304 U. S. 470, 479; Driscoll v. Edison Light & Power Co., 307 U. S. 104; Federal Power Commission v. Natural Gas Pipeline Co., supra. The requirement may be satisfied if a reasonable allowance is "reflected in the other items and particularly in the appraisal of the physical assets as part of the assembled whole." Columbus Gas & Fuel Co. v. Public Utilities Commission, supra.

The amount claimed by the company was $175,000. A valuation engineer residing in New Jersey testified in support of the claim. He stated that he did not employ any mathematical formula in arriving at his conclusion as to amount, and he admitted that it was only a judgment figure. He stated with commendable candor that he reached it "just as a horsetrader looks at a horse and decides what it is worth". The record fails to indicate affirmatively whether the element was indirectly reflected to any extent in other items and in the appraisal of other properties as part of the assembled whole. But in any event, there is no basis on which to rest the conclusion that the failure of the Commission to state separately and add an amount as going concern value overstepped the limits of due process.

Allocation of Cost of Service—The orders are assailed for failure of the Commission to make a separation or allocation of the property used in regular business from that used in unregulated business. Under section 1 of the Act, natural gas moved in interstate commerce and sold for ultimate distribution to the public is subject to regulation by the Commission, but gas transported in interstate commerce and not sold for such distribution to the public as well as gas sold intrastate is not subject to regulation. Each of these companies is engaged in both kinds of business. The Commission expressed its awareness of the necessity of determining the reasonableness or unreasonableness of the rates and charges subject to its jurisdiction, observed that this required the distribution of the total costs of operations, including depreciation, taxes, and a fair return, among the various customers served, individually or by appropriate groups, and commented that to the extent that such costs allocated to sales under the jurisdiction of the Commission were less than revenues received, the rates

and charges made were unjust and unreasonable, and revenues must be reduced accordingly. The Commission further stated that it did not follow from that obligation that an allocation of physical property or portions thereof must be made before any excessive returns were determined. After observing that nowhere in all the evidence submitted by Canadian and Colorado was there a complete presentation of the entire operations, broken down between jurisdictional and nonjurisdictional operations, the Commission determined that all which could be accomplished by an allocation of physical properties could be attained by allocating costs including the return. And the Commission added that such method was by far the most practical and business-like. Following these observations, statements, and findings, the Commission made the allocation as to each company.

Where, as here, a natural gas company is engaged in an integrated business, part of which is subject to regulation and part of which lies beyond the reach of the regulatory jurisdiction of the Commission, some separation of the property, capital, and revenue is essential in order that regulation may be confined to its permitted field. The separation may be appropriately effected by estimating or appraising the value of the property used in the regulated business and that used in the unregulated business. Smith v. Illinois Bell Telephone Company, 282 U. S. 133. But that method in its completeness is not always exclusive of others. The separation or allocation may be effected by application of any formula which makes the principle a working one suitably adapted to the particular circumstances. Columbus Gas & Fuel Co. v. Public Utilities Commission, supra.

The integrated properties of these companies were designed and are being used in making both direct sales and resales. The companies rely on the same transmission and other facilities in serving both classes of customers, and both classes of customers jointly share the benefit of the same facilities and gas supply. In these particular circumstances, an allocation of the cost of supplying gas service to customers cannot be said to be a fatally inappropriate or infirm means of effectuating a separateness of the property and capital used in the integrated business.

But, assuming that the requisite separation may be accomplished by an allocation of cost of service, the method used by the Commission is said to be erroneous. It is argued among other things that it assumes that all of the property is used in common in the conduct of all business, whereas a large portion is used exclusively in the regulated portion, another part is used exclusively in the unregulated portion, and only a part is used in common in both businesses; that in respect to the property which is used in common for both businesses, it fails to give consideration to the priority or preferential use of such property in supplying gas for domestic consumption as against unregulated business, and ignores actual peak demands and load factors; that it operates to minimize all costs, produces apparent cost much less than actual cost, and shifts cost from regulated to unregulated business; and that it is unsound both in fact and law. It may be conceded, without deciding, that the method is not free from defects or imperfections in all its aspects. But even so it cannot be said that as the consequence, the impact of the orders of reduction, each in its totality, produces arbitrary results or oversteps the bounds of due process. Therefore the orders are not open to further judicial inquiry on these grounds. Federal Power Commission v. Natural Gas Pipeline Co., supra; Federal Power Commission v. Hope Natural Gas Co., supra.

Depletion, Depreciation and Amortization—The companies introduced evidence relating to accrued depreciation. It was based upon observed per cent condition of the property. Accrued depletion as determined by Canadian was based on estimates of original and remaining gas reserves. The evidence of the staff of the Commission treated accrued and annual allowances for depreciation on the basis of the application of the service-life principle. The Commission observed that if the theory of observed per cent condition of the property were carried out consistently, it might be considered as having some elements of reasonableness; that the small observed depreciation would find its counterpart in an equivalently small annual charge to operating expenses to cover the yearly added amount of observed depreciation; that this was not done in the estimates submitted by these

companies; that, instead, in calculating expenses chargeable to the consumer high depreciation charges were computed, and in computing return to the company a small deduction from the cost of plant was computed. And after full consideration, the Commission adopted the service-life principle for determining annual and accrued depreciation and the production method for determining annual and accrued depletion of production facilities.

Section 6 of the Act empowers the Commission to determine the depreciation in property used by a natural gas company, but it fails to prescribe the method to be used in the discharge of that function. Depreciation represents the loss, not restored by current maintenance, causing the ultimate retirement of the property. The factors entering into it usually are wear and tear, decay, inadequacy, and obsolescence. And in determining reasonable rates to be charged by a public utility, it is proper to include in the operating expenses an allowance for consumption of capital in order that the integrity of the investment in the service may be maintained. Lindheimer v. Illinois Bell Telephone Co., 292 U. S. 151.

As we understand, the Commission in arriving at accrued depreciation determined the amount to be deducted from original cost on the age-life basis by applying the straight life service method to the property. The contention that the testimony of valuation engineers who examined the property and made estimates in respect of its condition should have been accepted in preference to calculations based on averages and assumptions finds its genesis in Pacific Gas & Electric Co. v. City and County of San Francisco, 265 U. S. 403, and McCardle v. Indianapolis Water Co., supra. But there is no basis in this record on which it can be concluded that the determination of depreciation in the manner adopted by the Commission will result in any of these orders in its entirety causing a failure to restore the capital investment at the end of the term, and therefore no deprivation of property is involved. Once more, in the absence of impingment upon due process, review is ended. Federal Power Commision v. Natural Gas Pipeline Co., supra; Federal Power Commission v. Hope Natural Gas Co., supra.

Gas Reserves—In connection with its determination of annual allowances for depreciation and depletion, the Commission found that Canadian's remaining recoverable gas reserves as of December 31, 1939, were not less than 2,800,000,000 Mcf at 14.65 pounds pressure base and an abandonment pressure of approximately 50 pounds; and that at the then present and expected future rate of production of about 55,000,000 Mcf per year, such reserves would last 53 years. The finding is characterized as arbitrary, capricious, and without any basis in the record. It is said that the reserves were much less in amount and that as a source of supply for long distance pipe lines they will not extend in width beyond 1956. The field is about 125 miles long and varies from 10 to 40 miles. It comprises approximately 1,500,000 acres, of which about 1,000,000 acres produce sweet gas, and some 500,000 acres produce sour gas. Oil is produced in a portion of the field. Natural gas was discovered in 1918, on acreage now owned by Canadian; and at the time of the hearings in these proceedings there were about 1650 wells producing gas only, and about 4200 wells producing both oil and gas.

The two methods most frequently used in estimating recoverable gas reserves are the rock pressure decline method and the sand thickness porosity method. Using the pressure decline method, an experienced geologist and petroleum engineer on the staff of the Commission testified at length. He estimated that the reserves for the entire field were 22,420,000,000 Mcf, and that those of Canadian were 3,645,213,000 Mcf. For the purpose of determining the true average or equilibrium pressure prevailing throughout the field, he divided the field into areas of comparatively equal pressures, called quadrants, and made an estimate for each quadrant. His estimate in the aggregate was the sum of his estimates for the several quadrants. A scientific article published in 1933 was introduced in evidence in which the recoverable reserves in the field were estimated to be 16,100,000,000 Mcf. Two qualified experts testified for Canadian. One used the sand thickness porosity method, and he estimated that the reserves in the field amounted to 9,532,027,596. The other used the open flow method which is a variation of the sand thickness porosity method, and his estimate of the field was 8,910,132,111 Mcf. And there

was much other evidence having bearing upon the question. The Commission found itself unable to accept in toto any of the estimates. The Commission observed that the pressure decline method is recognized as a satisfactory method of estimating gas reserves in fields that are depleted as much as fifteen per cent or more and where reliable pressure and production data are available; that the Texas Panhandle Field met these qualifications; that it was a well developed field; and that the pressure and production records maintained by the Railroad Commission of that state were adequate and satisfactory. The Commission found that the pressure decline method was to be desired over the methods used by the witnesses for the company; that the estimates of the witnesses for the company were not founded on proper data and must be considered essentially unreliable; that if the method of averaging quadrants was incorrect, it favored the company position of lower reserves; that the acreage of the company was among the very best in the entire field; and that after weighing all pertinent facts of record and making due allowance for the criticisms of the estimate submitted by the Commission staff, the recoverable reserves were found to be not less than 2,800,000,000 Mcf of gas.

The rock pressure decline method of estimating recoverable reserves of natural gas is not only accepted practice among mining engineers but it has been accorded judicial recognition. Dayton Power & Light Co. v. Public Utilities Commission, 292 U. S. 290. It lay within the discretion of the Commission to select that method as the most satisfactory and reliable means of determining the reserves of Canadian. And the Commission was not required to accept at face value the opinion evidence of the witnesses who testified as experts in respect to volume. The weight to be given to their evidence was a matter for the appraisal and judgment of the Commission, in the light of the circumstances. Existing volume, pressure differentials and consequent drainage, and other recovery factors should be given consideration in arriving at a final conclusion concerning the reserves. But it nowhere appears that the Commission failed appropriately to weigh these elements.

As has already been said, section 19(b) of the Act

provides that a finding of fact made by the Commission shall be conclusive on review if it is supported by substantial evidence. Congress thus committed to the Commission the function of weighing evidence, drawing inferences from the facts and circumstances established, and choosing between conflicting inferences. And a court is not free to substitute its view of the facts for that of the Commission. The underlying considerations which actuated Congress in vesting that power in the Commission are clear. The Commission often deals with subjects which are specialized, technical, and complex. It is relatively better staffed for its task than are the courts. And its members frequently bring to the discharge of their duties rich experience in those particular fields. The determination of the recoverable reserves of this company necessarily involved specialized and technical factors. The evidence relating to the question extends to great lengths. No useful end would be served by a detailed analysis of it. We think the finding is supported by substantial evidence and therefore is not vulnerable to the charge of lacking basis in the record.

Fair Rate of Return—The evidence submitted by the companies relating to a fair annual return upon the rate base varied in amount from 8 per cent to 9.17 per cent, while that of the Commission staff was 6½ per cent. The Commission fixed 6½ per cent for all three companies. The Commission stated in that connection that there was no exact formula for determining a reasonable rate of return: that in the final analysis the rate must be the best judgment of the Commission, founded upon the evidence and guided by the basic facts required by law to be considered; that consideration must be given to the return earned by like investments which are attended by corresponding risks and uncertainties in the same vicinity over the same period of time; that Canadian had a long-term and essentially cost of service contract with its affiliate, Colorado; that the sales of Colorado and Wyoming were also principally to subsidiaries or affiliates and to stable markets; that Colorado's principal industrial sales were also to an affiliate—Colorado Fuel and Iron Corporation; and that all these facts materially reduced basic business risks that might be present under other circumstances.

The rate of return which will constitute just compensation depends upon the circumstances. A public utility is entitled to such rates as will permit it to earn a return on the value of its property devoted to the convenience of the public substantially equal to that generally being earned in that area by other business enterprises which are attended by corresponding characteristics, including uncertainties, risks, hazards, and other elements affecting the operations. The return should be sufficient in amount to assure confidence in the financial soundness of the utility, and to enable it under efficient management to maintain its credit. Bluefield Water Works & Improvement Co. v. Public Service Commission, supra. But no formula can be laid down which will apply uniformly in all cases or to all kinds of utilities. That which is fair for one may be quite inadequate for another, depending upon the difference in circumstances. And the ascertainment of a fair return in a given case is a matter incapable of exact mathematical demonstration. It is one of reasonable approximation having its basis in a proper consideration of all relevant facts. Willcox v. Consolidated Gas Co., supra; United Railways and Electric Co. v. West, 280 U. S. 234.

Making application of these principals, and taking into consideration the history of these companies, their relations and opportunities, their position for future financing, the stability of demand for their product, and other relevant factors, we think that a return of 6½ per cent on the rate base as fixed by the Commission is not so inadequate as to amount to confiscation. Federal Power Commission v. Natural Gas Pipeline Co., supra; Federal Power Commission v. Hope Natural Gas Co., supra.

Finally, the Commission made allowances for working capital and additions to plant of all three companies, and these are attacked for insufficiency in amount; the Commission rejected some claims, and the companies predicate error on that action; and the Commission made certain adjustments, of which the companies complain. We do not discuss these seriatim. To do so would only extend this opinion, without adding anything of value to the accelerating accumulation of judicial utterances. The Commission was empowered to make pragmatic adjustments for which the

particular circumstances call. Federal Power Commission v. Natural Gas Pipeline Co., supra. On the whole record, we are unable to say that any of these orders in its total effect produces any arbitrary result or does violence to due mission v. Natural Gas Pipeline Co., supra; Federal Power Commission v. Hope Natural Gas Co., supra.

The orders are severally

AFFIRMED.

Decree, No. 2550.

Twenty-seventh Day, May Term, Saturday, July 8th, A. D. 1944. Before Honorable Orie L. Phillips, Honorable Sam G. Bratton and Honorable Alfred P. Murrah, Circuit Judges.

This cause came on to be heard on the transcript of record from the Federal Power Commission, and was argued by counsel.

On consideration whereof, it is now here ordered, adjudged and decreed by this Court that the orders of March 18, 1942 and April 22, 1942 of the Federal Power Commission in this cause be, and the same are hereby affirmed.

Decree, No. 2551.

Twenty-seventh Day, May Term, Saturday, July 8th, A. D. 1944. Before Honorable Orie L. Phillips, Honorable Sam G. Bratton and Honorable Alfred P. Murrah, Circuit Judges.

This cause came on to be heard on the transcript of record from the Federal Power Commission, and was argued by counsel.

Upon consideration whereof, it is now here ordered, adjudged and decreed by this Court that the orders of March 18, 1942 and April 22, 1942 of the Federal Power Commission in this cause be, and the same are hereby affirmed.

Stay Order.

Twenty-seventh Day, May Term, Saturday, July 8th, A. D. 1944. Before Honorable Orie L. Phillips, Honorable Sam G. Bratton and Honorable Alfred P. Murrah, Circuit Judges.

This matter coming on for hearing this day before the Court on the motion of petitioner for continuance of stay order and stay of issuance of mandate; and the Court having considered said motion, as well as motion of the City and County of Denver to dismiss said motion of petitioner, and the argument thereon:

And the Court having this day entered its judgment herein pursuant to the Court's opinion heretofore filed in this cause:

It is now ordered that the stay order entered herein on May 16, 1942, on the terms and conditions therein set forth, be and the same is hereby continued in full force and effect for the period of 60 days from and after the date hereof, and if within said period of 60 days a petition for certiorari is filed in the Supreme Court of the United States and a certificate thereof is filed in this Court within said 60 days pursuant to Rule 28 of this Court, then said stay order shall continue in full force and effect until final disposition of said cause by the Supreme Court of the United States.

It is further hereby ordered that issuance of mandate is hereby stayed for said period of 60 days from and after the date hereof, and if within said 60 day period petition for certiorari shall be filed in the Supreme Court of the United States, with due certification as aforesaid, then issuance of mandate shall be stayed until final disposition of said cause by the Supreme Court of the United States.

Clerk's Certificate.

United States Circuit Court of Appeals, Tenth Circuit.

I, Robert B. Cartwright, Clerk of the United States Circuit Court of Appeals for the Tenth Circuit, do hereby certify the foregoing, consisting of eight volumes, as a full, true, and complete copy of the designated transcript of the record from the Federal Power Commission, and full, true,

and complete copies of certain pleadings, record entries and proceedings, including the opinion (except full captions, titles and endorsements omitted in pursuance of the rules of the Supreme Court of the United States) had and filed in the United States Circuit Court of Appeals for the Tenth Circuit in certain causes in said United States Circuit Court of Appeals, No. 2550, wherein Colorado Interstate Gas Company, a corporation, was petitioner, and Federal Power Commission et al. were respondents, and No. 2551, wherein Canadian River Gas Company, a corporation, was petitioner, and Federal Power Commission et al. were respondents, as full, true, and complete as the originals of the same remain on file and of record in my office.

In Testimony Whereof, I hereunto subscribe my name and affix the seal of the United States Circuit Court of Appeals for the Tenth Circuit, at my office in Denver, Colorado, this 19th day of July, A. D. 1944.

(Seal, U. S. Circuit Court of Appeals, Tenth Circuit.)

ROBERT B. CARTWRIGHT,
Clerk of the United States Circuit Court of Appeals, Tenth Circuit.

SUPREME COURT OF THE UNITED STATES, OCTOBER TERM, 1944

No. 379

ORDER ALLOWING CERTIORARI—Filed November 13, 1944

The petition herein for a writ of certiorari to the United States Circuit Court of Appeals for the Tenth Circuit is granted, limited to the fifth and sixth questions presented by the petition for the writ. The case is assigned for argument immediately following No. 296.

And it is further ordered that the duly certified copy of the transcript of the proceedings below which accompanied the petition shall be treated as though filed in response to such writ.

SUPREME COURT OF THE UNITED STATES, OCTOBER TERM, 1944

Nos. 379 & 380

ORDER ALLOWING CERTIORARI, ETC.—January 2, 1945

A petition for rehearing and for enlargement of the scope of review having been filed in case No. 380 by counsel for the Canadian River Gas Company.

Upon consideration thereof, it is ordered by this Court that the said petition for rehearing in case No. 380 be, and the same is hereby, granted.

It is further ordered that the order entered November 13, 1944, be, and the same is hereby, vacated; and that the petition for writ of certiorari herein be, and the same is hereby, granted limited to question 1, 2, 3, and 8 presented by the petition for the writ and the case is assigned for argument immediately following No. 379. Case No. 379 is transferred to the summary docket.

It is further ordered that the duly certified copy of the transcript of the proceedings below which accompanied the petition shall be treated as though filed in response to such writ.

"* * * While the difficulty in making an exact apportionment of the property is apparent, and extreme nicety is not required, only reasonable measures being essential (Rowland v. Boyle, 244 U. S. 106, 108, 61 L. Ed. 1022, 1023, P.U.R. 1917E, 685, 37 S. Ct. 577; Groesbeck v. Duluth, S. S. & A. R. Co., 250 U. S. 607, 614, 63 L. Ed. 1167, 1172, P.U.R. 1920A, 177, 40 S. Ct. 38) it is quite another matter to ignore altogether the actual uses to which the property is put. It is obvious that, unless an apportionment is made, the intrastate service to which the exchange property is allocated will bear an *undue burden*—to what extent is a matter of controversy. We think that this subject requires further consideration, to the end that by some practical method the different uses of the property may be recognized and the return properly attributable to the intrastate service may be ascertained accordingly." (Emphasis supplied.)

Not only does the lack of a separation of property in the Commission's evidence and findings leave its conclusion as to rates a matter of guesswork and baseless, but we submit that we have in the respects above specified been able to demonstrate that its substitute, "cost allocation," has actually operated to shift the cost from the regulated to the unregulated business, and that its Order thereby operates to deprive the petitioner of earnings truly applicable to its unregulated business. The Order, in thus shifting the cost from the regulated to the unregulated business, not only violates statutory standards, but deprives the petitioner of its property, contrary to the due process clause of the Fifth Amendment to the Constitution.

The court below in its Opinion apparently recognized these defects in the Commission's "allocation of costs," but refused us any relief from the Commission's Order, because of its interpretation, erroneous we believe, of this Court's decisions in *Federal Power Commission v. Hope Natural Gas Co.*, supra, and *Federal Power Commission v. Natural Gas Pipeline Co.*, 315 U. S. 575. The Circuit Court (142 Fed. (2d) 943; at 959) said:

"* * * It may be conceded, without deciding, that the method is not free from defects or imperfections in all

its aspects. But even so if cannot be said that as the consequence, the impact of the orders of reduction, each in its totality, produces arbitrary results or oversteps the bounds of due process. Therefore the orders are not open to further judicial inquiry on these grounds. Federal Power Commission v. Natural Gas Pipeline Co., supra; Federal Power Commission v. Hope Natural Gas Co., supra."

Apparently the Circuit Court construes this Court's opinion in the two cases to mean that if "the total effect of the rate order cannot be said to be unjust and unreasonable," then methods and standards are no longer important and judicial inquiry is at an end. Our first observation is, that the "total effect" or "impact" of the rate order in this case is, on its face, unjust and unreasonable. An order which fixes the cost of gas delivered at La Junta to be 24.3 cents per Mcf, and the cost at Denver to be only 15.4 cents per Mcf (R. V. 1, p. 181), despite the fact that the Denver gas has to be compressed more often, and is transported approximately 145 miles farther; is not only unjust and unreasonable, but obviously arbitrary.

Our next observation is that we do not believe that this Court intended to construe the Act to mean that no separation of property is necessary in a case like the present one. In the *Hope* case, 320 U. S. 591, this Court said:

> "* * * The Committee Report stated that the Act provided 'for regulation along recognized and more or less standardized lines' and that there was 'nothing novel in its provisions.'"

It cannot be denied that property separations were recognized and standard procedures in rate making at the time of the adoption of the Act. Even though it be claimed for the Commission that it now possesses some mysterious instinct for reasonable rates, there is nothing in the Act to support any construction that the Commission can so fix rates without regard to such standards, and we do not interpret this Court's decisions as placing any such construction upon the Act.

But if the Act be construed as containing no such standards

and requirements, then it amounts to a naked delegation of the legislative power of Congress, contrary to the Constitution. Either it does contain such standards, in which case the Order is invalid because of their nonobservance, or it does not include such standards, in which case the whole Act and all orders based thereon are void because of such an unconstitutional delegation of legislative power.

No appraisal by this Court of the "end result" or "impact" of the Order, or of the rates fixed as being reasonable, can possibly excuse the admitted failure to make any separation of property, and the consequent violation of constitutional and statutory limitations. To put any such construction on the statute, and to approve any such order, would not only make Congressmen out of the members of the Power Commission, but would grant to them an immunity from constitutional limitation that even Congress itself does not possess.

THE RELATIONSHIP BETWEEN THE ORDER IN THIS CASE AND THAT INVOLVED IN CANADIAN'S CASE, No. 380.

In our petition for certiorari we called attention to the fact that Canadian River Gas Company was simultaneously filing a petition for certiorari, and that the two petitions were made on a joint Printed Record in the Circuit Court of Appeals, and that the two cases were companion cases. On page 9 of Colorado Interstate's petition we said:

> "A part of the reduction of $2,065,000 per year ordered by the Commission as against your petitioner is based upon a reduction ordered in the Canadian case in the price of gas sold by Canadian to petitioner in the amount of $551,000 per annum. In the companion case involving Canadian, it is contended that the Commission and the Court erred in ordering and approving this reduction in the cost of gas, and should Canadian be sustained in its contention that this reduction of $551,000 should not have been ordered, in whole or in part, then it would necessarily follow that the $2,065,000 reduction should be reduced accordingly, and this is a very special reason why, as already indicated, the two petitions for certiorari should be considered together."

This is all the more important now that this Court on petition for rehearing has enlarged the issues to be reviewed in Canadian's case to include three additional questions, because if for any one of the reasons assigned by Canadian in such enlarged review it should be held that the Commission's order reducing the price of gas charged by Canadian to Colorado Interstate is erroneous, then it would follow that the $2,065,000 reduction ordered in Colorado Interstate's case should be reduced accordingly.

When an order is entered in this case it should require the Commission to take cognizance of any revision of the reduction ordered in the Canadian case, and should require the Commission correspondingly to reduce the ordered reduction made by it against Colorado Interstate.

CONCLUSION.

For the reasons set forth herein, the judgment of the Circuit Court of Appeals should be set aside and the case remanded with instructions to enjoin the Order of the Commission.

APPENDIX A.

The pertinent provisions of the Natural Gas Act of 1938 (52 Stat. 821, et seq.; Title 15, U.S.C.A., Sec. 717) are as follows:

Sec. 1 (b). "The provisions of this Act shall apply to the transportation of natural gas in interstate commerce, to the sale in interstate commerce of natural gas for resale for ultimate public consumption for domestic, commercial, industrial, or any other use, and to natural-gas companies engaged in such transportation or sale, but shall not apply to any other transportation or sale of natural gas or to the local distribution of natural gas or to the facilities used for such distribution or to the production or gathering of natural gas."

Section 4 (a). "All rates and charges made, demanded, or received by any natural-gas company for or in connection with the transportation or sale of natural gas subject to the jurisdiction of the Commission, and all rules and regulations affecting or pertaining to such rates or charges, shall be just and reasonable, and any such rate or charge that is not just and reasonable is hereby declared to be unlawful.

(b). "No natual-gas company shall, with respect to any transportation or sale of natural gas subject to the jurisdiction of the Commission, (1) make or grant any undue preference or advantage to any person or subject any person to any undue prejudice or disadvantage, or (2) maintain any unreasonable difference in rates, charges, service, facilities, or in any other respect, either as between localities or as between classes of service.

(c). "Under such rules and regulations as the Commission may prescribe, every natural-gas company shall file with the Commission, within such time (not less than sixty days from the date this Act takes effect) and in such form as the Commission may designate, and shall keep open in convenient form and place for public inspection, schedules showing all rates and charges for any transportation or sale subject to the jurisdiction of the Commission, and the classifications, practices, and regulations affecting such rates and charges, together with all contracts which in any manner affect or relate to such rates, charges, classifications, and services."

Section 5 (a). "Whenever the Commission, after a hearing had upon its own motion or upon complaint of any State, municipality, State commission, or gas distributing company, shall find that any rate, charge, or classification demanded, observed, charged, or collected by any natural-gas company in connection with any transportation or sale of natural gas, subject to the jurisdiction of the Commission, or that any rule, regulation, practice, or contract affecting such rate, charge, or classification is unjust, unreasonable, unduly discriminatory, or preferential, the Commission shall determine the just and reasonable rate, charge, classification, rule, regulation, practice, or contract to be thereafter observed and in force, and shall fix the same by order: *Provided, however*, That the Commission shall have no power to order any increase in any rate contained in the currently effective schedule of such natural gas company on file with the Commission, unless such increase is in accordance with a new schedule filed by such natural gas company; but the Commission may order a decrease where existing rates are unjust, unduly discriminatory, preferential, otherwise unlawful, or are not the lowest reasonable rates."

Section 6 (a). "The Commission may investigate and ascertain the actual legitimate cost of the property of every natural-gas company, the depreciation therein, and, when found necessary for rate-making purposes, other facts which bear on the determination of such cost or depreciation and the fair value of such property."

Section 19 (b). "Any party to a proceeding under this Act aggrieved by an order issued by the Commission in such proceeding may obtain a review of such order in the circuit court of appeals of the United States for any circuit wherein the natural-gas company to which the order relates is located or has its principal place of business, or in the United States Court of Appeals for the District of Columbia, by filing in such court, within sixty days after the order of the Commission upon the application for rehearing, a written petition praying that the order of the Commission be modified or set aside in whole or in part. A copy of such petition shall forthwith be served upon any member of the Commission and thereupon the Commission shall certify and file with the

court a transcript of the record upon which the order complained of was entered. Upon the filing of such transcript such court shall have exclusive jurisdiction to affirm, modify, or set aside such order in whole or in part. No objection to the order of the Commission shall be considered by the court unless such objection shall have been urged before the Commission in the application for rehearing unless there is reasonable ground for failure so to do. The finding of the Commission as to the facts, if supported by substantial evidence, shall be conclusive. If any party shall apply to the court for leave to adduce additional evidence, and shall show to the satisfaction of the court that such additional evidence is material and that there were reasonable grounds for failure to adduce such evidence in the proceedings before the Commission, the court may order such additional evidence to be taken before the Commission and to be adduced upon the hearing in such manner and upon such terms and conditions as to the court may seem proper. The Commission may modify its findings as to the facts by reason of the additional evidence so taken, and it shall file with the court such modified or new findings, which if supported by substantial evidence, shall be conclusive, and its recommendation, if any, for the modification or setting aside of the original order. The judgment and decree of the court, affirming, modifying, or setting aside, in whole or in part, any such order of the Commission, shall be final, subject to review by the Supreme Court of the United States upon certiorari or certification as provided in sections 239 and 240 of the Judicial Code, as amended (U.S.C., title 28, secs. 346 and 347)."

PRESS OF BYRON S. ADAMS, WASHINGTON, D. C.

IN THE

Supreme Court of the United States

OCTOBER TERM, 1944.

No. 379.

COLORADO INTERSTATE GAS COMPANY, a Corporation,
Petitioner,

v.

FEDERAL POWER COMMISSION, ET AL., *Respondents.*

REPLY BRIEF OF PETITIONER.

The Commission, commencing on Page 54 of its Brief, assumes without argument or proof that it is vested with administrative discretion in the matter of allocation. As to sales within its jurisdiction, Petitioner does not dispute that proposition. Here, however, the question relates to the Commission's power over business not subject to its jurisdiction. In that respect the statutory limitations must be given effect. This Court held in the case of *Siler v. L. & N. Railway Company*, 213 U. S. 175, as follows:

> "The Commission as an extraordinary tribunal of the State must have the power therein exercised conferred by a statute in language free from doubt. The

power is not to be taken by implication; it must be given by language which admits of no other reasonable construction."

Additional authorities supporting this proposition are cited on page 34 of the Brief of Canadian River Gas Company, Petitioner in No. 380.

Whatever the Commission's administrative discretion in the adoption of a method of allocation relating to sales under its jurisdiction, it is not true that Congress has left to the expert judgment of the Commission any discretion with respect to sales of gas for consumption. The decisions of this Court in the *Minnesota Rate Cases*, 230 U. S. 352 and in *Smith* v. *Illinois Bell Telephone Company*, 282 U. S. 133, clearly distinguish between the power of a regulatory authority over business subject to its jurisdiction and that business not so subject.

Commission Counsel attempts to distinguish these cases by characterizing them as decisions concerning the power of State agencies over interstate operations, which are constitutionally immune from State regulation. Whatever the power of Congress may be over sales to consumers by a natural gas company, it is certain that as yet such sales are constitutionally immune from Federal Power Commission regulation. The seizure and exercise of authority by the Commission over business not committed by Congress to its jurisdiction is in violation of the 5th Amendment to the Federal Constitution. The duty of the Commission here was first to determine the property used and useful in serving the regulated business and to charge that business with the full costs of the construction and operation of that property.

THE COMMISSION'S ALLOCATION.

Respondent seeks to bring this proceeding within the administrative discretion which it is authorized to exercise in order that Petitioner may be denied its claim of constitutional violation. The reasonableness of the allocation used

by the Commission is not the issue here. Rather, we must determine if the allocation used resulted in a violation of the jurisdictional prohibitions of the Act.

We do not contend that the treatment by the Commission of a transmission line as a unit is beyond its jurisdiction when related solely to the sales over which it has jurisdiction. Such jurisdictional sales were involved in the cases cited by Respondent on Pages 69, 71 and 73 of its Brief. However, when the Commission seeks to charge the unregulable business with costs of construction and operation of property not used and useful in serving that business, it is exceeding its jurisdiction and taking from this Petitioner earnings from that business which Congress has said it may keep. The fact that uniform rates have been established by Petitioner for gas sold at wholesale for distribution in Pueblo, Colorado Springs and Denver, recognizes the treatment of the transmission line as a unit where the sales are subject to jurisdiction. However, the prices charged industrial customers by Petitioner are not uniform, they are not in relation to the quantity of property used but are based on the competitive value of natural gas. These contracts are found in the record Vol. 1, Pages 936 to 956.

THE LACK OF FINDINGS.

Apparently Respondent recognizes the inadequacy of the findings made in respect of the costs assigned to this Petitioner in its opinion. The testimony on allocation of the Commission witness is found in Vols. 4 and 5 of the record, Pages 2316 to 2450. This testimony and the exhibit of the witness treat the operations of Canadian River Gas Company and Petitioner as a unit. Counsel for the Commission now attaches to their Brief as an Appendix certain schedules for the purpose of supplying the information which should have been included in its findings. These are not a part of the record, and when Petitioner requested the Commission to furnish it with such data at the time the order was entered the request was preemptorily refused.

We submit that the Commission cannot now cure that error in its order by such means.

CONCLUSION

The Commission clearly has no jurisdiction over the business carried on by this Petitioner in the sale of gas for consumption by its customers. The Brief of Respondent, Pages 20 and 21, quotes from the report of the House Committee that portion stating that the exceptions contained in Section 1(b) were not necessary stating that "since no jurisdiction is given to the Commission to regulate sales to consumers, the Commission would have no authority over distribution, whether or not local in character." In the Annual Report of the Commission for the year 1940 the lack of jurisdiction over such sales is stated and discussed. This being so, the Commission does not have the discretion which is accorded it when acting within the ambit of its statutory authority.

The use of an allocation method which fails to segregate property on the basis of use and places costs on the non-jurisdictional business, is wholly beyond the Commission's authority. The dollar result is not the only important consideration since it is a matter of principle we are discussing. Whatever may be the dollar result in this particular case, there should now be established the correct principles to govern future Commission action. Large quantities of gas may be sold for consumption by this company and other Companies in the future and a wrong interpretation of the Commission's authority in this case might have serious financial repercussions in future years.

We respectfully submit that the judgment of the Circuit Court of Appeals should be reversed and the case should be remanded to the Commission with instructions to determine the property used and useful in the service under its

jurisdiction under the principles contended for by this Petitioner and heretofore announced by this Court.

Respectfully submitted,

COLORADO INTERSTATE GAS COMPANY, A CORPORATION, PETITIONER

v.

FEDERAL POWER COMMISSION, CITY AND COUNTY OF DENVER, COLORADO, PUBLIC SERVICE COMMISSION OF WYOMING, COLORADO-WYOMING GAS COMPANY, PUBLIC SERVICE COMPANY OF COLORADO, AND CANADIAN RIVER GAS COMPANY

CANADIAN RIVER GAS COMPANY, A CORPORATION, PETITIONER

v.

FEDERAL POWER COMMISSION, CITY AND COUNTY OF DENVER, COLORADO, PUBLIC SERVICE COMMISSION OF WYOMING, COLORADO-WYOMING GAS COMPANY, PUBLIC SERVICE COMPANY OF COLORADO, AND COLORADO INTERSTATE GAS COMPANY

ON PETITIONS FOR WRITS OF CERTIORARI TO THE UNITED STATES CIRCUIT COURT OF APPEALS FOR THE TENTH CIRCUIT

BRIEF FOR THE FEDERAL POWER COMMISSION, CITY AND COUNTY OF DENVER, COLORADO, AND PUBLIC SERVICE COMMISSION OF WYOMING, IN OPPOSITION

OPINIONS BELOW

The opinion and orders of the Federal Power Commission (R. I, 140–192) are reported in 43 P. U. R. (N. S.) 205. The opinion of the circuit court of appeals (R. VIII, 5066–5094) is reported in 142 F. (2d) 943.

JURISDICTION

The judgment of the circuit court of appeals was entered July 8, 1944 (R. VIII, 5094). The petitions for writs of certiorari were filed on August 22, 1944. Jurisdiction of this Court is invoked under Section 19 (b) of the Natural Gas Act, and Section 240 (a) of the Judicial Code, as amended by the Act of February 13, 1925.

QUESTIONS PRESENTED

1. Whether the Commission, in determining Canadian's rate base, properly disallowed that portion of Canadian's claimed cost of gas producing properties and leaseholds which was found to consist of profits obtained by Canadian's affiliates, and, in determining Colorado's rate base, properly disallowed the amounts claimed as cost to Colorado of certain gas purchase and sale contracts, which amounts were also found to be intercompany profits.

2. Whether the Commission's findings with respect to Canadian's gas reserves are supported by substantial evidence.

3. Whether the allocations of cost made by the Commission between petitioners' intrastate and direct industrial sales, and their interstate sales for resale, are appropriate.

4. Whether the rates prescribed for petitioners are confiscatory.

STATUTES INVOLVED

The applicable portions of the Natural Gas Act are set forth in the Appendix, *infra*, pp. 23–27.

STATEMENT

The proceedings before the Commission arose out of a complaint filed on December 22, 1938, by the City and County of Denver, Colorado, against Public Service Company of Colorado, and petitioners, Colorado Interstate Gas Company ("Colorado") and Canadian River Gas Company ("Canadian"), alleging that the rates charged by Colorado for natural gas purchased from Canadian and sold to Public Service Company of Colorado for resale in Denver were excessive, unreasonable, unjust, and discriminatory (R. I. 302). On January 9, 1939, the Public Service Commission of Wyoming filed a complaint with the Commission alleging that the rates of Canadian and Colorado for natural gas sold to Colorado-Wyoming Gas Company for resale to Cheyenne Light, Fuel and Power Company, which distributes such gas in Cheyenne, Wyoming, were unjust, unreasonable, and discriminatory (R. I, 333). The Commission,

on its own motion, instituted an investigation, on March 14, 1939, of all interstate wholesale rates and charges of petitioners, Colorado and Canadian, and of Colorado-Wyoming Gas Company (R. I, 317).[1]

Hearings on the complaints and the investigation were consolidated by the Commission, begun on October 28, 1940, and held on 102 days (R. I, 141). After submission of briefs, the Commission, on March 18, 1942, issued its opinion and orders here under review, finding that the interstate wholesale rates of Canadian were excessive by $561,000 per year and those of Colorado by $2,065,000 per year, and requiring petitioners to reduce such rates accordingly (R. I, 185–192).[2] The following facts, found by the Commission, are clearly established by the evidence:

The Petitioners.—Canadian and Colorado were incorporated and financed, and are operated pursuant to an agreement dated April 5, 1927, between

[1] On April 12, 1939, petitioners filed with the Commission a joint application praying for a stay of the order instituting the investigation, which the Commission denied by order dated May 9, 1939. A petition to review the latter order was dismissed by the Circuit Court of Appeals for the Tenth Circuit in *Canadian River Gas Company, et al.* v. *Federal Power Commission*, 110 F. (2d) 350, rehearing denied, 113 F. (2d) 1010, certiorari denied, 311 U. S. 693.

[2] Canadian's reduction includes $551,000 which is applicable to its sales to Colorado, and the portion of this amount allocated to Colorado's interstate sales for resale is included in the $2,065,000 reduction prescribed for Colorado (R. I, 176, 177).

Southwestern Development Company ("Southwestern"), Standard Oil Company (N. J.) ("Standard") and Cities Service Company ("Cities Service") (R. I, 381–401). By this agreement Southwestern, Standard and Cities Service pooled their respective gas reserves, finances and distribution markets, to bring natural gas from the Panhandle field to the Denver and Pueblo, Colorado, markets. This pooling was effected in the following manner:

Southwestern, through a wholly owned subsidiary, Amarillo Oil Company ("Amarillo"), controlled certain gas leaseholds and producing properties in the Texas Panhandle field, which Southwestern agreed to transfer to a new subsidiary (Canadian) which it would organize for that purpose (R. I, 381–382). Standard agreed to form a new corporation (Colorado) and to finance its construction of pipeline facilities to connect with and transport gas from Canadian's facilities to the Denver market and intermediate points including Pueblo (R. I. 385). Cities Service was to procure franchises through its subsidiaries under which such natural gas could be distributed in Denver and Pueblo (R. I, 391). It was agreed that Canadian would sell gas to Colorado at "cost" for at least 20 years from 1928, such "cost" to include amortization of all of Canadian's indebtedness over the twenty-year period and to be decreased by any profits Canadian might obtain from other sources, including local

sales permitted by Colorado (R. I, 392; R. II, 719–732). Canadian, under the "cost" contract, would have nothing available for dividends on its common stock during the first 20 years (R. III, 1436) and so long thereafter as Colorado might choose to purchase its gas at "cost" (R. III, 1435).

Pursuant to the agreement, Southwestern organized Canadian to which were transferred the gas leaseholds and producing properties of Amarillo, also a wholly-owned subsidiary of Southwestern. The cash consideration for this transfer was $5,000,000, stipulated in the tripartite agreement, and advanced by Standard for this purpose at 6% interest (R. I, 392, R. V, 2936–2937).[3] To repay the advance and to finance the acquisition and construction of additional facilities, Canadian issued $11,000,000 of twenty-year 6% sinking fund bonds, which Colorado purchased from the proceeds of its $19,200,000 of twenty-year 6% sinking fund bonds, which, in turn, were purchased by Standard, in accordance with the 1927 agreement (R. I, 496).

As had been further agreed, Standard organized Colorado with $2,000,000 par value of 6% preferred stock and 1,250,000 shares of no par common stock, and paid $1,000,000 in cash for half of the preferred stock and another $1,000,000 in

[3] As hereinafter discussed, *infra*, pp. 12–13, the Commission, in determining Canadian's rate base, disallowed the $3,249,030 portion of this amount which was in excess of the $1,750,970 cost of such properties to Amarillo and its affiliates.

cash for its portion (42½%) of Colorado's common stock (R. II, 626). Southwestern (as nominee of Canadian) also received half of Colorado's preferred stock and 42½% of the common stock (R. II, 626), the remaining 15% of the common stock being issued to Cities Service (R. I, 395–396, R. II, 627). It was implicit in the tripartite agreement, therefore, that Southwestern, Standard, and Cities Service would receive their profits from the operations of the enterprise by way of dividends on Colorado's stock.

The preferred stock was recorded on Colorado's books at the par value of $2,000,000 and the no par common stock (1,250,000 shares) was recorded at $2,352,941.17, based on what Standard had paid in cash for its 42½% (531,250 shares) of such stock (R. II, 627). These entries were balanced by charges to Colorado's asset accounts totalling $4,352,941.17 (R. II, 626, 627; R. III, 1427).[4]

The Commission's Orders.—In requiring Canadian to reduce its interstate wholesale rates by $561,000 annually, the Commission found the actual legitimate cost of the Company's plant at December 31, 1939, to be $10,784,464 (R. I, 186).

[4] As hereinafter discussed, *infra*, pp. 11–12, the Commission, in determining Colorado's rate base, disallowed the $2,352,941.17 portion of this amount (R. I, 152), which was in excess of the $2,000,000 which Standard paid in cash for its share of Colorado's preferred and common stock.

From this amount it deducted $2,134,629 for accrued depreciation and depletion as of that date, and added $150,738 for working capital and $571,923 covering gross plant additions to December 31, 1941. This resulted in a rate base of $9,372,496, which was rounded to $9,375,000 (R. I, 187). In requiring Colorado to reduce its interstate wholesale rates by $2,065,000 annually, the Commission found the actual legitimate cost of the company's plant at December 31, 1939, to be $11,879,409 (R. I, 190). From this amount it deducted $2,793,410 for accrued depreciation and amortization as of that date; and added $109,065 for working capital and $337,000 covering gross plant additions to December 31, 1941. This resulted in a rate base of $9,532,064, which was rounded to $9,535,000 (R. I, 190). Petitioners' estimates of reproduction cost were considered by the Commission and were found to be too conjectural to have probative value (R. I, 148). The Commission further found that actual costs, which could be readily determined from petitioners' accounting records, represented the best and only reliable evidence as to rate base (R. I, 148).

The Commission allowed a 6½% return on the rate base of each petitioner, which return it found to be "fair and reasonable" (R. I, 187, 190), noting that Colorado in 1940 had refinanced its outstanding bonded indebtedness at an interest rate of 2¾% (R. I, 173). With certain minor

exceptions, the Commission allowed each petitioner the taxes, operating expenses, exploration and development costs, shown by its books for the test year, 1939, adjusted to reflect accrual accounting (R. I, 166–169; R. VI, 3387). The Commission also allowed amounts to amortize rate case expenses over a five-year period (R. I, 166, 168). Annual allowances for depreciation, depletion and amortization were determined on the basis of the economic service lives of petitioners' properties,[5] such allowances being consistent with the amounts deducted for accrued depreciation, depletion and amortization in arriving at the rate bases (R. I, 160, 156). The Commission found that, based on the present and expected future rate of production, Canadian's gas reserves would last 53 years after 1939 (R. I, 159), and rejected, as not supported by any reliable evidence, petitioners' contentions that the enterprise would have to be abandoned by 1956 (R. I, 160).

In arriving at the amount of the reductions in the interstate wholesale rates, the Commission made an allocation of the cost of service of each petitioner, including in such cost the fair return on the rate base, and determined the excess of revenues over costs for intrastate sales, direct industrial sales, and interstate sales for resale (R. I, 176–177).

[5] Depletion of Canadian's production properties was computed by the unit-of-production method based on its recoverable gas reserves (R. I, 160).

The petitioners, on April 14, 1942, applied for a rehearing and stay of the Commission's orders (R. I, 203, 238, 277, 284), and on May 13, 1942, the Commission issued its supplemental opinion and orders denying such petitions (R. I, 296–301). Thereafter, petitions for review were filed in the Circuit Court of Appeals for the Tenth Circuit, which heard argument on September 14–15, 1943, handed down its opinion on May 16, 1944, and entered its judgment on July 8, 1944, affirming the Commission's orders (R. VIII, 5065–5094).

ARGUMENT

In any rate proceeding, and particularly in cases such as these which involve an enterprise with unusually complicated intercompany arrangements, errors can readily be alleged and controversies arise in respect of many of the adjustments which the Commission may be compelled to make in determining just and reasonable rates. We submit that the only issues posed by the numerous questions raised in the petitions which are of significance at this stage of the proceedings are the Commission's elimination of intercompany profits from the rate bases, the sufficiency of the evidence to support the findings as to gas reserves, the method of allocation, and the question of confiscation.

1. *The Commission properly eliminated the intercompany profits from the rate bases of Canadian and Colorado.*—As has already been noted,

Southwestern, Cities Service and Standard, acting under the 1927 agreement, pooled their respective gas reserves, distribution markets and finances, and agreed upon an apportionment of the profits of the joint enterprise. Standard paid $2,000,000 in cash for its half of Colorado's preferred stock and its 42½% of the common stock (R. II, 626). This equity capital was reflected in Colorado's rate base and accordingly allowed by the Commission. But neither Southwestern nor Cities Service paid any cash consideration for their portions of Colorado's stocks (R. II, 628). The preferred stock (50%) and the common stock (42½%) issued to Southwestern was recorded on Colorado's books at $2,000,000 and the common stock (15%) issued to Cities Service was recorded at $352,941.17 (R. II, 627). The book value thus assigned to this stock was based upon what Standard had paid in cash for its portion (R. II, 627), and was balanced by a $2,352,941.17 charge to Colorado's plant accounts (R. III, 1749). This charge, which was recorded as "Cost of Contracts" (R. II, 628), did not represent any investment of cash or tangible property in the enterprise and was properly disallowed by the Commission, which realistically recognized it as promoters' profit. Cf. *Northwestern Electric Company* v. *Federal Power Commission*, 321 U. S. 119. Moreover, any arm's length bargaining between the parties to the 1927 agreement was

limited to the division of profits to be effected through the distribution of Colorado's stock. *Niagara Falls Power Company* v. *Federal Power Commission*, 137 F. (2d) 787, 793–794 (C. C. A. 2), certiorari denied, 320 U. S. 792.

Similarly, with respect to the $5,000,000 of cash allotted to Southwestern under the agreement, the court below properly affirmed the Commission's disallowance of the $3,249,030 portion thereof which was found to be in excess of actual cost to Amarillo and its affiliates (R. I, 150). There is no merit in Canadian's contentions that Southwestern's transfer of these properties, in accordance with the 1927 agreement, from one wholly-owned subsidiary (Amarillo) to another (Canadian), constituted a purchase and sale, or that the $5,000,000 represented the purchase price agreed upon "after prolonged arm's-length bargaining" (Can. Pet. 18). On the contrary, the record shows that this allotment of cash was made to Southwestern because of its poor financial condition (R. I, 520, 559) and was as much a part of Southwestern's share in the profits of the joint enterprise as its allotment of Colorado's stock (R. I, 392). The $5,000,000 was actually paid by Standard directly to Prairie Oil and Gas Company, a holding company affiliated with Southwestern, and was used by Prairie in discharging certain obligations of Southwestern and Amarillo, in advancing $1,000,000 to West

Texas Gas Company, and in furnishing $310,000 to Amarillo (R. V, 2937, 2932–35). Canadian was not formed until after the $5,000,000 had been paid, and, significantly, none of the companies involved paid any income tax as a result of the so-called "sale" (R. V, 2936, 2638). The intercompany profit which disappeared on the consolidated tax return of Southwestern and its subsidiaries, including Amarillo and Canadian, "is too lacking in substance to be treated as an actual cost." *Pennsylvania Power & Light Company* v. *Federal Power Commission,* 139 F. (2d) 445, 450 (C. C. A. 3), certiorari denied, 321 U. S. 798. Moreover, until 1939, Canadian carried the intercompany profit on its books as "Appreciation".[6] (R. V, 2630–2632).

The "no profits to affiliates" rule, which the Commission here applied, precludes any allowance in the rate bases for the items in question. The propriety, as well as the constitutionality, of the Commission's action in enforcing the rule has been before the courts on numerous occasions, and has uniformly been upheld. *Alabama Power Company* v. *McNinch,* 94 F. (2d) 601, 608, 615, 618 (App. D. C.); *Alabama Power Company* v. *Federal Power Commission,* 128 F. (2d) 280, 284

[6] The Commission's Uniform System of Accounts under the Natural Gas Act (p. 17), like that prescribed under the Federal Power Act (p. 19), does not permit the recording of appreciation in the plant accounts. *Northwestern Electric Company* v. *Federal Power Commission,* 321 U. S. 119.

(App. D. C.), certiorari denied, 317 U. S. 652; *Alabama Power Company* v. *Federal Power Commission*, 134 F. (2d) 602, 609 (C. C. A. 5); *Puget Sound Power & Light Co.* v. *Federal Power Commission*, 137 F. (2d) 701, 703 (App. D. C.); *Niagara Falls Power Company* v. *Federal Power Commission*, 137 F. (2d) 787, 793–794 (C. C. A. 2), certiorari denied, 320 U. S. 792; *Pennsylvania Power & Light Co.* v. *Federal Power Commission*, 139 F. (2d) 445, 450 (C. C. A. 3), certiorari denied, 321 U. S. 798.

2. *The Commission's allowances for depreciation and depletion are adequate.*—The principal controversy in respect to depreciation and depletion arises from the Commission's finding that Canadian's gas reserves have an estimated life of 53 years from 1939. Canadian contends that because of drainage by other wells in the Panhandle field, its reserves will be exhausted within 27 years from 1939, which it now claims to be the maximum life of the Panhandle field as a whole. Canadian further contends that the Commission ignored the question of drainage and thus erred as a matter of law (Pet. 36–37). We submit that these contentions are without merit.

The Commission is entitled to evaluate the evidence and to draw rational inferences therefrom, and the finding by the Commission that Canadian's gas reserves had a potential life of 53 years clearly has ample support in the record.

The Commission's expert calculated the recoverable reserves by the "pressure decline method," the soundness of which was recognized by this Court in *Dayton Power and Light Company* v. *Commission,* 292 U. S. 290, 306, and testified that on an assumed annual withdrawal of fifty billion cubic feet, Canadian's remaining reserves would last 73.7 years (R. VI, 3628–3629). The Commission considered Canadian's objections to this estimate, which included the contention that "account was not taken of the migration of gas under Canadian's acreage," and noted that theoretically such migration is automatically accounted for under the "pressure decline method" and is actually accounted for if the iso-baric maps are properly drawn (R. I, 158–159).

As the lower court properly held, "it nowhere appears that the Commission failed appropriately to weigh" the "existing volume, pressure differentials and consequent drainage, and other recovery factors" (R. VIII, 5091). The lower court also observed that the determination of Canadian's recoverable reserves necessarily involved "specialized and technical factors," as to which the informed judgment of the Commission, when supported by substantial evidence, should be controlling [Secs. 9 (a) and 19 (b) of the Act, *infra,* pp. 25–27] (R. VIII, 5092).

Moreover, as pointed out by the Commission in its opinion, "it makes little difference whether the

service life principle based on the longer expected life, or the company's amortization principle based upon a 1956 expiration, is adopted. The net results as to excess earnings are substantially the same, provided consistency is maintained in computing the annual expense and the accrued depreciation and depletion reserve requirement" (R. I, 160). As the lower court properly held, "there is no basis in this record on which it can be concluded that the determination of depreciation in the manner adopted by the Commission will result in any of these orders in its entirety causing a failure to restore the capital investment at the end of the term, and therefore no deprivation of property is involved" (R. VIII, 5089).

Certain incidental contentions which petitioners advance in this connection may be dealt with briefly. Canadian contends (Pet. 25) that it will be required to invest $6,500,000 in future replacements and Colorado contends (Pet. 23) that the depreciation allowance made to it will be inadequate to amortize future replacements. As this Court ruled in *Federal Power Commission* v. *Natural Gas Pipeline Company*, 315 U. S. 575, 587, n. 5 "the refusal to include in the rate base capital expenditures not yet made can not involve confiscation." It follows that amortization of such expenditures is likewise not required.

3. *The cost allocations made by the Commission are appropriate.*—Both Canadian and Colorado contend that the allocations of costs which the Commission made between regulable and non-

regulable sales did not comply with the jurisdictional requirements in Section 1 (b) of the Act (Appendix, *infra*, p. 23). Canadian's principal objection is that the Commission had no jurisdiction to reduce its charges to Colorado for gas which the latter resells directly to industrial customers (Pet. 27). An adequate answer to Canadian's view that such reduction "serves no useful purpose" (Pet. 39), is that the Act specifically applies to its interstate sales for resale "for domestic, commercial, *industrial,* or any other use" (Sec. 1 (b)). Moreover, the absence of jurisdiction over Colorado's direct industrial rates was recognized by the Commission, and only that portion of the annual reduction in Canadian's rates to Colorado properly allocable to Colorado's interstate sales for resale was reflected in the annual reduction prescribed for Colorado (R. I, 176, 177).

Colorado advances the contention (Pet. 23–30), in which Canadian joins (Pet. 40), that the Commission instead of making a determination of costs properly chargeable against the regulable sales, was required to make an allocation of property (Colo. Pet. 11). We submit that this contention is without merit. The decisions cited by Colorado (Pet. 24–28) cannot be read as precluding a federal administrative judgment as to the best method of allocation under the circumstances of a particular case. The Natural Gas Act does not prescribe any method of allocation, or even require

that any formal allocation be made. As the Commission noted, Canadian and Colorado failed to make a complete presentation of their entire operations "broken down between jurisdictional and non-jurisdictional operations." The Commission found that "all that can be accomplished by an allocation of physical properties can be attained by allocating costs including the return" (R. I, 175). This method, which the Commission termed "by far the most practical and business-like" (R. I, 175), was described in its opinion as follows: "* * * costs are divided essentially into two groups, fixed and variable. Fixed costs are largely joint costs which do not vary with volume of sales. The total amount of such costs are largely proportional to the maximum demand on the system or system capacity. Accordingly, these costs have been allocated basically in proportion to each customer's responsibility for the peak day demand. Variable costs are largely those that vary proportional to output or volume of sale. Accordingly, these costs have been allocated in proportion to volume of gas purchased by each customer." (R. I, 175-176). We submit that this method of allocation was, as the lower court observed, "a working one suitably adapted to the particular circumstances" (R. VIII, 5087).[7]

[7] Canadian's contention that by finding the cost of its facilities employed in the production and gathering of natural gas the Commission exceeded its jurisdiction under Section 1 (b) of the Act is without merit. Canadian's sales at wholesale in

4. *The Commission's orders do not involve confiscation.*—Canadian contends that any reduction in its rates is confiscatory because its contractual obligation to sell gas to Colorado at "cost" precludes any possibility of its making a profit under its existing rates (Pet. 19–20). But the alleged "cost" under the contract includes the amortization of Canadian's entire indebtedness [representing all its capital except its common stock, issued for $1.00 (R. II, 688)] over a twenty-year period, which is admittedly much less than the life of the enterprise. Thus, to the extent that such amortization exceeds proper depreciation and depletion,[3] Canadian is necessarily making substantial profits on which it has been required to pay an income tax (R. III, 1745). The fact that Colorado did not obligate itself under the contract to purchase Canadian's gas beyond the twenty-year period, and thus made it desirable for Canadian to amortize all its costs within that period, is no longer of any

---

interstate commerce are subject to regulation under the Act. The Commission was required to fix rates that are just and reasonable. This it would be unable to do if it were not in a position to ascertain the rate base upon which to determine the reasonableness of the rates charged and, in order to determine the rate base, it was necessary to consider the production and gathering facilities. A similar argument was summarily rejected by this Court in *Federal Power Commission* v. *Hope Natural Gas Company*, 320 U. S. 591, 614, n. 25.

[3] At the end of the test year, 1939, Canadian's "cost" of gas under the contract had included amortization of debt totaling $9,073,565 (R. VI, 3581). The Commission deducted $2,134,629 for depreciation and depletion in finding Canadian's rate base (R. I, 161).

significance, since neither Colorado nor Canadian can abandon its interstate facilities or service without the prior approval of the Commission. Sec. 7 (b)). The contractual prohibition against Canadian's sale of gas without the consent of Colorado is likewise subject to the Commission's authority to require extensions of service (Sec. 7 (a)). Canadian complains, however, that it is left with the obligation of the contract without the ability to collect the income it will need thereunder (Pet. 33). The answer to this contention is to be found in *Chicago, B. & Q. R. R. Co.* v. *Iowa*, 94 U. S. 155, 162–163, where this Court held in a rate proceeding, that it was immaterial that the company, prior to regulation, "had pledged its income as security for the payment of debts incurred, and had leased its road to a tenant that relied upon the earnings for the means of paying the agreed rent."

Nor does the financial history of the enterprise sustain the validity of a "confiscation" argument on the part of Colorado or Canadian. All of the properties of both Colorado or Canadian were acquired or constructed with the proceeds of loans, with the exception of $2,000,000 of equity capital invested by Standard. Colorado by December 31, 1939, had paid dividends totalling $8,005,000 (R. III, 1691) and accumulated a depreciation reserve of $4,994,352.35, a reserve for amortization of contracts of $1,471,546.15, and an undistributed surplus of $2,479,133.92 (R. III,

1711). Moreover, by that date, Colorado's outstanding debt had been reduced to $8,865,000 represented by bonds (R. III, 1711), the interest on which was reduced to 2¾% in 1940 (R. II, 632). Canadian's financial condition is comparable. Its claimed "total cash investment" in plant of $15,220,744 at December 31, 1941, had been recovered, except for $4,368,703, in the "cost" of gas by December 31, 1941 (R. VI, 3581). The Commission's allowance of $838,157 for annual depreciation, depletion and return on plant (R. I, 171, 173), thus represents approximately 20% of Canadian's unrecovered claimed investment. We submit that under these circumstances there is no confiscation. See *Federal Power Commission* v. *Natural Gas Pipeline Company*, 315 U. S. 575, 578–579, and *Federal Power Commission* v. *Hope Natural Gas Company*, 320 U. S. 591, 603–606.[9]

---

[9] Canadian's objections to the amount of revenues found available for return are similarly predicated upon the "cost" contract (Pet. 22–23). Contrary to the implication in the petition (p. 23), the Commission's accountant restated Canadian's revenues, as well as its expenses, during the test year on an accrual basis (R. VI, 3387). Canadian's contention that its revenues were overstated is accordingly based on the provision in the "cost" contract that any reduction in Canadian's costs necessarily reduces its rates to Colorado. Similarly, the $13,056.24 adjustment for profits to an affiliate in connection with extraction of gasoline (Pet. 23) was allocated exclusively to sales to Amarillo Oil Company at the wells (R. IV, 2317, 2382), and these rates were not affected by the Commission's order. Canadian's contentions with respect to the $26,350 increase in the Texas gross production

CONCLUSION

The decision below is correct and there is no conflict. We respectfully submit that the petitions for writs of certiorari should be denied.

taxes (Pet. 24) were first raised in its brief in the court below. This amount, in any event, is more than offset by the Commission's allowance of $66,403 for Federal income tax for which there appeared to be no liability if Canadian's return were limited to that found fair and reasonable by the Commission (R. I, 297).

APPENDIX

The pertinent provisions of the Natural Gas Act of 1938, c. 556, 52 Stat. 821 (15 U. S. C. 717 *et seq.*), are as follows:

SEC. 1. (b) The provisions of this Act shall apply to the transportation of natural gas in interstate commerce, to the sale in interstate commerce of natural gas for resale for ultimate public consumption for domestic, commercial, industrial, or any other use, and to natural-gas companies engaged in such transportation or sale, but shall not apply to any other transportation or sale of natural gas or to the local distribution of natural gas or to the facilities used for such distribution or to the production or gathering of natural gas.

SEC. 5. (a) Whenever the Commission, after a hearing had upon its own motion or upon complaint of any State, municipality, State commission, or gas distributing company, shall find that any rate, charge, or classification demanded, observed, charged, or collected by any natural-gas company in connection with any transportation or sale of natural gas, subject to the jurisdiction of the Commission, or that any rule, regulation, practice, or contract affecting such rate, charge, or classification is unjust, unreasonable, unduly discriminatory, or preferential, the Commission shall determine the just and reasonable rate, charge, classification, rule, regulation, practice, or contract to be thereafter observed and in force, and shall fix the same by order: *Provided, however,*

That the Commission shall have no power to order any increase in any rate contained in the currently effective schedule of such natural gas company on file with the Commission, unless such increase is in accordance with a new schedule filed by such natural gas company; but the Commission may order a decrease where existing rates are unjust, unduly discriminatory, preferential, otherwise unlawful, or are not the lowest reasonable rates.

SEC. 6. (a) The Commission may investigate and ascertain the actual legitimate cost of the property of every natural-gas company, the depreciation therein, and when found necessary for rate-making purposes, other facts which bear on the determination of such cost or depreciation and the fair value of such property.

SEC. 7. (a) Whenever the Commission, after notice and opportunity for hearing, finds such action necessary or desirable in the public interest, it may by order direct a natural-gas company to extend or improve its transportation facilities, to establish physical connection of its transportation facilities with the facilities of, and sell natural gas to, any person or municipality engaged or legally authorized to engage in the local distribution of natural or artificial gas to the public, and for such purpose to extend its transportation facilities to communities immediately adjacent to such facilities or to territory served by such natural-gas company, if the Commission finds that no undue burden will be placed upon such natural-gas company thereby: *Provided*, That the Commission shall have no authority to compel the enlargement of transportation facilities for such purposes,

or to compel such natural-gas company to establish physical connection or sell natural gas when to do so would impair its ability to render adequate service to its customers.

(b) No natural-gas company shall abandon all or any portion of its facilities subject to the jurisdiction of the Commission, or any service rendered by means of such facilities, without the permission and approval of the Commission first had and obtained, after due hearing, and a finding by the Commission that the available supply of natural gas is depleted to the extent that the continuance of service is unwarranted, or that the present or future public convenience or necessity permit such abandonment.

SEC. 9. (a) The Commission may, after hearing, require natural-gas companies to carry proper and adequate depreciation and amortization accounts in accordance with such rules, regulations, and forms of account as the Commission may prescribe. The Commission may from time to time ascertain and determine, and by order fix, the proper and adequate rates of depreciation and amortization of the several classes of property of each natural-gas company used or useful in the production, transportation, or sale of natural gas. Each natural-gas company shall conform its depreciation and amortization accounts to the rates so ascertained, determined, and fixed. No natural-gas company subject to the jurisdiction of the Commission shall charge to operating expenses any depreciation or amortization charges on classes of property other than those prescribed by the Commission, or charge with respect to any class of property a per-

centage of depreciation or amortization other than that prescribed therefor by the Commission. No such natural-gas company shall in any case include in any form under its operating or other expenses any depreciation, amortization, or other charge or expenditure included elsewhere as a depreciation or amortization charge or otherwise under its operating or other expenses. Nothing in this section shall limit the power of a State commission to determine in the exercise of its jurisdiction, with respect to any natural-gas company, the percentage rates of depreciation or amortization to be allowed, as to any class of property of such natural-gas company, or the composite depreciation or amortization rate, for the purpose of determining rates or charges.

SEC. 19. (b) Any party to a proceeding under this Act aggrieved by an order issued by the Commission in such proceeding may obtain a review of such order in the circuit court of appeals of the United States for any circuit wherein the natural-gas company to which the order relates is located or has its principal place of business, or in the United States Court of Appeals for the District of Columbia, by filing in such court, within sixty days after the order of the Commission upon the application for rehearing, a written petition praying that the order of the Commission be modified or set aside in whole or in part. * * *. No objection to the order of the Commission shall be considered by the court unless such objection shall have been urged before the Commission in the application for rehearing unless there is reasonable ground for failure

so to do. The finding of the Commission as to the facts, if supported by substantial evidence, shall be conclusive. * * *. The judgment and decree of the court, affirming, modifying, or setting aside, in whole of in part, any such order of the Commission, shall be final, subject to review by the Supreme Court of the United States upon certiorari or certification as provided in sections 239 and 240 of the Judicial Code, as amended (U. S. C., title 28, secs. 346 and 347).

Jurisdiction	2
Questions presented	3
Statutes involved	6
Statement	6
Summary of argument	13
Argument:	
I. The Commission did not exceed its jurisdiction with respect to Canadian's producing and gathering facilities	17
II. The Commission properly declined to allow Canadian the alleged market value of its leaseholds or a "commodity" or field price for its gas	29
III. In determining the actual legitimate cost of Canadian's properties, the Commission properly disallowed amounts claimed by Canadian for leaseholds in excess of the cost of such leaseholds to Amarillo and its affiliates	37
A. The properties were transferred between wholly owned subsidiaries of Southwestern without any additional investment	38
B. From the standpoint of Standard and Cities Service the $5,000,000 was an advance to Southwestern of a portion of its share in the profits of the joint enterprise	46
IV. The Commission properly determined the amount of the reductions in petitioners' regulated rates by an allocation of costs between regulable and nonregulable sales	54
A. The Commission has administrative discretion to adopt any method of allocation which is reasonable and appropriate	54
B. The Commission's allocation of cost of service was reasonable and appropriate	57
C. Petitioner's objections to the Commission's method of allocation of cost of service are without merit	64
1. Priority of service	65
2. Transmission line as a unit	68
3. System peak day	74
4. Adequacy of findings	76

In the Supreme Court of the United States

OCTOBER TERM, 1944

Nos. 379 and 380

COLORADO INTERSTATE GAS COMPANY, A CORPORATION, PETITIONER

v.

FEDERAL POWER COMMISSION, CITY AND COUNTY OF DENVER, COLORADO, PUBLIC SERVICE COMMISSION OF WYOMING, COLORADO-WYOMING GAS COMPANY, PUBLIC SERVICE COMPANY OF COLORADO, AND CANADIAN RIVER GAS COMPANY

CANADIAN RIVER GAS COMPANY, A CORPORATION, PETITIONER

v.

FEDERAL POWER COMMISSION, CITY AND COUNTY OF DENVER, COLORADO, PUBLIC SERVICE COMMISSION OF WYOMING, COLORADO-WYOMING GAS COMPANY, PUBLIC SERVICE COMPANY OF COLORADO, AND COLORADO INTERSTATE GAS COMPANY

ON WRITS OF CERTIORARI TO THE UNITED STATES CIRCUIT COURT OF APPEALS FOR THE TENTH CIRCUIT

BRIEF FOR THE FEDERAL POWER COMMISSION, CITY AND COUNTY OF DENVER, COLORADO, AND PUBLIC SERVICE COMMISSION OF WYOMING[1]

OPINIONS BELOW

The opinion and orders of the Federal Power Commission (R. I, 140–192) are reported in 43 P. U. R. (N. S.) 205. The opinion of the circuit court of appeals (R. VIII, 5066–5094) is reported in 142 F. (2d) 943.

JURISDICTION

The judgment of the circuit court of appeals was entered July 8, 1944. (R. VIII, 5094). The petitions for writs of certiorari were filed on August 22, 1944. Writs of certiorari were granted on November 13, 1944, limited to Questions Nos. 5 and 6 presented in the petition in No. 379 and to Question No. 8 presented in the petition in No. 380. By order entered January 2, 1945, the scope of review in No. 380 was enlarged to include Questions Nos. 1, 2 and 3 presented in the petition. Jurisdiction of this Court

[1] Although Nos. 379 and 380 present for review two separate orders of the Commission, those orders were entered in a consolidated proceeding instituted upon complaints filed with respect to both companies. The cases were heard on a single record both before the Commission and before the court below, and were disposed of in a single opinion in that court. Moreover, the issue to which review was limited by the original orders of this Court granting certiorari is common to both cases. For these reasons, it has appeared appropriate to deal with both cases in a single brief.

rests upon Section 19 (b) of the Natural Gas Act, and Section 240 (a) of the Judicial Code, as amended by the Act of February 13, 1925.

QUESTIONS PRESENTED

The questions as to which a writ of certiorari was granted in No. 379, as stated in the petition in that case, are as follows:

> "5. Whether consistently with the requirements of the Fifth Amendment to the Constitution of the United States and the Natural Gas Act the Commission could determine reasonable rates for gas sold for resale in interstate commerce without making a separation or allocation of the property of Canadian and petitioner which, in this case, is used in making intrastate sales in Texas and interstate sale of both resale and direct sale gas, the Commission having no jurisdiction over intrastate sales or over direct sales in interstate commerce to industrial consumers.
>
> "6. Whether the Commission's substitute method of allocation of cost of service which results in burdening non-regulable gas with costs actually chargeable against regulable gas violates the Fifth Amendment to the Constitution of the United States and the Natural Gas Act."

The questions as to which a writ of certiorari was granted in No. 380, as stated in the petition in that case, are as follows:

"1. Whether the Circuit Court, after correctly holding that the Commission has no rate regulatory jurisdiction over Canadian's production and gathering properties, facilities and business, erroneously concluded and ruled that the Commission in this case did not exercise such prohibited jurisdiction."

"2. Whether, even assuming, *arguendo*, that the Commission has rate regulatory jurisdiction over Canadian's production and gathering properties, facilities and business, the Commission can, consistently with the Fifth Amendment to the Constitution of the United States, the requirements of the Act, and the decisions of this Court in the Natural Gas Pipeline, Hope and other cases, limit Canadian generally to a return only on the 'wildcat' or original cost of its gas leaseholds to predecessor companies prior to discovery and development over 20 years ago, to the exclusion of all evidence of value, market or otherwise, the result of this procedure being, among other things, the inclusion in the Commission's rate base of a substantial block of Canadian's most valuable leaseholds at zero valuation and a still larger block of valuable leaseholds at only 10¢ per acre valuation."

"3. Whether, even assuming, *arguendo*, that the Commission has rate regulatory jurisdiction over Canadian's production and gathering properties, facilities and business, and further assuming, *arguendo*, that it is proper in this case to include Canadian's leaseholds and wells in the rate base on the basis of original cost, the Commission can, consistently with the Fifth Amendment to the Constitution of the United States, the requirements of the Act, and the principles announced by this Court in the Natural Gas Pipeline, Hope and other cases, disallow and eliminate more than $3,000,000, plus interest during construction paid thereon, from the amount actually invested by Canadian in its original acquisition of production properties in about 1928 solely upon the ground that the sum so eliminated allegedly represented a profit between affiliated companies, and, therefore, formed no proper part of the cost of said properties, where the Record clearly demonstrates that the transaction resulting in the acquisition of said properties was not between affiliates and that the price paid therefor was not excessive."

"8. Whether the Commission can, consistently with the Fifth Amendment to the Constitution of the United States and the provisions of the Act, reduce the rates and charges of Canadian on that part of its

natural gas sales to Colorado Interstate which is not sold by the latter for ultimate distribution to the public but is sold by it directly to its industrial customers; furthermore, independent of the above question, whether the Commission erred in making no separation or allocation as between Canadian's properties devoted to intrastate sales in Texas and its properties devoted to interstate sales, or as between the properties of Canadian and the properties of Colorado Interstate, and in using in lieu thereof a substitute method of allocation of cost of service which results in burdening non-regulable gas with costs actually chargeable against regulable gas, in violation of the Fifth Amendment to the Constitution of the United States and the Act."

STATUTES INVOLVED

The applicable portions of the Natural Gas Act are set forth in Appendix A, *infra*, pp. 89–104.

STATEMENT

The proceedings before the Commission arose out of a complaint filed on December 22, 1938, by the City and County of Denver, Colorado, against Public Service Company of Colorado, and petitioners, Colorado Interstate Gas Company ("Colorado") and Canadian River Gas Company ("Canadian"), alleging that the rates charged

by Colorado for natural gas purchased from Canadian and sold to Public Service Company of Colorado for resale in Denver were excessive, unreasonable, unjust, and discriminatory (R. I, 302). On January 9, 1939, the Public Service Commission of Wyoming filed a complaint with the Commission alleging that the rates of Canadian and Colorado for natural gas sold to Colorado-Wyoming Gas Company for resale to Cheyenne Light, Fuel and Power Company, which distributes such gas in Cheyenne, Wyoming, were unjust, unreasonable, and discriminatory (R. I, 333). The Commission, on its own motion, instituted an investigation, on March 14, 1939, of all interstate wholesale rates and charges of petitioners, Colorado and Canadian, and of Colorado-Wyoming Gas Company (R. I, 317).

Hearings on the complaints and the investigation were consolidated by the Commission, begun on October 28, 1940, and held on 102 days (R. I, 141). After submission of briefs, the Commission, on March 18, 1942, issued its opinion and

---

On April 12, 1939, petitioners filed with the Commission a joint application praying for a stay of the order instituting the investigation, which the Commission denied by order dated May 9, 1939. A petition to review the latter order was dismissed by the Circuit Court of Appeals for the Tenth Circuit in *Canadian River Gas Company, et al.* v. *Federal Power Commission*, 110 F. (2d) 350, rehearing denied, 113 F. (2d) 1010, certiorari denied, 311 U. S. 693.

orders here under review, finding that the interstate wholesale rates of Canadian were excessive by $561,000 per year and those of Colorado by $2,065,000 per year, and requiring petitioners to reduce such rates accordingly (R. I, 185–192).[2] The following facts, found by the Commission, are clearly established by the evidence:

The Petitioners.—Canadian and Colorado were incorporated and financed, and are operated, pursuant to an agreement dated April 5, 1927, between Southwestern Development Company ("Southwestern"), Standard Oil Company (N. J.) ("Standard") and Cities Service Company ("Cities Service") (R. I, 381–401). By this agreement Southwestern, Standard and Cities Service pooled their respective gas reserves, finances and distribution markets, to bring natural gas from the Panhandle field to the Denver and Pueblo, Colorado, markets. This pooling was effected in the following manner:

Southwestern, through a wholly owned subsidiary, Amarillo Oil Company ("Amarillo"), controlled certain gas leaseholds and producing properties in the Texas Panhandle field, which Southwestern agreed to transfer to a new sub-

[2] Canadian's reduction includes $551,000 which is applicable to its sales to Colorado, and the portion of this amount allocated to Colorado's interstate sales for resale is included in the $2,065,000 reduction prescribed for Colorado (R. I, 176, 177).

sidiary (Canadian) which it would organize for that purpose (R. I, 381–382). Standard agreed to form a new corporation (Colorado) and to finance its construction of pipeline facilities to connect with and transport gas from Canadian's facilities to the Denver market and intermediate points including Pueblo (R. I, 385). Cities Service was to procure franchises through its subsidiaries under which such natural gas could be distributed in Denver and Pueblo (R. I, 391). It was agreed that Canadian would sell gas to Colorado at "cost" for at least 20 years from 1928, such "cost" to include amortization of all of Canadian's indebtedness over the twenty-year period and to be decreased by any profits Canadian might obtain from other sources, including local sales permitted by Colorado (R. I, 392; R. II 719–732). Canadian, under the "cost" contract, would have nothing available for dividends on its common stock during the first 20 years (R. III, 1436) and so long thereafter as Colorado might choose to purchase its gas at "cost" (R. III, 1435).

Pursuant to the agreement, Southwestern organized Canadian, to which were transferred the gas leaseholds and producing properties of Amarillo, also a wholly-owned subsidiary of Southwestern. The cash consideration for this transfer was $5,000,000, stipulated in the tripartite agreement and advanced by Standard for this purpose at

6% interest (R. I, 392, R. V, 2936–2937).[1] To repay the advance and to finance the acquisition and construction of additional facilities, Canadian issued $11,000,000 of twenty-year 6% sinking fund bonds, which Colorado purchased from the proceeds of its $19,200,000 of twenty-year 6% sinking fund bonds, which, in turn, were purchased by Standard, in accordance with the 1927 agreement (R. I, 496).

As had been further agreed, Standard organized Colorado with $2,000,000 par value of 6% preferred stock and 1,250,000 shares of no par common stock, and paid $1,000,000 in cash for half of the preferred stock and another $1,000,000 in cash for its portion (42½%) of Colorado's common stock (R. II, 626). Southwestern also received half of Colorado's preferred stock and 42½% of the common stock (R. II, 626), the remaining 15% of the common stock being issued to Cities Service (R. I, 395–396, R. II, 627). It was implicit in the tripartite agreement, therefore, that Southwestern, Standard, and Cities Service would receive their profits from the operations of the enterprise by way of dividends on Colorado's stock.

The Commission's Orders.—In requiring Canadian to reduce its interstate wholesale rates

[1] As hereinafter discussed, *infra*, pp. 37–53, the Commission, in determining Canadian's rate base, disallowed the $3,249,030 portion of this amount which was in excess of the $1,750,970 cost of such properties to Amarillo and its affiliates.

by $561,000 annually, the Commission found the actual legitimate cost of the company's plant at December 31, 1939, to be $10,784,464 (R. I, 186). From this amount it deducted $2,134,629 for accrued depreciation and depletion as of that date, and added $150,738 for working capital and $574,923 covering gross plant additions to December 31, 1941. This resulted in a rate base of $9,372,496, which was rounded to $9,375,000 (R. I, 187). In requiring Colorado to reduce its interstate wholesale rates by $2,065,000 annually, the Commission found the actual legitimate cost of the company's plant at December 31, 1939, to be $11,879,409 (R. I, 190). From this amount it deducted $2,793,419 for accrued depreciation and amortization as of that date; and added $109,065 for working capital and $337,000 covering gross plant additions to December 31, 1941. This resulted in a rate base of $9,532,064, which was rounded to $9,535,000 (R. I, 190). Petitioners' estimates of reproduction cost were considered by the Commission and were found to be too conjectural to have probative value (R. I, 148). The Commission further found that actual costs, which could be readily determined from petitioners' accounting records, represented the best and only reliable evidence as to rate base (R. I, 148).

The Commission allowed a 6½% return on the rate base of each petitioner, which return it found to be "fair and reasonable" (R. I, 187, 190), noting that Colorado in 1940 had refinanced its

outstanding bonded indebtedness at an interest rate of 2¾% (R. I, 173). With certain minor exceptions, the Commission allowed each petitioner the taxes, operating expenses, exploration and development costs, shown by its books for the test year, 1939, adjusted to reflect accrual accounting (R. I, 166–169; R. VI, 3387). The Commission also allowed amounts to amortize rate case expenses over a five-year period (R. I, 166, 168). Annual allowances for depreciation, depletion and amortization were determined on the basis of the economic service lives of petitioners' properties, such allowances being consistent with the amounts deducted for accrued depreciation, depletion and amortization in arriving at the rate bases (R. I, 160, 156).

In arriving at the amount of the reductions in the interstate wholesale rates, the Commission made an allocation of the cost of service of each petitioner, including in such cost the fair return on the rate base, and determined the excess of revenues over costs for intrastate sales, direct industrial sales, and interstate sales for resale (R. I, 176–177).

The petitioners, on April 14, 1942, applied for a rehearing and stay of the Commission's orders (R. I, 203, 238, 277, 284), and on May 13, 1942, the Commission issued its supplemental opinion and orders denying such petitions (R. I, 296–301). On review the court below affirmed the Commission's orders (R. VIII, 5065–5094).

SUMMARY OF ARGUMENT

I

The action of the Commission in reflecting Canadian's production and gathering facilities in the rate base at cost and then limiting Canadian's return to 6½% was not a regulation of "production or gathering" forbidden by Section 1 (b) of the Act. That section withholds from the regulatory authority of the Commission the *activity* of producing or gathering natural gas, but there is nothing therein to indicate a Congressional intent to preclude the Commission from considering either such facilities in calculating the rate base or the expenses incident thereto for the purpose of determining the reasonableness of the interstate wholesale rates. *Federal Power Commission* v. *Hope Natural Gas Co.*, 320 U. S. 591, 614, n. 25. The legislative history of the Act confirms this view. The Committee report, after stating that the negative language in Section 1 (b) was largely surplusage, also stated that the Act contemplated regulation along "more or less standardized lines". The valuation of production and gathering facilities historically has been an integral part of the regulatory rate fixing procedure. *Dayton Power & Light Co.* v. *Commission*, 292 U. S. 290.

Sections 6 (a), 6 (b), 8 (a), 9 (a), and 10 (a) of the Act all contain language authorizing the Commission to ascertain the costs of production and

gathering facilities. The language and legislative history of Section 14 (b) confirm the view that the Commission is required to investigate such costs. The uniform administrative interpretation of the Commission consistently has been to consider production and gathering facilities in fixing the rate base and the Commission has so reported to Congress. Finally, legislative approval of the administrative interpretation may be inferred from the fact that when Section 7 was amended in 1942, no legislative change was made in respect of this matter although the Commission's administration of the Act was thoroughly reviewed.

II

The Commission's failure to allow a market value for Canadian's leaseholds in the rate base as well as its refusal to allow a "field" or "commodity" price for natural gas which Canadian produces was not a deprivation of due process. Canadian's contention to the contrary is inconsistent. If the Commission lacked jurisdiction over production and gathering facilities, the inclusion of leaseholds in the rate base at their market value would not confer jurisdiction. If it had jurisdiction, it is a matter for the informed judgment of the Commission to select the appropriate basis for reflecting the leaseholds in the rate base. Evidence of market value of the character submitted by Canadian is not compelling or even persuasive. *Dayton Power & Light Co.* v. *Commission*, 292 U. S. 290, 296–301.

Canadian's evidence of field or commodity price of gas as an alternative measure of the value of its leaseholds is open to the same objections. This is particularly true of the Panhandle field where the available gas greatly exceeds demands. The only substantial market is that furnished by the large pipelines which fix their own prices, and to speak of commodity value in such circumstances is unrealistic. This Court has recognized the peculiar situation which there obtains in *Thompson* v. *Consolidated Gas Co.*, 300 U. S. 55. The cost system adopted by the Commission on the other hand is just to consumers and pipelines alike. It considers costs as best calculated to insure continuity in the production of natural gas and the financial soundness of the pipelines themselves. The fact that it has become possible to finance such enterprises at progressively lower rates discloses that the investing public appreciates the ultimate soundness of the Commission's approach.

III

In respect of the leaseholds the Commission properly allowed the $1,750,000 cost of such properties to Amarillo and rejected Canadian's claim that $5,000,000 represented the "price" which it paid in acquiring these properties from Amarillo. There was no actual purchase or sale of the properties, which Southwestern merely transferred from one of its wholly-owned subsidiaries

(Amarillo) to another (Canadian). The alleged "purchase price" of $5,000,000 came from the proceeds of bonds issued by Canadian and did not represent any additional investment in the properties. In reflecting the so-called "payment" on their books, the parties recognized the true nature of the "purely intercompany profit" which the Commission has disallowed, and neither Southwestern, Amarillo, nor Canadian paid any income tax as a result of the so-called "sale".

Viewed from the standpoint of Standard and Cities Service, the $5,000,000 represented an advance of part of Southwestern's portion of the profits of the project. This amount is no more a part of the rate base than the dividends on Southwestern's stock holdings in Colorado Interstate. While Southwestern, Standard and Cities Service may have bargained extensively as to the distribution between them of the profits of the joint enterprise, such profits are not part of the rate base, even though one of the parties (Southwestern) received a portion ($5,000,000) of its share in advance because of its poor financial condition.

IV

In determining the amount of the reductions in petitioners' interstate wholesale rates, the Commission made an appropriate allocation of the cost of service between petitioners' regulable and non-

regulable sales. The Commission was not required, under the Constitution, the Act or the prior decisions of this Court, to take the preliminary step of first allocating the physical properties. Use of the established "commodity-demand" method of allocation represented a reasonable exercise of the Commission's administrative discretion in the circumstances.

V

All of the gas which Canadian sells to Colorado Interstate is sold "for resale" in interstate commerce and the rate charged therefor is subject to regulation by the Commission. As the provisions of Section 1 (b) of the Act and its legislative history make clear, the fact that Colorado Interstate sells a portion of such gas directly to industrial customers, rather than for resale, is not material in determining which of Canadian's rates are subject to the Commission's jurisdiction.

ARGUMENT

I

THE COMMISSION DID NOT EXCEED ITS JURISDICTION WITH RESPECT TO CANADIAN'S PRODUCING AND GATHERING FACILITIES

Canadian contends that the Commission, contrary to Section 1 (b) of the Act which makes the provisions thereof inapplicable to the "production or gathering of natural gas", exercised

rate regulatory authority over its production and gathering facilities by reflecting such properties in the rate base at cost and then limiting Canadian's return to 6½% (Can. Br. 14–19). It also urges that, in fixing rates, the Commission should determine the commodity or field price of gas (Can. Br. 21). While it is of course clear under Section 1 (b) of the Act that the Commission has no jurisdiction to regulate "production and gathering" as such, the Commission, in determining the reasonableness of a natural gas company's interstate wholesale rates, properly reflects its production and gathering facilities in the rate base, and properly considers the expenses, including depletion, applicable to such properties. We submit that there is no merit to Canadian's contention in this respect. *Federal Power Commission* v. *Hope Natural Gas Co.*, 320 U. S. 591, 614, n. 25. This is apparent from the purposes and provisions of the Natural Gas Act, as well as its legislative history.

Section 1 (a) of the Natural Gas Act declares that "Federal regulation *in matters relating to* the transportation of natural gas and the sale thereof in interstate and foreign commerce is necessary in the public interest" (emphasis supplied), and in accordance with this declaration of policy, Section 1 (b) provides that the Act "shall apply to the transportation of natural gas in interstate commerce, to the sale in interstate commerce of

natural gas for resale for ultimate public consumption for domestic, commercial, industrial, or any other use, and to natural gas companies engaged in such transportation or sale."

The above quoted provision in Section 1 (b), considered alone, clearly vests the Commission with jurisdiction over the production and gathering facilities of a natural gas company. Canadian contends, however, that the Act as a whole indicates that Congress intended to exclude from regulation the production and gathering phase of the business of a natural gas company. In support of this contention Canadian principally relies upon the "but" clause in Section 1 (b), which specifies that the provisions of the Act "shall not apply to any other transportation or sale of natural gas or to the local distribution of natural gas or to the facilities used for such distribution or *to the production or gathering of natural gas*" (emphasis supplied).

At the outset, it may be conceded that Section 1 (b) withholds from the regulatory power of the Commission the *activity* of producing or gathering natural gas, and that accordingly the Commission has no authority over such matters, as, for example, the determination of the drilling or spacing of wells in the field, the number of wells to be drilled in a common reservoir, proration of the production of oil or gas, or cycling or other recovery operations. However broad

may be the catalogue of activities thus excluded from the Commission's jurisdiction, we submit that there is no warrant for assuming that Congress, by excluding such activities, intended to preclude the Commission from reflecting the production and gathering facilities of a natural gas company in the rate base and considering the expenses incident thereto for the purpose of determining the reasonableness of interstate wholesale rates under the Act.

The legislative history confirms the fact that the "but" clause in Section 1 (b) does not remove from the Commission's jurisdiction what would otherwise be subject thereto by reason of its authority over the transportation and sale of natural gas in interstate commerce for resale under the first part of Section 1 (b). Thus, the House Committee on Interstate and Foreign Commerce in reporting the bill (H. R. 6586, 75th Cong., 1st Sess.) which became the Natural Gas Act, quoted the "but" clause in its report (H. Rep. No. 709, 75th Cong., 1st Sess., p. 3) and then stated:

> "*The quoted words are not actually necessary*, as the matters specified therein could not be said fairly to be covered by the language affirmatively stating the jurisdiction of the Commission, but similar language was in previous bills, and, rather than invite the contention, however unfounded, that the elimination of the nega-

> tive language would broaden the scope of the act, the committee has included it in this bill. That part of the negative declaration stating that the act shall not apply to 'the local distribution of natural gas' *is surplusage* by reason of the fact that distribution is made only to consumers in connection with sales, and since no jurisdiction is given to the Commission to regulate sales to consumers the Commission would have no authority over distribution, whether or not local in character." [Emphasis supplied.]

Section 5 (a) of the Act places the duty upon the Commission to determine "the just and reasonable rate, charge * * * to be thereafter observed and in force, and * * * fix the same by order." In both *Federal Power Commission* v. *Natural Gas Pipeline Co.*, 315 U. S. 575, and *Federal Power Commission* v. *Hope Natural Gas Co.*, 320 U. S. 591, the Commission, without challenge by either the natural gas companies or this Court, included the production and gathering facilities in the rate base on which a return was allowed. Indeed, in the *Hope* case, this Court observed (320 U. S. at 616) that the Natural Gas Act contemplated "regulation along recognized and more or less standardized lines", citing H. Rep. 709, *supra*, p. 3. The valuation of production and gathering facilities historically has been

an integral part of the regulatory procedure in fixing rates for natural gas. *Dayton Power & Light Co.* v. *Commission*, 292 U. S. 290; *Lone Star Gas Co.* v. *Texas*, 304 U. S. 224.

There are numerous provisions in the Natural Gas Act which clearly indicate that the Commission has jurisdiction over the production and gathering properties of a natural gas company to the extent necessary to carry out its functions under the Act, and particularly its principal function of determining the reasonableness of the company's interstate wholesale rates. Thus, Section 6 (a) authorizes the Commission to "investigate and ascertain the actual legitimate cost of the property of every natural-gas company, the depreciation therein, and, when found necessary for rate-making purposes, other facts which bear on the determination of such cost or depreciation and the fair value of such property." Section 6 (b) requires every natural gas company, upon request, to file with the Commission "an inventory of all or any part of its property and a statement of the original cost thereof." It will be noted that Section 6, which is directly related to the Commission's rate-making powers, extends to all the property of a natural gas company. Similarly, Section 8 (a), in authorizing the Commission to prescribe uniform and correct accounting for natural gas companies, extends to all the property of such

companies.[5] And under Section 9 (a), the Commission is authorized to determine and to fix by order the proper and adequate rates of depreciation and amortization "of the several classes of property of each natural-gas company used or useful in the production, transportation, or sale of natural gas." That the Commission's authority under this section is directly related to its rate-making powers is indicated by the proviso that nothing in that section shall limit the power of a state commission to determine the rates of depreciation or amortization to be allowed for the purpose of determining rates or charges subject to state regulation. Under Section 10 (a) the Commission is authorized to require natural gas companies to file reports giving full information as to assets and liabilities as well as the cost of maintenance and operation "of facilities for the production, transportation, or sale of natural gas."[6]

---

[5] Section 8 (a) of the Natural Gas Act is identical with and was taken from Section 301 (a) of the Federal Power Act. In reporting out the latter, the Senate Committee on Interstate Commerce stated (S. Rep. No. 621, 74th Cong., 1st Sess., p. 53) that "the authority of the Commission over the accounts of companies under its jurisdiction extends to the entire business of such companies."

[6] Section 5 (b) further provides that the Commission "may investigate and determine the cost of the production or transportation of natural gas by a natural-gas company in cases where the Commission has no authority to establish a rate governing the transportation or sale of such natural gas."

The conclusion that Congress contemplated that the Commission would consider the production and gathering properties of a natural gas company in determining interstate wholesale rates, is reinforced by the provisions and legislative history of Section 14 (b) of the Act. That section authorizes the Commission, after hearing, to determine the adequacy or inadequacy of the gas reserves of natural gas companies and, also after hearing, to "determine the propriety and reasonableness of the inclusion in operating expenses, capital, or surplus of all delay rentals or other forms of rental or compensation for unoperated lands and leases." The section further provides that the Commission, for purposes of such determinations, may require each natural gas company to file copies of "all its lease and royalty agreements with respect to such gas reserves."

The direct relation of Section 14 (b) to the Commission's rate making authority is clearly indicated by its legislative history. As introduced, the bill (H. R. 4008, 75th Cong., 1st Sess.) which, as amended (H. R. 6586, 75th Cong., 1st Sess.), became the Natural Gas Act, did not contain the provisions of Section 14 (b).[7] In the hearings before the House Committee the National Secretary of the Cities Alliance urged that

[7] The provisions of Section 14 (b) were contained in another bill (H. R. 5711, 75th Cong., 1st Sess.) which the Committee then had before it in addition to H. R. 4008.

the provisions of Section 14 (b) be added to the bill, "to prevent great pipe line corporations from acquiring more acreage than is necessary to supply the consuming public which it serves, and so far as the proposed amendment is concerned, would keep them from passing on the charge of carrying that property to the consuming public." He recognized that he could not ask the Committee "to go so far as to prevent them from making the purchase, if they want to, but we can ask that provision can be made whereby the Commission can see that the cost of carrying those excess acres, that are not necessary in the public interest, shall not be taken into consideration in passing upon the question of what are proper rates to be charged the consuming public." (Hearings on H. R. 4008, 75th Cong., 1st Sess., pp. 60, 67, 84).

The purpose of Section 14 (b) is further apparent from the testimony of Mr. William A. Dougherty before the Committee. Mr. Dougherty, who identified himself as a New York attorney connected with the management of certain natural gas pipe-line companies, including Colorado Interstate Gas Company, which he named (Hearings, p. 123), objected to the proposed amendment because of the additional expense which would be involved in filing copies of all leases and royalty agreements. He contended that such a requirement was "not necessary" since the

"only purpose of having information on lease and royalty agreements is when you are determining a rate and when you are going to determine a rate you can have those things brought in" (Hearings, p. 131). Mr. Dougherty further stated that careful consideration should be given to the provisions of the proposed amendment authorizing the Commission to determine the adequacy or inadequacy of gas reserves, and pointed out that "the Commission can exclude carrying charges of vast amounts of reserves as charges that have no immediate bearing on the immediate rate" (Hearings, p. 132). He added that "the law already gives the Commission the right to exclude delay rentals if the Commission feels that the reserve for which the delay rentals are included are too extensive, and I think the Commission would have that right even without this wording with respect to determining the adequacy or the inadequacy of gas reserves" (Hearings, pp. 132–133).

The hearings which the House Committee on Interstate and Foreign Commerce held on the first predecessor bill (H. R. 11662, 74th Cong., 2nd Sess.) which was reported out (H. Rep. 2651, 74th Cong., 2nd Sess.) also confirm the Commission's view. There the then Solicitor of the Federal Power Commission, Dozier A. DeVane, agreed with a member of the committee that the Commission "would go into all the great natural gas

fields of this country to determine costs" and "ascertain the cost of generating plant, and all the facilities, and, of course, build up a proper foundation for your rate finally to be sustained" as was done under Title II of the Federal Power Act (Hearings, pp. 31–32).

In addition, the Commission's administrative interpretation of the Act in this connection is of particular significance since it has been impliedly approved by Congress. The Commission in determining the reasonableness of interstate wholesale rates has consistently reflected the company's production and gathering facilities in the rate base.[*] This administrative interpretation of the Act was brought to the attention of Congress in the Commission's Twentieth Annual Report for the year 1940, which summarized the Commission's work in connection with major rate cases and in so doing, stated (p. 77):

> "*Gas reserves.*—As the natural-gas industry is an extractive industry, *one of the important elements of cost which must be determined pertains to the exhaustion of the service life of the properties due to the*

[*] *Illinois Commerce Comm.* v. *Natural Gas Pipeline Co.*, 25 P. U. R. (N. S.) 41, affirmed 315 U. S. 575; *Re Lone Star Gas Co.*, Order of May 4, 1942, in Docket No. G–209; *Cleveland* v. *Hope Natural Gas Co.*, 44 P. U. R. (N. S.) 1, affirmed 320 U. S. 591; *Re El Paso Natural Gas Co.*, Order of October 29, 1942, in Docket No. G–257; *Re Northern Natural Gas Co.*, 47 P. U. R. (N. S.) 74.

depletion of the natural-gas reserves which the properties were constructed to produce or transport. The Commission's geologists have been engaged in estimating the volume of gas reserves in a number of important fields, among them the Panhandle field in Texas, the Hugoton field in Kansas and a major portion of the fields located in West Virginia, Pennsylvania, and New York. A few years' difference in the estimated life of available gas reserves supplying a given market may *make a large difference in the rates* which can be justified for that area."[9] [Emphasis supplied.]

Soon after this report was submitted, the House Committee on Interstate and Foreign Commerce held hearings on a bill (H. R. 5249, 77th Cong., 1st Sess.) to amend Section 7 of the Natural Gas Act to broaden the Commission's jurisdiction with respect to certificates of public convenience and necessity. Following extensive hearings, during which the Commission's administration of the Act was fully explored (see Hearings, pp. 34–35, 40–46, 60–61), the bill was favorably reported and enacted on February 7, 1942.

---

[9] The report also pointed out that the Commission's staff, in connection with the organization of natural gas rate cases "along the lines indicated", had made four comprehensive field investigations, including the "Canadian River Gas Co., Colorado Interstate Gas Co., and Colorado-Wyoming Gas Co. in the Mid-West," the proceedings now under review in Nos. 370, 380 and 575, this Term.

We accordingly submit that the Commission had jurisdiction to reflect Canadian's producing and gathering facilities in its rate base, and to consider the expenses incident thereto in determining the reasonableness of its interstate wholesale rates.

II

THE COMMISSION PROPERLY DECLINED TO ALLOW CANADIAN THE ALLEGED MARKET VALUE OF ITS LEASEHOLDS OR A "COMMODITY" OR FIELD PRICE FOR ITS GAS

Assuming *arguendo* that the Commission did not exceed its jurisdiction in reflecting Canadian's production and gathering facilities in the rate base, Canadian nevertheless contends (Can. Br. 19–21) that it was deprived of its property without due process of law by reason of the Commission's refusal to be guided by evidence in the record as to the value of its leaseholds as of the time of the hearing. The alleged market value of the leaseholds was the subject of evidence presented by one of Canadian's witnesses, Wallace (Ex. 181; R. VI, 3181–3254). Although it is not entirely clear from Canadian's brief, it would seem (Can. Br. 20–21) that Canadian's position is that its rights would have been satisfied if the Commission had either accepted Wallace's conclusions as to the market value of the leaseholds, or, as an alternative, accepted as a measure of such market value the evidence of Canadian's witness

Ford (R. VI, 3255–3281) as to the market value of gas at the wellhead. We are unable to perceive the force of Canadian's contention in this respect. If the Commission has no jurisdiction over production and gathering facilities, the inclusion of such facilities at some particular value, however computed, could not avail to confer such jurisdiction. And if the Commission has jurisdiction, the selection of the appropriate method for determining the rate base and costs, as between several methods equally available in the particular case, is clearly a question for the expert judgment of the Commission, which is not to be overruled merely because it failed to select a method which would have produced a result more advantageous to the natural gas company involved. In this case both the alternative methods proposed by Canadian contain inherent defects and qualities of unreliability which fully justified the Commission in rejecting them, and in reflecting Canadian's production and gathering facilities in the rate base at their actual legitimate cost.

The evidence as to market value sought to establish a current value in excess of $15,000,000 for "the bare gas leaseholds themselves" (Can. Br. 20).[20] This evidence, however, was no more

[20] It is not the fact, as Canadian states (Can. Br. 20), that the Commission included "Canadian's bare leaseholds * * * at a value of something less than $1,000,000." $2,194,841 was included for lease costs. After deducting $252,006 for accrued depletion, the Commission allowed $1,942,835 as net invest-

than opinion evidence of a single witness who endeavored to reflect the assumed "value" from the demand for gas by Canadian's customers and the construction of pipeline facilities to serve them. Such "value" was also enhanced by the benefits of conservation legislation. Just such testimony was condemned, in the words of Mr. Justice Cardozo, in *Dayton Power & Light Co. v. Commission*, 292 U. S. 290, at 299:

> "* * * But plainly opinions thus offered, even if entitled to some weight, have no such conclusive force that there is error of law in refusing to follow them. This is true of opinion evidence generally, whether addressed to a jury [cases cited] or to a judge [cases cited] or to a statutory board [cases cited]. There are reasons why the principle has special application here. In the first place, the intrinsic value of the leases is dependent upon the capacity of the lands to yield productive wells, a capacity seldom to be judged with even a fair approach to certainty until tested by experience. *Natural Gas Co. of W. Va. v. Public Service Comm.*, 95 W. Va. 557, 569, 121 S. E. 716. In the second place, the profits

ment. In addition, $40,453 of the amount allowed in the rate base for interest during construction related to the lease investment. Moreover, the Commission allowed $29,294 in the expenses of the test year for the cost of a dry hole, which would be the equivalent of increasing the rate base $450,677 when the return is 6½%. See generally R. V, 2657-61, 2667-71, 2723, 2737, 2741, 2769; R. VI, 3404; Appendix D, *infra*.

> to be earned in a regulated business must vary with the rates established by the supervising agencies of government, with the result that prophecies, however radiant, may be upset over night by the publication of a lower schedule."

Obviously, such testimony was not of such compelling merit as to require the Commission to disregard the actual legitimate cost of the properties involved.

As indicated by Canadian in its brief (Can. Br. 20–21), the so-called "field" or commodity price of gas is advanced as an alternative "measure of the value" of its leaseholds. Such evidence is clearly subject to the same infirmity as was attributed in the *Dayton* case to evidence of market value. But the vice of the "field price" test lies even deeper. In the Panhandle field the actual and potential production of gas is greatly in excess of needs (R. I, 159). The only markets which are available are located at distant points, and in order to transport gas to these markets it is necessary to construct expensive pipelines.[11] Before embarking on such an undertaking, it is essential that the company constructing the line be assured of an adequate supply of gas. This is accomplished either by acquiring sufficient producing and

[11] E. g., Panhandle Eastern's pipeline represented an investment in excess of $70,000,000. No. 296, this Term. Natural Gas Pipeline Co. had a book cost in excess of $60,000,000 (315 U. S. at 579).

proved gas acreage to insure future supplies, or by entering into long-term contracts with producers of gas under which the parties are bound to the sale and purchase of the gas as long as it shall be produced in paying quantities. Federal Trade Commission Report pursuant to Senate Resolution No. 83, 70th Cong., 1st Sess., Vol. 84 a, pp. 70 *et seq.* In a sense the cost which the pipeline company will be required to pay for the natural gas is determined at the inception of the enterprise. In a setting such as this the concept of a "field" or commodity price is unrealistic.

This Court had occasion to review the situation which obtains in the Panhandle field in *Thompson* v. *Consolidated Gas Co.*, 300 U. S. 55. Without access to pipelines and their distant markets, natural gas produced in the fields had no commercial value other than the extraction of natural gasoline or the production of carbon black (id., pp. 59, 70). In the *Thompson* case, this Court held unconstitutional a Texas statute which sought to compel large pipeline companies to purchase a part of their gas requirements from private producers. There the question of commodity price was not even reached—the pipeline companies did not want the gas at any price.

The value which gas obtains in a market such as the Panhandle or Hugoton field depends exclusively upon the price which the few large pipeline companies are willing to pay. Cf. *United*

Fuel Gas Co. v. *Railroad Commission*, 278 U. S. 300; *Dayton Power & Light Co.* v. *Commission*, 292 U. S. 290, 301. Whatever might be the situation where the demand equals or exceeds the supply of natural gas, it is apparent that where the market can absorb only a small fraction of the gas produced the purchaser is in a superior bargaining position. In such circumstances the commodity price, if the law of supply and demand is permitted to operate, will necessarily tend to reflect cost alone. And should competition be sufficiently keen, that cost would probably not carry a 6½% profit.[12] Were Canadian deprived of its markets outside the state, its gas would have little if any value. It would find itself in the same position that its predecessor Amarillo was in—the owner of a vast supply of gas which it could not sell.

Prevailing prices accordingly do not establish a commodity value. When the sales contracts extend for the life of the wells, and vary among themselves, the rates fixed therein merely reflect what the parties to the contract at one time considered to be a fair price. It could currently be either more or less. There is no such thing as a true commodity price unless there are frequent adjustments in price to reflect the changing supply and demand. Moreover, the adoption of a com-

[12] The Commission, in fixing costs in the instant case, included therein a return of 6½ on the rate base.

modity price would open the door for the establishment of fictitious prices. Over 80% of the total area of the Panhandle fields is controlled by major pipeline companies (300 U. S. at 60). It would be possible for these companies to buy small amounts of gas from independent producers at a high Mcf price and accordingly claim that the price so paid represented the commodity value to which they were entitled in calculating the value of the gas which they produced themselves. "When the pipe-line interests control the only outlets to markets, an arbitrary setting of field prices seems inevitable" (Federal Trade Commission Report No. 84–a, p. 133).

On the other hand, the cost system adopted by the Commission is fair alike to consumers and natural-gas companies. It is readily apparent that if a field such as Panhandle or Hugoton should be discovered near Chicago or Detroit, cost of delivering gas from such field to those cities would be low and gas companies which were incurring higher transportation costs in delivering gas from distant points would be faced with bankruptcy if they were held to the commodity prices.[13] On the other hand the Commission allows the acquisition costs of leaseholds, the delay rentals thereon while they are being held in reserve, well drilling and exploratory costs and all expenses incident to the

[13] It is significant to note that Hope Natural Gas Company purchased gas at prices lower than the cost of producing its own gas. See record in No. 34, Oct. Term 1943, II, 309, 342.

operation of the gas leaseholds, including royalty payments. Thus, the pipeline companies, whose business in the final analysis consists of the interstate sale of gas at wholesale, are assured of the cost of producing the commodity which they sell. Certainly, it may not be said that the action of the Commission in electing to use the cost rather than the commodity value of the gas lacks a rational basis. See *Federal Power Commission* v. *Hope Natural Gas Co.*, 320 U. S. 591, 615–616. Indeed, since the Commission has established its policy of allowing cost of production, investors have been lending money at progressively lower rates (see Exhibit 253, Charts Nos. 33 and 34, in No. 296, this Term, R. XIV, 6031, 6033). The average yield on bonds, debentures and notes issued by natural-gas companies has declined from 4.59% in 1936 to 3.11% in 1941 (ibid.).

Finally, if the commodity price rather than cost were adopted by the Commission there would no longer be any necessity for treating the gas business as presenting any peculiar hazards. As a result, the transmission facilities, which constitute the larger portion of the pipe lines investment, would be entitled to a lower rate of return than 6½%.

We accordingly submit that there was no requirement that the Commission, in fixing Canadian's rates for the interstate sale for resale of natural gas, should fix the cost of the gas so sold on a commodity rather than a cost of production basis.

III

IN DETERMINING THE ACTUAL LEGITIMATE COST OF CANADIAN'S PROPERTIES, THE COMMISSION PROPERLY DISALLOWED AMOUNTS CLAIMED BY CANADIAN FOR LEASEHOLDS IN EXCESS OF THE COST OF SUCH LEASEHOLDS TO AMARILLO AND ITS AFFILIATES

Assuming that the Commission was entitled to include Canadian's producing and gathering properties at their actual legitimate cost, Canadian nevertheless contends (Can. Br. 21–26) that it was deprived of its constitutional rights by the Commission's failure to include in such cost the full amount of $5,000,000 allegedly paid for such properties as an arm's length "purchase price" therefor. We submit that there was no actual purchase or sale of these properties, but that Southwestern merely transferred them, without any additional investment, from one wholly owned subsidiary (Amarillo) to another (Canadian), in accordance with the intercompany agreement between Southwestern, Standard and Cities Service (see Statement, *supra*, pp. 8–10). Moreover, if, as Canadian urges (Br. 56), the transaction is considered to be the substantial equivalent of a "sale" of the properties by Southwestern to Standard and Cities Service, the other participants in the project, the $5,000,000 represented an advance of a portion of Southwestern's share of the profits of the joint enterprise.

A. THE PROPERTIES WERE TRANSFERRED BETWEEN WHOLLY OWNED SUBSIDIARIES OF SOUTHWESTERN WITHOUT ANY ADDITIONAL INVESTMENT

Southwestern, through Amarillo, its wholly owned subsidiary, controlled certain gas leases and producing properties in the Texas Panhandle Field, but was unable to obtain an adequate market for the gas (R. I, 402, 459). Southwestern, which was in a poor financial condition, approached Standard and Cities Service with respect to the feasibility of constructing a pipeline from the Panhandle Field to the Denver and Pueblo markets in Colorado (R. I, 520, 559; R. I, 403). Standard was in a position, through the Rockefeller interests, to obtain the Colorado Fuel & Iron Company plant at Pueblo as a large industrial consumer for the pipeline (R. I, 509). Standard also had adequate funds at its disposal, as well as a trained personnel familiar with the construction and operation of natural gas pipelines (R. I, 403). Cities Service, a third party, controlled the retail markets in Denver and Pueblo (R. I, 403) which likewise had to be obtained if the project was to be sufficiently profitable (R. I, 437, 508).

By the intercompany agreement of April 5, 1927, Southwestern, Standard and Cities Service pooled their interests and made arrangements to bring natural gas from the Panhandle Field to the Denver and Pueblo markets. The substance

of the agreement was that (a) Southwestern would furnish gas to the pipeline from its producing properties at "cost"; (b) Standard would invest $2,000,000 of cash as equity capital and purchase the bonds to be issued to finance the balance of the project, as well as obtain Colorado Fuel & Iron Company as an industrial customer; and (c) Cities Service would have its operating subsidiaries in Denver and Pueblo obtain the requisite natural gas franchises and purchase their entire requirements from the pipeline (R. I, 381–401).[14]

The corporate arrangements under which this pooling of interests was effected may be briefly summarized. Pursuant to the intercompany agreement, Southwestern organized a new wholly owned subsidiary, Canadian,[15] to which were transferred the gas leaseholds and producing properties held by Southwestern's wholly owned subsidiary, Amarillo (R. I, 405). Standard organized a second corporation, Colorado Interstate, to construct and operate the pipeline facilities which would connect with and transport gas from Canadian's facilities to the Denver market and intermediate points, including Pueblo (R. I, 385).

---

[14] The agreement was not to become effective unless franchises were obtained in Denver and Pueblo which prescribed rates which would make the project "profitably feasible in the judgment" of the three participants, and a schedule of rates which would be satisfactory was specified in the agreement (R. I, 393–394).

[15] All of Canadian's stock was issued to Southwestern, and is carried on Canadian's books at $1.00 (R. VI, 3523).

Canadian, in order to finance its portion of the project, issued $11,000,000 of 6% twenty-year sinking fund bonds. These bonds were purchased by Colorado Interstate from the proceeds of $19,200,000 of its own 6% twenty-year sinking fund bonds which Standard in turn purchased at par (R. I, 496).

As had been agreed, Southwestern caused Canadian to enter into a so-called "cost contract" with Colorado Interstate under which Canadian obligated itself to produce and sell gas for the project at "cost" for a period of twenty years and such further time as Colorado Interstate deemed it profitable to purchase such gas (R. II, 710–797). Under the contract such "cost" included Canadian's operating expenses, as well as interest at 6% and amortization of the principal of all of Canadian's indebtedness over the twenty-year period, such amortization being in lieu of depreciation, depletion and retirements.[16] The contract

[16] An amortization period of twenty years appears to have been specified for the reason that that was the term of the distribution franchises in Denver and Pueblo (R. I, 338). At the end of the test year, 1939, Canadian's "cost" of gas under the contract had included amortization of debt totalling $9,073,565 (R. VI, 3581). The Commission deducted $2,134,629 for depreciation and depletion in finding Canadian's rate base (R. I, 161). The interest rate of 6% on Canadian's bonds has not been reduced although the interest on Colorado's bonds was reduced to 2¾% in 1940 (R. II, 632).

further provided that Canadian's "costs" should be decreased by any profits which it might obtain from other sources, including local sales permitted by Colorado (R. I, 393; R. II, 719–732).

Since Canadian, under the "cost" contract, would not have any profits available for dividends (R. III, 1436), it was implicit in the intercompany agreement that the three participants, Southwestern, Standard, and Cities Service, would receive their profits from the joint enterprise in the form of dividends on their stock holdings in Colorado Interstate. Pursuant to the agreement, Colorado Interstate issued $2,000,000 par value of 6% preferred stock and 1,250,000 shares of no par common stock (R. I, 395–396). 15% of the common stock was allotted to Cities Service as its share of the profits of the joint enterprise (R. I, 396). The remaining 85% of the common stock and all of the preferred stock was divided equally between Southwestern and Standard. For its share (50%) of the preferred stock and its share (42½%) of the common stock, Standard paid $2,000,000 in cash (R. II, 626).[17] In addition to 50% of Colorado Interstate's preferred stock and 42½% of its common stock, Southwestern received $5,000,000 in cash from the proceeds of the $11,000,000 of bonds issued by Canadian, which bonds were to be amortized over twenty years as

[17] This was the only equity capital actually invested in the entire enterprise.

part of the "cost" of gas to Colorado Interstate. This $5,000,000 is the alleged "purchase price" of the gas leases and producing properties of Southwestern's subsidiary (Amarillo) which Canadian contends the Commission should have allowed in determining its rate base.

Upon the foregoing facts, we submit that the Commission was entirely justified in concluding that, from the standpoint of Southwestern and its wholly owned subsidiaries, no true purchase and sale occurred, and the $5,000,000 represented no additional investment in the properties. We discuss below our view that the $5,000,000 in actuality represented an advance of a portion of Southwestern's profits in the joint enterprise; but however that may be from the standpoint of the relationship between Southwestern and its partners, it seems obvious that as between Southwestern and its subsidiaries there was no more than a paper intercompany profit.[18] Had Canadian never been

[18] The $5,000,000, although reflected on Amarillo's books largely in the form of credits, was not in fact even paid to Amarillo by Canadian. Prior to Canadian's organization, Standard advanced $5,000,000 in cash to Prairie Oil & Gas Company, a holding company affiliated with Southwestern, and Prairie used the sum in discharging certain obligations of Southwestern and Amarillo, in advancing $1,000,000 to West Texas Gas Company, another Southwestern subsidiary, and in furnishing $310,000 to Amarillo (R. V, 2937, 2932–35). Canadian, upon its organization, repaid the $5,000,000 to Standard with 6% interest, out of the proceeds of its bonds sold to Colorado Interstate.

organized, and instead Amarillo had placed the bond issue on the properties and either turned over $5,000,000 of the proceeds to its parent or repaid Standard the same sum in satisfaction of a loan, there would be no possible basis for contending that the payment represented an investment by Amarillo which should be allowed as part of the rate base. Cf. *Northwestern Electric Company* v. *Federal Power Commission*, 321 U. S. 119. The circumstance that for convenience in segregating the properties which were to be devoted to the project it was decided to place them in a new company—Canadian—likewise a wholly owned subsidiary of Southwestern, can have no effect upon the reality of the transaction.[19] In either event, Southwestern would merely have received $5,000,000 as part of the proceeds of a bond issue secured by a mortgage on properties owned by one of its wholly-owned subsidiaries. No part of this $5,000,000 was, or could be, turned into an investment in the properties by the device of shifting them over to a new wholly owned company before having the mortgage and bond issue executed.

---

[19] Testimony of one of Canadian's witnesses (R. I, 521) shows that the decision not to place the properties in the new pipeline company (Colorado Interstate) was due to Standard's reluctance to be known as having an interest in a company owning land in Texas. The decision having thus been made to leave the ownership of the properties in Southwestern, it is obvious that mere considerations of corporate convenience must have determined in which of Southwestern's pockets they should be kept.

The unreality of the so-called "payment" is emphasized by the treatment accorded to the transaction on the books of the companies involved. The difference between the $5,000,000 "payment" and the cost of the properties—a difference of more than $3,000,000—was recorded by Amarillo on its books[20] as "paid in surplus" (R. V, 3046) and by Canadian, until 1939, as "appreciation" (R. V, 2630–2632), thus establishing that at the time the excess was regarded by the participants as too lacking in substance to be treated as a valid cost to Canadian or as a *bona fide* profit to Amarillo. In fact, in 1935 one of the principal executives of the Southwestern holding company group described the excess as "purely an inter-company profit" (R. I, 559). The "profit" disappeared in the consolidated tax return of Southwestern and its subsidiaries, including Amarillo and Canadian, and none of the companies paid any income tax as a result of the so-called "sale" (R. V, 2638).[21]

[20] This in spite of the fact that the "payment" was not actually made to Amarillo. See footnote 18, *supra*.

[21] While Canadian intimates (Can. Br. 60) that the effect of the elimination of taxable profit upon its depreciation and depletion base may in the long run result in its being required to pay "more, rather than less, Federal income taxes," it is to be noted that the Commission, in determining Canadian's income available for a fair and reasonable return, allowed all of Canadian's 1939 tax expense, finding it to be ample (R. I, 297).

Contrary to Canadian's contention (Br. 67), there is nothing in *A. T. & T. Co.* v. *United States*, 299 U. S. 232, inconsistent with the treatment here accorded to the intercompany profit. Because of the stipulation filed by the Federal Communications Commission in that case, the Court had no need to, and did not, decide the question whether the price paid in an acquisition of property may be disregarded merely because the parties to the transaction were affiliated. Here, the issue is whether any portion of the $5,000,000 advance did in fact, and "after a fair consideration of all the circumstances, * * * represent an investment" (299 U. S. at 241). The *A. T. & T.* case, however it may control the treament of the investment once its existence is determined, is of no aid in determining whether in fact it did exist.[22]

Here, the Commission has found that the "payment" did not in reality represent any increase in investment in the properties. The true character of the transaction is discussed in detail under the following heading.

[22] The decision of the three-judge statutory court in *New York Telephone Co.* v. *United States*, 56 F. Supp. 932, is likewise of no aid to Canadian's argument. Apart from the question whether that case was correctly decided, it involved an entirely different factual and statutory situation, including the significance of the company's contention that its accounting had been in accord with, if not required by, the regulations of the Interstate Commerce Commission applicable to it at the time.

B. FROM THE STANDPOINT OF STANDARD AND CITIES SERVICE THE $5,000,000 WAS AN ADVANCE TO SOUTHWESTERN OF A PORTION OF ITS SHARE IN THE PROFITS OF THE JOINT ENTERPRISE

In its statement of the questions presented, upon which the writ of certiorari was granted in No. 380, Canadian has chosen to treat the $5,000,000 "payment" as "the amount actually invested by Canadian in its original acquisition of production properties" (Question 3; see Can. Br. 3). So regarded, the excess disallowed by the Commission was, as we have seen, merely a paper profit in a transaction between wholly owned subsidiaries of the same parent. Doubtless recognizing the weakness of its position as thus originally presented to the Court, Canadian insists that the proper treatment of the "payment" is not as an investment by Canadian at all, but as the proceeds of an arm's length purchase of the properties by Cities Service and Standard from Southwestern. It states (Can. Br. 64) "that the real transaction was between non-affiliated parties [Southwestern on the one side and Standard and Cities Service on the other; see Can. Br. 56] and that the purchase price was agreed upon only after prolonged arm's length bargaining between non-affiliated parties." It emphasizes that there were no negotiations between Canadian and Amarillo, and that the $5,000,000 was paid before Canadian was even organized (Can. Br. 11, 59).

It may be conceded for purposes of our argument that Southwestern bargained at arm's length with Standard and Cities Service. But this does not make of the transaction a sale of producing properties by Southwestern. Southwestern owned the properties before the intercompany agreement, and it continued to own them afterwards, subject only to Canadian's obligation to furnish gas to the project at "cost." Subject to that obligation it still owns them. Title to the properties was merely transferred from one of its wholly owned subsidiaries to another.

True, under the intercompany agreement Southwestern's properties held by Canadian were subject to a "servitude" in favor of the joint project in which Southwestern was a participant. But this did not convert the transaction into a "sale" of the properties. Rather, Southwestern, as its contribution to the project, agreed to commit its properties to the furnishing of gas to the project at "cost". This was Southwestern's contribution to the enterprise, and its only contribution. In consideration for this contribution Southwestern received its share of Colorado Interstate's stock—50% of the preferred and 42½% of the common—and a cash advance of $5,000,000 (R. I, 392). Standard, on the other hand, as its contribution, put up $2,000,000 in cash as equity capital, and

purchased the bonds which were issued to finance the balance of the project (R. I, 496).[23]

Accordingly, if the transaction is to be viewed, as Canadian urges (Can. Br. 56, 64), from the standpoint of the three participants in the joint enterprise, the $5,000,000 clearly represents, not the purchase price paid by the project for Southwestern's properties, but rather a portion of Southwestern's share of the profits of the project—a share of the profits to exactly the same extent as its anticipated dividends on its allotment of Colorado Interstate's preferred and common stock. It is not, and could not reasonably be, suggested that the dividends obtained by the participants on their Colorado Interstate stock should be included in the rate base for the purpose of determining the reasonableness of the rates to be borne by the consuming public; and we submit that no greater basis exists for including a cash advance of such profits by one of the participants to another. That Southwestern and Standard may have been at arm's length in bargaining as to

---

[23] The advance to Southwestern first took the form of a short-term loan at 6%. This was repaid by Canadian upon its organization out of the proceeds of its 20-year 6% bonds which it sold to Colorado Interstate. Standard, in turn, by buying Colorado Interstate's 20-year 6% bonds, furnished Colorado Interstate with the funds with which to buy Canadian's bonds (R. I, 496). In the last analysis, therefore, Standard advanced the $5,000,000 to Southwestern on a 20-year sinking-fund basis, at 6% interest.

how much Standard would advance can have no effect upon the nature of the transaction between them.

Regarded from the standpoint of the three participants, as Canadian urges, the case is in essential respects similar to that presented in *Niagara Falls Power Company* v. *Federal Power Commission*, 137 F. (2d) 787 (C. C. A. 2), certiorari denied, 320 U. S. 792. There, two unaffiliated groups, the Schoellkopfs and the Stetsons, owned and operated hydro-electric projects at Niagara Falls, New York. In order to utilize all the water being diverted by the two projects through the higher head and more efficient Schoellkopf plant and thus produce more power during World War I, the New York State Legislature, at the urgent request of the Federal Government, passed a special act authorizing the Schoellkopf companies to consolidate with the Stetson company to form a single "new" corporation.[24] The special act further provided that the new corporation could issue stock in exchange for the stock of the underlying companies in amounts not exceeding the aggregate of the book value of the latter. The consolidated corporation subsequently obtained a

[24] Diversions from the Niagara River for power purposes on the United States side were limited to 20,000 c. f. s. under the International Boundary Water Treaty of 1910 (36 Stat. 2448, 2450) and this amount of water was being diverted by the Schoellkopf and Stetson projects under special permits issued by the Secretary of War.

license from the Federal Power Commission under the Federal Water Power Act of 1920, and in determining the actual legitimate cost of the combined properties the Commission found substantial "write-ups" on the books of the predecessor companies which had been transferred to the books of the new company in the consolidation. The Commission "went behind" the consolidation and disallowed such "write-ups". Upon review of the Commission's order, the company, relying upon the absence of any affiliation between the original Schoellkopf and Stetson companies, contended that its stock issued in exchange for the stock of the predecessor companies had been issued in an arm's length transaction, and that since the amounts transferred to the consolidated company's books were fully supported by the then "value" of the underlying properties, such amounts should have been allowed as part of the cost of the properties.

In rejecting this contention and sustaining the Commission's order, the court, in an opinion by Judge Learned Hand, held (137 F. (2d) at 793-794):

> "* * * The three companies did not sell their properties to the petitioner, and the petitioner did not buy of them. We do not mean merely that the form of the transaction was not a sale—we should not stand on that—the substance also was not a sale. The properties had been held by two groups of persons: 'Stetson' and 'Schoellkopf' who

> combined their interests into one company which thereafter they owned jointly. The allotment of the shares as between the two groups was doubtless the result of genuine competition; presumably it followed the relative values of the properties. But all competition, all 'arms-length' bargaining, stopped there; neither party had any interest to reduce the nominal capitalization. * * * In short, while it may be tolerable to allow a buyer to capitalize the purchase price he may have paid, even though that has been computed upon the assumed continuity of rates which were higher than they should have been, there is surely nothing to be said in favor of allowing two companies mutually to pool their interests, and from that time forward to treat as vested the values they happened then to have."

Canadian contends (Br. 68) that the *Niagara Falls* case is not in point because there no money changed hands and in the end "each of the so-called sellers owned a portion of the combined assets". It is true that here Colorado Interstate, which was jointly owned by the three participants in the enterprise, did not acquire title to the properties as in the *Niagara* case, such title being vested in Canadian, the wholly owned subsidiary of one of the participants, Southwestern. However, this merely points up the fact that, as we

have seen, the actual transfer of the properties in this case was from one subsidiary of Southwestern (Amarillo) to another (Canadian), without any additional investment. The weakness of Canadian's position is emphasized by the fact that to avoid treatment of the excess as a properly disallowable intercompany profit, it must argue that the properties were "sold" not to Canadian but to the project, and that it must deny the very same conclusion to escape the authority of the *Niagara* case. If the transaction was in reality a sale to the project, the technical retention of title in Canadian should not be permitted to divert attention from the substance of the situation.

Nor does the "payment" of $5,000,000 to one of the participants serve to distinguish the cases. As we have seen, in spite of its form, this "payment" was in reality no more than a loan, received through the issuance of Canadian's bonds, which would be amortized over a twenty-year period as a "cost" in Canadian's sale of gas to Colorado Interstate. To the extent of this amortization, Colorado Interstate's "cost" of gas under the contract would be increased, and its profits available for dividends on its stock correspondingly decreased. From the standpoint of the other two participants, the loan was no more than an advance payment of Southwestern's share of the

anticipated profits. The amount of the advance has no greater bearing on the extent of Canadian's or Southwestern's investment in the properties than if Southwestern had bargained, equally at arm's length, with its banker for a loan on the strength of its prospects of profit from the venture.

Finally, we respectfully submit that in such an area as this, where proper treatment of an item of alleged "cost" depends upon the factual significance to be given to a large mass of related details in a complex intercorporate arrangement, the judgment of the Commission as the agency charged by Congress with the responsibility for making the essential factual determinations underlying the fixing of just and reasonable rates should be given peculiar weight by the courts. As this Court has many times held in comparable fields, on such a question the administrative judgment should be left undisturbed if only it has warrant in the record and a rational basis in law. Cf. *National Labor Relations Board* v. *Hearst Publications*, 322 U. S. 111, 131; *Dobson* v. *Commissioner*, 320 U. S. 489. We submit that in this instance there is at the very least no such infirmity in the Commission's determination of the true nature of the transaction as would justify substitution of the judgment of the courts for that of the Commission.

IV

THE COMMISSION PROPERLY DETERMINED THE AMOUNT OF THE REDUCTIONS IN PETITIONERS' REGULATED RATES BY AN ALLOCATION OF COSTS BETWEEN REGULABLE AND NONREGULABLE SALES

In objecting to the Commission's allocation of cost of service between the regulable and nonregulable sales, Canadian and Colorado Interstate contend that the Commission was required, as a matter of "jurisdiction", to make an allocation of their physical properties (Can. Br. 26–30; and Col. Br. 27–41). Petitioners further contend that the Commission should have adopted the allocation proposed by their witnesses instead of that presented by the Commission's engineer (Can. Br. 76–83; Col. Br. 41–56). We submit that there is no merit in these contentions. The Act vests the Commission with administrative discretion in the matter of allocation, and since the allocation of cost of service which the Commission here adopted was "a working one suitably adapted to the particular circumstances," it was properly affirmed by the court below (R. VIII, 5087).

A. THE COMMISSION HAS ADMINISTRATIVE DISCRETION TO ADOPT ANY METHOD OF ALLOCATION WHICH IS REASONABLE AND APPROPRIATE

There is no basis for petitioners' contention that the Commission was required to make an allocation of their physical properties, and, there-

fore, erred in determining the reasonableness of their interstate wholesale rates upon the basis of an allocation of the cost of service. The Natural Gas Act does not prescribe any method of allocation which the Commission must follow in determining the reasonableness of the interstate wholesale rates of a natural gas company.[25] Congress thus left the matter of allocation to the expert judgment of the Commission, subject to judicial review in the event of an abuse of its administrative discretion in this regard.

The sole purpose of an allocation between the regulable and nonregulable sales of a natural-gas company is to aid the Commission in its determination of the reasonableness of the return which the company is receiving from its regulated rates and to enable the court on review to determine whether a prescribed reduction in such rates violates any constitutional standards. In reviewing such orders this Court has not undertaken to prescribe any particular formula or method of allocation. As Mr. Justice Brandeis observed in *Groesbeck* v. *Duluth, S. S. & A. Ry. Co.*, 250 U. S. 607, 614, "it is much easier to reject formulas presented as being misleading than to find one apparently adequate." He also noted that the determination of the formula to be adopted in a

[25] Nor does the Act by its terms require that a formal allocation be made. This question is discussed in greater detail in our brief in No. 296, this Term.

particular case "presents a question, not of law, but of fact," and as Mr. Justice Douglas said in the recent case of *Butler Brothers* v. *McColgan*, 315 U. S. 501, 507, "one who attacks a formula of apportionment carries a distinct burden of showing by 'clear and cogent evidence' that it results in extra-territorial values being taxed."

The decisions of this court in the *Minnesota Rate Cases*, 230 U. S. 352, and in *Smith* v. *Illinois Bell Telephone Company*, 282 U. S. 133, do not support petitioners' contention that the Commission, as a matter of jurisdiction, had to make an allocation of their physical properties. In those cases, State agencies were undertaking to regulate the intrastate rates of utilities which were also engaged in interstate operations, the latter being constitutionally immune from State regulation. The regulation of the interstate wholesale rates of natural gas companies under the Natural Gas Act does not present such a constitutional problem, since Congress, if it so desired, could regulate the intrastate rates of such companies which "affect" their interstate rates and operations. In any event, an allocation of properties is merely a step in the determination of the costs (including return) properly allocable to the several classes of service of a company. As the Commission here observed, "all that can be accomplished by an allocation of physical properties can be attained by allocating costs including return" (R. I, 175).

It is thus apparent that the Commission is not precluded by the Constitution, the Act, or the prior decisions of this Court, from making a proper allocation of costs, including return, without first taking the preliminary step of allocating the physical property.

B. THE COMMISSION'S ALLOCATION OF COST OF SERVICE WAS REASONABLE AND APPROPRIATE

In arriving at the amount of the ordered reductions in petitioners' interstate wholesale rates, the Commission made an allocation of the cost of service of each petitioner, including in such cost the fair return on the rate base, and determined the excess of revenues over costs for intrastate sales, interstate direct industrial sales, and interstate sales for resale (R. I, 176–177). In making such allocation of costs, the Commission adopted the so-called "demand and commodity" method,[26] which had been presented by its staff witness Lyon, a gas engineer of wide experience (R. IV, 2375–80). We submit that the Commission's action in this regard was an appropriate and reasonable exercise of its administrative discretion in the circumstances.

The amount of gross revenues which petitioners derived from each of their customers was definitely known and undisputed. Accordingly, the

[26] See *Arkansas-Louisiana Gas Company* v. *City of Texarkana*, 17 F. Supp. 447, affirmed, 96 F. (2d) 179 (C. C. A. 8), certiorari denied, 305 U. S. 606.

only problem involved in a determination of the reasonableness of petitioners' interstate wholesale rates was to arrive at the portion of petitioners' operating expenses, including depreciation, depletion, taxes, exploration and development costs, which was properly allocable to each customer. Inclusion of the fair return of 6½% in the costs being allocated, gave the amount of revenue, in excess of costs and a fair return, being derived from each of petitioners' customers. Having thus determined the amount of excess revenues being derived from the interstate wholesale customers, petitioners were ordered to reduce their rates to such customers accordingly.

The method of allocation of costs, including return, which was thus presented by the staff engineer and adopted by the Commission may be briefly summarized.

The total cost of service includes all costs allowed by the Commission, i. e., all operating expenses, exploration and development costs, taxes, depreciation, and a return of 6½% on the rate base.[2] Such total cost was separated into

---

[2] The total cost of service found by the Commission was $3,776,203, or $369,345 more than that used by witness Lyon, due principally to the Commission's allowance of a 6½% instead of a 6% return, and the Commission's increased allowances for depreciation, depletion and rate case expenses. These adjustments are tabulated in Schedules 1 and 2 of Appendix B, *infra*.

three classes, viz., "volumetric", "capacity" and "distribution" costs (R. I, 175; R. IV, 2317).[28] The volumetric costs were allocated to the customers on an annual Mcf basis, i. e., in the ratio that the sales to each customer in the test year 1939 bore to the total sales to all customers in that year. The total capacity costs were allocated to the customers in the ratio that the Mcf sales to each customer on the system peak day of February 9, 1939, bore to the total sales to all customers on that day (R. I, 175–176; R. IV, 2317–2319, 2381–2384).[29] The distribution costs, totaling $98,137, consist of two general classes: (1) depreciation, taxes, and return on investment in metering and regulating equipment

[28] The Commission characterized the "volumetric" or "commodity" costs as "variable costs * * * that vary proportionally to the output or volume of sale." It characterized the "capacity" or "demand" costs as "fixed costs * * * which do not vary with volume of sales" (R. I, 175–176).

[29] In allocating the capacity costs, domestic and commercial gas was treated as a class, and industrial gas, both direct and resale, as a separate class. It was then necessary for the expert to allocate the costs between direct and resale industrial sales. The capacity costs allocable to the industrials as a class were distributed to the individual industrial customers on a non-coincidental peak basis, i. e., in the ratio that each industrial customer's maximum 24-hour deliveries on any day in 1939 bore to the total of the maximum 24-hour deliveries of all industrials. This method produced substantially the same result as would have been obtained by using the ratio of sales on the single peak day of February 9, 1939, for allocating the costs as between direct industrials as a class and resale customers as a class (R. IV, 2438).

through which gas is delivered at individual stations to each customer, and (2) operating, maintenance and general expenses incurred in operation of such metering and regulating stations. The first group was allocated to each customer in the ratio which the investment for each customer bore to the total investment in such facilities to serve all customers. The second group was allocated on the basis of the number of stations (R. IV, 2335–2337, 2384; R. V, 2442–2443).

All costs related to the production system (including return, depreciation and depletion on leases and wells) were treated as volumetric, and a well-head unit cost developed per Mcf. These costs were allocated to customers in proportion to the number of Mcf's delivered to each customer in the year 1939. Similarly, a unit cost per Mcf was developed for gathering-system costs, which was apportioned to customers on an annual Mcf sales basis (R. IV, 2329; 2382; See Schedule F of Appendix B, *infra*). The residual refining credit was separately determined for each market, because residual refining operations are carried on in three separate gasoline plants, each of which processes gas transmitted to one of the three markets, viz., (1) the market served intrastate within Texas, (2) the markets served from the Denver pipeline, and (3) markets served by Natural Gas

Pipeline Company (R. IV, 2331, 2382–2383; see Schedule 1 of Appendix B, *infra*).

The transmission costs of the Denver line, totaling $2,241,432, were separated between volumetric costs ($727,908) and capacity costs ($1,513,524) (R. IV, 2333, 2383–2384; see Schedules 1 and 4 of Appendix B, *infra*). Briefly, all Denver line transmission costs were classified as capacity costs except that (1) all compressing system supplies and expenses, maintenance of compressing system equipment and accruals for depreciation of compressing station equipment were classed as volumetric, and (2) 50% of the return and income taxes on the Denver line, and operating labor on the compressing system, were classed as volumetric and 50% as capacity (R. IV, 2333). The rental of $230,507 paid by Canadian to Texoma Natural Gas Company for the use of the latter's line to transport gas to Gray, Oklahoma, for delivery to Colorado for resale to Natural Gas Pipeline Company, was allocated entirely to such sale (R. IV, 2317, 2384).

The propriety of the Commission's action in adopting the foregoing method of allocation presented by its staff engineer is further apparent from a brief consideration of the inherent defects in the two methods of allocation which petitioners submitted.

Under petitioners' first method the cost of service to the wholesale customers was determined on

the basis of what it would have cost to construct and operate a hypothetical substitute pipeline to serve only such customers.[39] Under this method all the gas sold to industrial customers during off-peak periods would be given free transportation through the pipeline. Yet, as petitioners' witness admitted, a pipeline to serve only the wholesale customers would never have been built (R. II, 1089–90; 1098–1101; R. III, 1743–1744).

Petitioners' second method was equally unsound. Under this method the total cost of service would be allocated between the wholesale customers and the direct industrial customers on the basis of the ratio between (a) the cost of constructing and operating a pipeline of sufficient diameter to serve only the wholesale customers and (b) the cost of constructing and operating a larger pipeline having sufficient diameter to meet the requirements of all customers including direct industrials (R. IV, 2268–2273) (Exh. 316, pp. 14–22; Tr. 24,264–24,272). This method thus assumes, for purposes of allocation, that only the wholesale gas flows through the diameter nearest the center of the pipe and only the direct industrial gas flows through the balance of the pipe. Since the unit cost of constructing pipeline capacity decreases as the diameter of the pipe increases, it is clear that this method would assess

[39] R. II, 1086; R. III, 1469, 1734; R. VI, 3565; R. III, 1742; R. IV, 2144; R. VIII, 4860–4861; R. IV, 2192.

against the resale customers the initial and more costly portion of the installed capacity.[1] Thus, petitioners' witness Rhodes admitted that under this method, when 61.8% of the gas flowing through the pipeline is taken by the wholesale customers, there should be allocated to them not 61.8% of the transmission costs, but 83.5%.[2] Petitioners' second plan of allocation also assumes that the first compressor engine installed at each compressor station is entirely used to pump resale gas and therefore that all of its cost should be allocated to such resale business, the cost of only the additional units at each station being allocated between the resale and direct sale business (R. IV, 2272). Combining these assumptions with some reproduction cost estimates, petitioners' witness charged the wholesale business with 70% to 95% of the cost of compressor stations (R. IV, 2273–2275), although exhibits introduced by the same witness show that at least three of the five compressor stations on the Denver pipeline were

[1] Petitioners' witness, Rhodes, testified: "The cost of a pipe line does not vary in direct proportion to its capacity, but the cost does vary substantially in direct proportion to the diameter" (R. IV, 2270).

[2] Witness Rhodes testified: "A line of 61.8 percent capacity has, as shown on Chart II attached, a diameter of 83.5 per cent of full diameter, referred to as the diameter ratio. Accordingly, the resale gas should bear 83.5 per cent of the full cost of that part of the trunk line in which its quota is 61.8 per cent of capacity" (R. IV, 2270).

installed to enable petitioners to deliver gas to direct industrial customers on peak days.[33] Under this method, none of the cost of these three compressor stations should be charged to the resale business. Finally, it is to be noted that petitioners' second method would result in a cost of only 7.58¢ per Mcf being assigned to gas sold to direct industrials, for which Colorado receives average revenues of 13.39¢ (Ex. 140, sum of lines 8 and 11, column 7 divided by sum of lines 8 and 11, column 11; Tr. 13284), or a profit margin of 76% over such purported cost.

We accordingly submit that the Commission did not abuse its administrative discretion in adopting the method of allocation presented by its staff engineer and rejecting the methods urged by petitioners.

C. PETITIONERS' OBJECTIONS TO THE COMMISSION'S METHOD OF ALLOCATION OF COST OF SERVICE ARE WITHOUT MERIT

In addition to those mentioned above, Colorado Interstate advances several objections to the Commission's allocation (Col. Br. 41–53), in which

[33] For example, in Exhibit 316 witness Rhodes states that the peak day demand of the resale business on January 24, 1940, was 67,783 Mcf (R. IV, 2268), while in Exhibit 66 (R. II, 1169) he shows that the capacity of the line as it existed in 1929, with only the Bivins and Canyon Stations in operation, was 80,000 Mcf, or more than enough to take care of the peak demands of the resale business in 1940. Since the present rated capacity of the Denver line is now 105,000 Mcf, it is clear that the additional compressor stations were constructed since 1929 to take care of the direct industrial business.

Canadian joins (Can. Br. 73). We submit that these objections lack substance.

1. *Priority of Service.*—Contrary to Colorado's contention (Col. Br. 42–45), it is clear that the Commission gave full effect to contractual priority of resale gas over direct industrial sales to the extent it was actually exercised during the test year. Under the Commission's method, volumetric costs were apportioned on the basis of the total volume of gas taken by each customer during the test year and capacity costs were apportioned on the basis of each customer's actual receipts on the system peak day. Thus, the method fully reflected all actual curtailments of load to each customer throughout the year and on the peak day.

Moreover, the record shows that interruptions and curtailments of direct industrial customers are so slight that the Commission might well have allocated to the direct industrial customers their full volumetric share of all costs of the Denver line amounting to 46.4% of the gas delivered from such line in 1939, instead of allocating only 40.5% of such costs (R. IV, 2319). The Commission's engineer testified that sufficient capacity has been installed to provide uninterruptible service to the industrial customers (R. V, 2439–2440), and that practically all of petitioners' customers have received almost continuous service as a result of petitioners' policy of increasing the capacity of

the system as the anticipated demands of all customers increased (R. V, 2439–2440).[34]

Petitioner's statement (Col. Br. 8, 9, 42) that priority and preference provisions in contracts had operated in favor of the domestic customers on 40 different occasions, is inaccurate. The record shows (R. II, 1025–1028) that during the 12½-year period from the commencement of operations on June 19, 1928, to December 31, 1940, natural-gas deliveries from the Denver pipeline were reduced or completely interrupted only 15 times. The Company calculates its "forty occasions" by multiplying each date of interruption by the number of customers who were interrupted (R. II, 1025–1028).[35] The record shows that de-

[34] For example, Colorado Portland Cement Company, a direct industrial customer, is served under an agreement (R. II, 955) which provides that service will be supplied during the months of November to February, inclusive, only when the Colorado Company "has gas and capacity available." Yet, deliveries to this customer have been reduced only 117 hours during the entire ten-year period of service, and service has been completely interrupted only 36 hours, due to a break in the branch line to such customer's plant. At all other times, the Cement Company has received full and complete service (see Appendix C, *infra*).

[35] For example, R. II, 1027 shows that service to Colorado Wyoming Gas Company and Atchison, Topeka and Santa Fe R. R. Co. was interrupted on June 1, 1937, and June 2, 1937, for 32 and 49 hours, respectively. This was one consecutive period of interruption. Petitioners call this "two occasions." Again, R. II, 1027–1028 shows that service to Arkansas Valley Natural Gas Company, Citizens Utilities Company, American Crystal Sugar Company, Atchison, Topeka and

spite physical failure of facilities and high demands, full and complete service has been rendered to customers from 99.79% to 99.99% of the time they were connected to the Denver pipeline. (See Appendix C, *infra.*)

It is clear from the testimony of Company engineer Rhodes, who participated in designing the Denver line, that such line was originally designed for carrying the loads of both the domestic and industrial customers (R. IV, 2260). As additional capacity was required to meet the peak loads of both classes of customers, additional compressor facilities have been installed. The daily capacity of the Denver pipline was 80,000 Mcf in 1929 and 1930 (R. II, 1109). The actual peak-day deliveries to resale customers 10 years later, in January 1940, from that line were 67,783 Mcf (R. IV, 2269) and would have been only 79,835 Mcf at an assumed mean temperature of 15 degrees below zero, according to petitioners' estimates (R. II, 2269). Thus, in 1940 the peak-day load of all resale customers was less than the capacity of the line as it existed in 1930. During the ten-year period 1930–1940 two of the original compressor stations on the pipeline were enlarged

---

Santa Fe R. R. Co., and Veterans Administration Facility were interrupted for periods varying from 8 to 13 hours on September 9, 1937, due to a washout on the Arkansas Valley lateral which serves all these customers. In their brief, petitioners designate this single interruption of service to five customers as "five occasions."

and three more compressor stations were added,[36] thereby enabling petitioners, on the peak-day in January 1940, to deliver not only 67,783 Mcf to resale customers, but in addition 47,343 Mcf to direct industrial customers, or a total of 115,126 Mcf (Exh. 316, p. 12; R. IV, 2269). It is apparent, therefore, that if petitioners had not intended to deliver gas to direct industrial customers on peak days, they would not have installed such additional compressor facilities between 1930 and 1940.

2. *Transmission Line as a Unit.*—There is also no merit in petitioners' contention that the Commission erred in treating the Denver line and its laterals (branch lines) as a unit, because certain laterals, metering stations and associated equipment are used exclusively for making either regulable or nonregulable sales and the balance of the property is used in common in varying degrees by both classes of business (Col. Br. 45–47; Can. Br. 76–83).

With respect to metering stations and associated equipment used exclusively in the service of individual customers, the return, depreciation, and taxes on the investment in such equipment, as

[36] Allowance was made by the Commission in petitioners' rate bases for future capital additions, including an additional compressor station to be installed on the Denver pipeline, making a total of six stations, and thereby allowing for the cost of further increases in capacity of the line (R. I, 162–164).

above stated, were allocated in the ratio that the investment for each customer bore to the total investment in such facilities. Thus, such costs were assessed on the basis of use by each customer.

While the laterals were not segregated, it is apparent from petitioners' own evidence that if the Commission had made such a segregation more costs would have been assigned to the direct industrial customers, since the laterals are used more extensively by the direct industrial customers than by the resale customers.[37]

Moreover, the Commission's treatment of the Denver line as a unit was reasonable and is supported by substantial evidence. In *Wabash Valley Electric Co.* v. *Young*, 287 U. S. 488, 497, this Court held that "normally" the unit for rate-making purposes is "the entire interconnected operating property of a utility used and useful for the convenience of the public in the territory served, without regard to particular groups of consumers or local subdivisions." That case approved an allocation apportioning the average generating

[37] According to company witness Rhodes' Exhibit 316, Statement No. 10-B (Tr. 24,308), 67% of the gas delivered through the laterals on the peak day of 1939-1940 winter was sold to direct industrials. Mr. Rhodes apportioned 50% of such laterals to Colorado Interstate's regulable sales and 50% to its nonregulable sales, thereby demonstrating that the most the Company has claimed is that such laterals are used 50-50 by both classes. The Commission allocated only 40.5% of the transmission costs (including laterals) to the direct industrial or nonregulable sales (see Appendix B, *infra*).

and transmission costs of a large interconnected electric system which operated in a territory comprising thirteen counties and sold electric current to approximately fifty cities and towns and to affiliated utilities for subsequent distribution in many other towns and cities. Under such method, there was allocated to the city of Martinsville a proportionate part of the total value of the general generating and transmission system "on the basis of the ratio of actual sales of Kw. H. to Martinsville and its consumers to the total sales of Kw. H. by plaintiff during the year 1929" (Id., 499).

The Denver line is 340 miles in length, having its most important and one of its indispensable markets in Denver at the very end of the line. The pipeline admittedly (Col. Br. 44) would not have been built and the various communities and customers along the route of the line would not be receiving natural-gas service from the project, were it not for the Denver resale market and the Colorado Fuel & Iron Company's direct industrial market (R. I, 142, 437).

Some 20,904,344 Mcf, or 98% of the total 21,364,223 Mcf delivered from the Denver line in 1939, was delivered in the State of Colorado after the gas had been transported along the main pipeline 200 miles, and after passing through at least three of the four compressor stations at such time (R. II, 1079, 693; R. IV,

2319). Moreover, the volumetric load center of the Canadian-Colorado Interstate pipeline system is at a point approximately half way between Denver and Pueblo (R. V, 2427). Accordingly, it was reasonable to determine the transmission costs for the pipeline as a whole and not on a mileage demand basis. Cf. *Columbus Gas & Fuel Company* v. *Public Utilities Commission*, 292 U. S. 398, 408–409. Significantly, Colorado Interstate's existing rate structure gives recognition to the propriety of this procedure, because its basic rates for gas sold at the Pueblo, Colorado Springs, and Denver "city gates", are identical (Exh. 262, Table R–9, Sheet 1; Tr. 23,514), although gas delivered to Denver is transported 110 miles farther and through one more compressor station than gas delivered to Pueblo (R. II, 693). As the Commission engineer testified, the various parts of the Denver transmission system are "so interwoven that it is not reasonable to segregate" them (R. IV, 2399).

Certain incidental contentions which petitioners advance in this connection may be briefly noted. Canadian's contention that the Commission made an erroneous allocation of costs in determining the cost of service for intrastate gas sold by it from the Denver line to Amarillo Oil Company for resale to the towns of Dalhart, Hartley and Texline, Texas (Can. Br. 80–81) also lacks substance. Only 378,912 Mcf of gas was sold for

1. The order of the Commission, sustained by the Circuit Court of Appeals, which was based upon a purported finding of the Commission as to the original cost of petitioner's property, or its prudent investment therein, cannot possibly result in just and reasonable rates when a portion of such cost (in this case $1,000,000) was eliminated, and the decision of the Circuit Court of Appeals is in conflict with the decisions of this Court, and particularly is in conflict with Federal Power Commission v. Hope Natural Gas Co., 320 U. S. 591. (No. 1 of Questions Presented, p. 2; Statement pp. 4 to 9.)	17

PAGE

2. The Commission in the companion case, as shown in Canadian's petition for certiorari, reduced the cost of gas sold to petitioner by Canadian under the contract in the amount of $551,000 per year. Any modification of this reduction must result in a corresponding reduction in the $2,065,000 annual reduction ordered in petitioner's rates. (No. 2 of Questions Presented, p. 2. Statement, pp. 9 and 10.) 21

3. The order of the Commission, sustained by the Court, does not allow sufficient annual depreciation to enable petitioner to recover its investment within the life of the project. (Nos. 3 and 4 of Questions Presented, pp. 2 and 3. Statement, pp. 10 and 11.) 22

4. The Commission could not possibly determine reasonable rates, consistently with the Fifth Amendment to the Constitution of the United States, for gas sold for resale in interstate commerce without making a separation or allocation of the property, some of which is used solely for the sale of gas not subject to the Commission's jurisdiction, and the remaining amount is used jointly for making intrastate sales in Texas and interstate sales for both resale and direct sale gas. It made no such allocation or separation, and its "allocation of cost of service" is not a valid substitute, and even if valid in principle, reasonable rates could not be determined because of the various errors in its application. (Nos. 5 and 6 of Questions Presented, p. 3. Statement, pp. 11 to 15.) 23

(a) The decisions of this Court require a separation of property, which the Commission admitted it did not make, and the approval of its action by the Circuit Court of Appeals was erroneous 24

(b) Even if the Commission's "allocation of cost of service" is a valid substitute for the separation of the property itself and could be approved, which we deny, no end result formula, such as approved in the Hope Case, can possibly cloak the flagrant errors in its application to our case 28

COLORADO INTERSTATE GAS COMPANY, a corporation, PETITIONER,

v.

FEDERAL POWER COMMISSION, CITY AND COUNTY OF DENVER, COLORADO, PUBLIC SERVICE COMMISSION OF WYOMING, COLORADO-WYOMING GAS COMPANY, PUBLIC SERVICE COMPANY OF COLORADO, and CANADIAN RIVER GAS COMPANY, RESPONDENTS.

PETITION FOR WRIT OF CERTIORARI TO THE UNITED STATES CIRCUIT COURT OF APPEALS FOR THE TENTH CIRCUIT, AND BRIEF IN SUPPORT THEREOF.

To the Honorable the Chief Justice and the Associate Justices of the Supreme Court of the United States:

The petitioner herein respectfully prays for a writ of certiorari to review the judgment of the United States Circuit Court of Appeals for the Tenth Circuit entered July 8, 1944, (R. V. 8, p. 5094) affirming an order of the Federal Power Commission under the Natural Gas Act of 1938 (52 Stat. 821; Title 15, U.S.C.A., Sec. 717) which order reduced by $2,065,000 per annum the rates or charges for natural gas charged by petitioner to distributing companies for wholesale deliveries of gas at various city gates in Colorado.

OPINIONS BELOW.

The opinion of the Federal Power Commission will be found in R. V. 1, p. 140, and is reported in 43 P.U.R. (N. S.) 205. The opinion of the Circuit Court of Appeals will be found in R. V. 8, pp. 5066-5094 and is reported in 142 Fed. (2nd) 943.

JURISDICTION.

The jurisdiction of this Court is invoked under Section 19(b) of the Natural Gas Act (52 Stat. 821; Title 15, U.S.C.A., Sec. 717(r)) and Section 240a of the Judicial Code as amended by the Act of February 13, 1925, (Title 28, U.S.C.A., Sections 346 and 347).

STATUTE INVOLVED.

The pertinent provisions of the Natural Gas Act of 1938 (52 Stat. 821; 15 U.S.C.A., Sec. 717) are set forth in Appendix A *infra*, pp. 33 to 35.

QUESTIONS PRESENTED.

1. Whether the Commission consistently with the requirements of the Fifth Amendment to the Constitution of the United States and the Natural Gas Act in fixing rates purporting to yield no more than a fair return on the cost of petitioner's property as adjusted by Commission accountants can eliminate from such cost rate base the actual cost to petitioner of certain contracts used and useful and necessary in petitioner's business, and did the Commission's action in so doing create an arbitrary and unreasonable result?

2. Whether the Fifth Amendment to the Constitution of the United States and the Natural Gas Act require a decrease in the ordered reduction of $2,065,000 in the event that Canadian River Gas Company (hereinafter called "Canadian"), in a companion case, which is filing a petition for certiorari simultaneously with the filing of this petition, obtains a reversal or modification of the Commission's order reducing its rates.

3. Whether the finding of the Commission as to the life of Canadian's reserves which form the basis for the

determination of annual depreciation expense is arbitrary, unreasonable and unsupported by substantial evidence.

4. Whether the Commission's action in fixing the annual depreciation expense on the basis of service lives proposed by the Commission's staff which prevents petitioner from recovering its investment during the economic life of the business in view of the over-all life of the whole Panhandle Field of 27 years from 1939 is an end result which confiscates petitioner's investment in violation of the Fifth Amendment to the Constitution of the United States and the Natural Gas Act.

5. Whether consistently with the requirements of the Fifth Amendment to the Constitution of the United States and the Natural Gas Act the Commission could determine reasonable rates for gas sold for resale in interstate commerce without making a separation or allocation of the property of Canadian and petitioner which, in this case, is used in making intrastate sales in Texas and interstate sale of both resale and direct sale gas, the Commission having no jurisdiction over intrastate sales or over direct sales in interstate commerce to industrial consumers.

6. Whether the Commission's substitute method of allocation of cost of service which results in burdening non-regulable gas with costs actually chargeable against regulable gas violates the Fifth Amendment to the Constitution of the United States and the Natural Gas Act.

STATEMENT.

This petition for certiorari is being filed simultaneously with a like petition by Canadian, and the two petitions are made on a joint printed record in the Circuit Court of Appeals. Accordingly, they may be said to be companion cases, and, furthermore, the Commission treated the properties of the two Companies as a unit.

The Commission's opinion and order, using what it termed a prudent investment rate base and an annual rate of 6½ per cent, found petitioner's rates unreasonable by $2,065,000 and ordered a reduction in rates by that amount. In order to arrive at this result it was necessary to:

(1) Eliminate from consideration in the rate base the actual unamortized cost of certain contracts paid for by petitioner in stock and deprive petitioner of any annual allowance for the amortization thereof,

(2) Deny to petitioner an adequate annual accrual for depreciation, thereby making it impossible for petitioner to recover its investment by the end of the economic life of the business,

(3) Refuse to make a fair and proper allocation of petitioner's property used in the regulable part of its business which is necessary to avoid encroachment upon the non-regulable business, and

(4) Adopt a scheme of cost allocation that deprives petitioner of earnings upon its non-regulable business contrary to the expressed mandate of the Natural Gas Act and to the Fifth Amendment to the Constitution of the United States.

Historical Statement.

Canadian owns a large natural gas producing property in the Panahandle Field in Texas. It is engaged in the production of gas and transports gas through its own 22" pipe line from Bivins Station in the Field to a point near Clayton, New Mexico, a distance of some eighty-six miles. There its pipe line connects with the 22" Denver pipe line of petitioner and there the gas is delivered to petitioner. Petitioner then transmits the gas through its pipe line to points in Colorado, with the terminus near Denver, a distance of approximately 254 miles. Sales of gas are made in Colorado both to privately and publicly owned distribution systems for resale, and directly to industrial customers for consumption. All of Canadian's production, except for a relatively small quantity sold for distribution in Texas and New Mexico, is purchased by petitioner.[1]

The history of the gas field, which is of great importance

[1]Petitioner also sells to Natural Gas Pipeline Company of America 25 per cent. of that company's requirements for its pipe line serving the Chicago area. Delivery of this gas is made in Oklahoma through leased capacity in a pipe line of Texoma Natural Gas Company, which furnishes the other 75 per cent.

in connection with the questions raised in this petition, as well as that of Canadian, will be quite fully stated in Canadian's petition. We ask the Court to consider these two petitions together, and we refer to and rely upon certain portions of Canadian's petition and brief rather than indulge in repetition.

In 1918, in the never-ending search for oil, a local Texas company, Amarillo Oil Company (hereinafter called "Amarillo Oil"), drilled a wildcat well in the Texas Panhandle Field. As happens frequently, the well came in as a gas well, and thus there was discovered what has subsequently been developed into one of the largest producing natural gas fields in the United States. The acquisition of acreage in the search for oil continued, and by 1924 Amarillo Oil owned in excess of 300,000 acres of natural gas leaseholds in the Texas Panhandle Field, which had been acquired in the first instance in the search for oil.

As would be expected, the original prices paid for these wildcat leases were nominal, reflecting the unproven character of the area. The purpose of the investment was to develop an oil field. It was not made as a project to serve the public with natural gas.[2] But since the wells drilled proved up a large gas reserve, the problem of marketing the gas had to be solved. Local markets were exceedingly small, and could have been served with one well.

Through certain corporate reorganizations Amarillo Oil had become a subsidiary of Southwestern Development Company (herein called "Southwestern"), all of the stock of which was owned by the interests which had acquired and developed the original leases and wells held by Amarillo Oil. It then undertook to find some method of marketing the gas. It had no means of its own with which to finance any long pipe line projects, and, furthermore, had had no experience with such projects, so it approached Standard Oil Company (N. J.) (hereinafter called "Standard") which had financial resources and had had considerable experience in long pipe line projects. Cities Service Company (hereinafter called "Cities Serv-

[2]This fact is important, in view of the action of the Federal Power Commission in throwing out the cost to Canadian of these leaseholds and wells and the cost to petitioner of its gas purchase contract.

ice") was also called in on the negotiations, because it owned the Public Service Company, which was then distributing manufactured gas in Denver, and controlled the Pueblo Gas and Fuel Company, then distributing manufactured gas in Pueblo. A franchise to distribute natural gas had to be obtained in Denver to make the project feasible, and, furthermore, the two distributing plants, in Denver and Pueblo, had to be converted into plants capable of distributing natural gas at higher uniform pressures than had been required for the manufactured gas. Neither of these three parties had any interest in either of the others. (R. V. 1, pp. 613, 622.) *They dealt at arm's length.* Southwestern was perfectly free to put its gas leaseholds and wells into the project and sell gas at cost or not, and, if it did, to insist upon its price being paid. Standard was free to finance the project or not, depending upon whether satisfactory terms could be agreed upon. Cities Service was free to say that its subsidiary distributing companies would go to the expense of converting their distribution systems to natural gas, and to enlarge these systems to take care of the contemplated increased use of natural gas for house heating, or to continue to distribute manufactured gas. These three parties finally, and after long negotiations as to the means of carrying out the project, entered into an agreement entitled "Memorandum of stipulations agreed upon between Southwestern Development Company, Cities Service Company and Standard Oil Company (New Jersey)". (Exhibit 1, R. V. 1, p. 381), which was signed April 5, 1927, conditioned upon the granting of a natural gas franchise to the Public Service Company in Denver, and the fixing of rates to be charged by Public Service Company on such basis as would make the project feasible. (R. V. 1, p. 394.)

Cost to Petitioner of Certain Contracts.

It was agreed that in order to carry out the project Southwestern would form and own what they then referred to as the "Texas Producing Company" (Canadian), and would cause its wholly owned subsidiary, Amarillo Oil, which then had the title to the leaseholds, gas wells and equipment, (R. V. 1, p. 381) to convey these properties to Canadian for a consideration of $5,000,000 (R. V. 8, p. 5069). Southwestern

was to form what they called the "Texas Connecting Company" for the purpose of making deliveries of gas for the project (R. V. 1, p. 383); however, one company to perform the functions of both the producing company and the connecting company could be formed (R. V. 1, p. 401), and that is what actually happened in the formation of Canadian. This project Agreement provided that these gas leaseholds and wells, except for certain intrastate sales in Texas, would be reserved for the Denver line project and that no contract for the sale of natural gas would be made nor anything done that might impair the capacity to fulfill the deliveries of natural gas thereunder for the full term of the Gas Purchase Agreement to be made. (R. V. 1, p. 384).

It was agreed that Standard, in order to carry out the project, was to form a company, designated in the agreement the Colorado Company, which later became your petitioner, Colorado Interstate Gas Company (R. V. 1, p. 385; V. 2, pp. 625-641), and your petitioner was to construct a pipe line from the point of connection with Canadian's line, at a point near Clayton, New Mexico, to Denver via the city gates of Pueblo and Colorado Springs. It was agreed that Canadian, under a contract for the full term of the project, would sell gas to petitioner on a cost basis in consideration for which petitioner was to issue part of its preferred and common stock. Petitioner was to sell such gas to Public Service Company under a definitive contract to be made in accordance with the terms already agreed upon. Similar sales contracts were to be made by petitioner with Pueblo Gas and Fuel Company and with Colorado Springs, if the Public Service Company could buy the distributing system at that place. (R. V. 1, p. 387.) In addition, it was agreed that petitioner was to sell gas directly to Colorado Fuel and Iron Company, which was a necessary prerequisite to make the project economically feasible (R. V. 1, pp. 493, 519), and a few other industrial customers under interruptible contracts, for industrial use, subject to the prior demands of the domestic consumers. (R. V. 1, pp. 390, 391.)

Cities Service was to cause its subsidiary distributing companies to convert the systems used to distribute manufactured gas into systems to distribute natural gas, and to make such additions and changes in the distribution plants

which would be required for the contemplated increased use of gas for house heating as well as for domestic purposes. (R. V. 1, p. 390.) It also agreed to furnish engineering and commercial advice in connection with the project.

Standard agreed to purchase a portion of the common and preferred stock of petitioner, and also to advance to petitioner cash with which it in turn could purchase for cash the bonds of Canadian.[3] (R. V. 1, pp. 394-398.) Standard organized the Colorado Company and purchased for cash 531,250 shares (42½% of the total) of its common stock for $1,000,000, and 10,000 shares (50%) of its $100 par value 6% preferred stock, for which it paid $1,000,000 in cash (R. V. 2, pp. 626-630). As agreed upon in the project Agreement, there was issued simultaneously by petitioner to Southwestern, as the nominee of Canadian in consideration of Canadian's execution and delivery of its contract to produce, gather, transport and sell gas to the project at cost, 531,250 shares (42½%) of petitioner's common, and 10,000 shares (50%) of its preferred stock (R. V. 2, pp. 627-629), which was recorded and charged on the books of petitioner in the total amount of Two Million Dollars, being exactly the amount simultaneously received by petitioner for the sale of a like amount of stock to Standard for cash. (R. V. 2, p. 627; V. 3, pp. 1439-1440.)

Also as agreed there was issued simultaneously to Cities Service for causing its subsidiaries to change over to the distribution of natural gas, and for the other considerations stated above, 187,500 shares (15%) of petitioner's common stock (R. V. 2, pp. 628, 629; V. 3, pp. 1439, 1440), which was likewise recorded on petitioner's books at $352,941.17, being on the same basis as the stock sold for cash to Standard (R. V. 2, p. 628).

Petitioner contended that in any determination of original cost the unamortized portion of the cost of these contracts paid for in stock issued to Southwestern and Cities Service should be included, but the Commission denied such contention and refused to include in original cost or prudent investment any of such costs. At the time of the hearing,

[3]As finally financed, Standard bought substantially all of petitioner's bonds, as well as the portion of common and preferred stock referred to next. (R. V. 1, p. 496.)

the unamortized portion of such cost (and that was all the petitioner contended should be included) was $1,000,000. (R. V. 3, p. 1749.)

There was no disagreement in the evidence that the costs charged on the books for the stock payments to Southwestern and Cities Service were on the same basis as the cash simultaneously paid by Standard for a like amount of stock. (R. V. 3, p. 1440.) The Commission witness agreed that this was the best evidence as to the value of the stock at that time. (R. V. 3, p. 1437.) He also agreed that the transaction was the same as if cash in these amounts had been paid for the contracts and then stock had been purchased with that cash.[4] (R. V. 3, pp. 1443-1444.)

There was no evidence whatsoever that the payments for these contracts were excessive, or that the consideration received was inadequate. Neither was there any evidence, nor could there be any evidence, that the agreement for Canadian to sell the gas at cost, was of any less value than the payment made therefor. Neither was there any evidence that the undertakings on the part of Cities Service for its part in the launching of the project was of less value than the stock paid therefor. Notwithstanding these facts which were not disputed by the Commission (R. V. 1, pp. 152-154) and which the Court stated in substance (R. V. 8, p. 5082), the Commission and the Court wholly disallowed these items as an "unjustified and fictitious increase of book cost of plant" (R. V. 1, p. 153; V. 8, p. 5082).

Reduction in Cost of Gas.

A part of the reduction of $2,065,000 per year ordered by the Commission as against your petitioner is based upon a reduction ordered in the Canadian case in the price of gas sold by Canadian to petitioner in the amount of $551,000 per annum. In the companion case involving Canadian, it is contended that the Commission and the Court erred in ordering and approving this reduction in the cost of gas, and should Canadian be sustained in its contention that this

[4]The Commission did allow as part of original cost or prudent investment the unamortized portion of the cost of a contract for the sale of gas at the city gate at Colorado Springs in the amount of $118,061 paid in cash. (R. V. 2, p. 1127.)

reduction of $551,000 should not have been ordered, in whole or in part, then it would necessarily follow that the $2,065,000 reduction should be reduced accordingly, and this is a very special reason why, as already indicated, the two petitions for certiorari should be considered together.

Annual Depreciation Expense.

Annual depreciation expense was determined on the service life formula. (R. V. 1, p. 160.) The Commission's engineer testified as to the service lives of the various items of property. He assigned a 50 year life to the main pipe line; a 48 year life for most of the structures; a 36 year life for the compressors, and shorter lives for the other items of property entering into the plant. In determining the service lives he stated it was necessary to take into account the life of the field, or the economic life of the project, and he testified that it was necessary to indulge the assumption that the company could continue in business and use the plant not only up to the end of the 50 year life which he had assigned to the main line, but also for a period of six to ten years beyond. The 50 year life would expire in 1978, and accordingly his assumption was that the economic life of the field will extend until 1984 or until 1988. This was based upon the testimony of Commission staff witnesses which the Commission actually did not accept. The reason for assuming that the economic life of the field would be six to ten years longer than the 50 year period assigned as the life of the main pipe line was, as he stated, in order that necessary additions to the plant and property made in the latter part of the service lives could be recovered by depreciation allowance over such additional period of time. (R. V. 3, p. 1760.)

In the companion case Canadian makes the contention that the finding of the Commission as to the remaining life of its recoverable reserves is not supported by any substantial evidence, and that the true life of its recoverable reserves is much shorter than that found by the Commission, and must be based on the economic life of the Panhandle Field as a whole, not on Canadian acreage solely. The life of the entire Panhandle Field, on the basis of the Commission witness's estimate of recoverable reserves adjusted to a fifty

pound abandonment pressure and divided by the estimated annual production from the field as a whole, does not exceed twenty-seven years from December 31, 1939, (R. V. 1, p. 157; V. 7, p. 3701; V. 8, pp. 4638-46). Petitioner makes the same contention and if it be sustained then the necessary result is that the petitioner will be unable to recover its investment during the true economic life of petitioner's business. The Commission recognized that the life of the enterprise must be longer than the service life of any major unit of property. Thirty-eight years from 1939 was assigned to main line pipe so that a twenty-seven year life under the Commission's own theory will not permit a recovery of petitioner's investment (R. V. 1, pp. 159-161).

Allocation of Property Between Regulable and Non-regulable Business.

Only a portion of the gas sold by petitioner is subject to the jurisdiction of the Commission. All gas sold direct to industrial customers is free from price regulation. Gas sold in intrastate commerce by Canadian is also free from regulation. This situation requires a determination of costs properly chargeable against the regulable sales. The Commission acknowledged this duty (R. V. 1, pp. 174-177).

The Commission witness and the Commission itself admitted that no separation or allocation of the property was made as between interstate and intrastate business, nor as between resale gas subject to the Commission's jurisdiction and direct sale industrial gas not subject to the Commission's jurisdiction (R. V. 1, p. 175). The Commission found that this was not necessary, and substituted what it called allocation of cost of service, which took into account the cost of operation, as determined by it, plus a return, as determined by it.

The Commission's Allocation of Costs.

Where, as here, all sales are not subject to Commission jurisdiction, if the method of allocation used unfairly burdens the gas unregulated, sold to industrial customers for consumption, then the result of the Commission's action is to take from petitioner the earnings of its unregulated

business, contrary to the intent of the Natural Gas Act, and give them to the customers who purchase gas for resale. This results in confiscation and, in fact, follows from the so-called allocation used by the Commission in this case. The Commission did not discuss the details of its allocation and we must examine the testimony for enlightenment as to the basis of the allocation followed by the Commission (R. V. 1, pp. 175-176).

In making the allocation the Commission treated the properties of Canadian and petitioner as a unit, combining costs and operations. The accounting witnesses for the Commission made adjustments by way of deduction in the original cost and adjusted downward each company's operating expenses. Then another accounting witness consolidated all of the revised accounts of the two companies, as if the two companies were one, reflecting in such consolidated figures all of the adjustments theretofore made with respect to each company separately. (R. V. 4, pp. 2215-2259.) This was set up as Exhibit 185. (R. V. 4, pp. 2215-2244.)

The engineering witness then took this Exhibit 185 which showed the combined gross income of the two companies, with the amount paid by petitioner to Canadian for gas under the contract eliminated. (R. V. 4, p. 2246.) This combined gross income included the income received by Canadian from its intrastate sales in Texas (R. V. 4, p. 2249), and it included the income from all direct sale industrial or unregulated business of both companies. (R. V. 4, p. 2229.)

This engineering witness admittedly made no separation either as between the property devoted to intrastate and that devoted to interstate business, or as between that used in selling gas for resale and that used for direct sales not subject to regulation. (R. V. 4, pp. 2317-2373.) He gave no consideration to the fact that resale gas had priority over direct sales to industrial customers, and that the system had been built and maintained on that basis. (R. V. 4, pp. 2390-2397.) He admitted that the load factor of gas delivered into the Denver line and into the Chicago line of Natural Gas Pipeline Company of America was of conse-

quence in determining cost, and that the load factor on the Chicago line was 95%, whereas it was somewhere between 60% and 70% on the Denver line. Nevertheless, he gave no consideration whatever to the load factor. (R. V. 4, pp. 2390, 2391; V. 5, pp. 2414, 2415.)

In allocating his transmission costs the witness treated as a unit, and as if it were one common conduit used by all gas, all the transmission system, beginning with and including:

(1) Canadian's Bivins Compressor Station in the field and its transmission line from that point in Texas,

(2) All laterals used in making intrastate deliveries in Texas, whether direct sale industrial gas or sales of gas to Texas distributing companies, and

(3) All of petitioner's transmission line to Denver with all of its laterals, even though some laterals were used exclusively in delivering direct sales gas to industrial customers. This complete transmission system, consisting of four compressor stations and 340 miles of pipe lines, was treated as a unit or one conduit.

The witness discussed the Commission's flow map reproduced as Appendix B (R. V. 2, p. 1079), in reference to which it appeared that of the 21,594,112 Mcf of gas which passed through the Bivins station in 1939, 7,257,379 Mcf were sold directly to Colorado Fuel and Iron Company at Pueblo as a direct sale, not subject to regulation, and that this gas made no use whatever of his assumed unit or common transmission system from Pueblo to Denver, a distance of 105 miles. It also appeared from the flow map that 1,676,091 Mcf for the same year constituted direct sales to the Colorado Portland Cement Company, slightly north of Pueblo, and that the 20-inch pipe line from Pueblo to Denver, in contrast to the 22-inch pipe line south of Pueblo, was used almost exclusively by the resale or regulated gas. The witness admitted that in computing his "volumetric cost" component of his total transmission cost he gave no consideration to such facts, and admitted, of course, that consideration of such facts would produce a different result. In transmission costs, a large factor is

the number of times the gas is compressed at the several compressor stations. In deriving his cost he gave no consideration to the number of times the gas had to be compressed before it was delivered to the respective customers. (R. V. 4, pp. 2396-2399.) He admitted that for every thousand cubic feet taken from the line the volumetric factor of three cents plus was applied, whether the gas left the line at Dalhart, Texas, only a few miles from the field, or whether it was transmitted all the way to Denver (R. V. 5, p. 2425). He also admitted that although gas going to Denver is compressed four times he did not allow any greater expense than for the gas leaving the line after one compression only. (R. V. 5, p. 2448.) He gave no consideration to the fact that the industrial customers had a shut off provision in each of those contracts, nor did he give any consideration to the numerous shut offs that had been made in the course of the company's experience. (R. V. 5, p. 2439.) He gave no consideration to the relative or prior use of the line which the regulated business might demand over the unregulated on the coldest day expected, but merely took deliveries of regulated and unregulated gas as they happened to occur on February 9, 1939, which he called the system's peak delivery day for that particular winter. (R. V. 5, pp. 2434-2436; V. 4, p. 2319.) In making his division of all costs he treated all of the gas as if it entered the transmission system or common conduit at Bivins, and as if such gas used or was transmitted through every part of such unit transmission system, and all came out at one common vent at Denver. (R. V. 5, pp. 2422-2448; V. 4, pp. 2317-2373.)

After deriving such allocated cost in the manner indicated, he then compared these allocated costs with the actual revenues received in 1939 from each customer, including both regulated and unregulated sales, substracted one from the other, and thus derived the amount of the recommended reduction.

This, in brief, was the testimony, and the only testimony, upon which the Commission attempted any allocation at all, and by this method the Commission arrived at the ordered reduction in rates. This method departed from

the requirements of the decisions of this Court, saying emphatically that there is a jurisdictional necessity for an allocation or separation of *property* which is jointly used in interstate and intrastate commerce, and this jurisdictional necessity is just as apparent where property is jointly used for resale gas (subject to regulation) and direct sale gas (not subject to regulation).

Petitioner put in full and complete testimony showing the correct allocation of petitioner's property between that used in carrying on the regulated business and that used in selling gas to industries for consumption. This was completely disregarded by the Commission (R. V. 1, p. 175).

REASONS FOR GRANTING THE WRIT.

1. The Circuit Court of Appeals has decided Federal questions under the Natural Gas Act in a way probably in conflict with applicable decisions of this Court.

2. The Circuit Court of Appeals has decided important questions of Federal law arising under the Natural Gas Act which have not but should be settled by this Court.

3. The Circuit Court of Appeals has so far departed from the accepted and usual course of judicial procedure as to call for an exercise of this Court's power of supervision.

CONCLUSION.

For these reasons, stated more fully in the attached brief, it is respectfully submitted that the writ should be granted.

Attorneys for Petitioner.

BRIEF IN SUPPORT OF PETITION FOR WRIT OF CERTIORARI.

I.

THE OPINIONS BELOW.

Reference to the opinion of the Commission and of the Circuit Court of Appeals is made in the petition, page 2.

II.

JURISDICTION.

The statutory provisions under which the jurisdiction of this Court is invoked are shown in the petition, page 2.

III.

STATEMENT OF THE CASE.

This appears in the petition, pages 3 to 15.

IV.

SPECIFICATION OF ERRORS TO BE URGED.

Errors to be urged are those specified in the petition, pages 2 and 3, under the heading "Questions Presented".

V.

ARGUMENT.

1. The order of the Commission, sustained by the Circuit Court of Appeals, which was based upon a purported finding of the Commission as to the original cost of petitioner's property, or its prudent investment therein, cannot possibly result in just and reasonable rates when a portion of such cost (in this case $1,000,000) was eliminated, and the decision of the Circuit Court of Appeals is in conflict with the decisions of this Court, and particularly is in conflict with Federal Power Commission v. Hope Natural Gas Co., 320 U. S. 591. (No. 1 of Questions Presented, p. 2, Statement pp. 4 to 9.)

The evidence relating to the project agreement of April 5, 1927, between Southwestern, Standard and Cities Service will be found in Volume 1 of the Record at pages 381 to 596.

The evidence as to the performance under said agreement will be found in Volume 2 at pages 626 to 641, and in Volume 3 at pages 1439 and 1440, and the evidence as to the elimination of the $1,000,000 from original cost will be found in Volume 2 at page 1140 and Volume 3 at pages 1429 to 1451.

The facts are sufficiently set forth in the Statement in the petition.

The value of the contracts in question seems evident. It requires no argument to demonstrate the enormous value to petitioner of having these gas leaseholds, wells and other facilities of Canadian, obligated to produce, gather, transport and sell gas to petitioner on a preferred basis at cost for a period of twenty years and thereafter so long as petitioner shall elect. The issuance of stock by the petitioner to Southwestern was pursuant to the April 5, 1927, agreement and was the consideration expressly provided for Southwestern's agreement that it or its subsidiary (1) would hold in reserve and drill and develop the natural gas acreage in the Panhandle Field of Texas then held by Southwestern's subsidiary (Amarillo Oil) under leases or in fee; (2) to supply such gas to petitioner for the Denver project with priority over all other demands except certain intrastate sales in Texas, for which Southwestern or its subsidiary (Amarillo Oil) was already committed; and (3) to sell gas to petitioner during the whole project period at cost. (R. V. 1, p. 384.)

Neither does it require any argument to show the great value to petitioner of the rights obtained from the contract with Cities Service for the common stock issued to it. Cities Service agreed (1) to contribute its engineering and commercial experience, advice and aid to the project; (2) to cause its subsidiary distributing companies at Denver and Pueblo, respectively, to execute firm gate rate contracts for the full project term; (3) to cause such distributing companies without expense to petitioner to make the necessary changes and extensions in their distribution systems to take care of the anticipated increased sales of natural gas, particularly for house heating purposes; and (4) to convert, also without expense to petitioner, such distribution systems into systems tight enough to distribute the drier natural gas

at higher uniform pressures. (R. V. 1, pp. 387-392, 541-542, 590, 594-596.)

Why, then, did the Commission disallow the unamortized portion of the cost of these contracts, which the evidence showed was, at the time of the hearing, $1,000,000? The Commission, after referring to the tripartite agreement of the project parties, said:

> "Very strangely, it is now represented that Canadian Company refused to negotiate an agreement for the sale of gas by it to Colorado Company unless Colorado Company turned over to it 10,000 shares of preferred stock, having a total par value of $1,000,000, and 531,250 shares of no par common stock having a recorded value of $1,000,000."
>
> R. V. 1, p. 153.

Then the Commission observed that this transaction "resulted in an unjustified and fictitious increase of book cost of plant." (R. V. 1, p. 153.)

Of course Canadian, after being organized to carry out the obligations assumed by Southwestern in the project agreement, *would refuse to proceed except upon the basis specified in the tripartite agreement.* It was bound to see to it that the common and preferred stock was issued to its parent company, Southwestern, contemporaneously with its execution of the gas purchase agreement with petitioner. What has that to do with the failure of the Commission to include this item in original cost? Why did the Commission use the words, "Very strangely", just as if this transaction between petitioner and Canadian was the original and only transaction involving the issuance of such stock? That confusion found its way also into the opinion of the Court. The Court did not question the value of these contracts or that they were essential to and used and useful in the enterprise, and did not find that the amount paid was excessive. The Court misses the point and avoids the issue, just as did the Commission with this statement:

> "• • • But, according to the records of Colorado, Canadian refused to enter into the contract for the sale of gas to Colorado, and Cities Service refused to direct or permit its subsidiaries to enter into the

> contracts for the purchase of gas from Colorado; and thereupon Colorado issued to Southwestern as the nominee of Canadian 10,000 shares of preferred and 531,250 shares of common stock, and issued to Cities Service 187,500 shares of common stock. * * *." (R. V. 8, p. 5082.)

The Court thus characterized this transaction involving the issuance of this stock:

> "* * * The record offers little or no explanation of the refusal to enter into the contracts as provided with binding effect in the Memorandum of Stipulation, or of the failure of Colorado to exact that they be entered into *without additional consideration or inducement.* * * *." (R. V. 8, p. 5082.)

It is utterly inconceivable how the Court could make this statement. The Court refers to *additional* consideration. This was not additional consideration; it was *the* consideration specified in the original contract before petitioner or Canadian had been born. Undoubtedly the Court was under the impression that petitioner issued the required amount of stock to Southwestern and Cities Service as provided in the original agreement, and then later issued additional stock, in like amounts, because Canadian, although obligated by the contract of its parent, became recalcitrant and demanded that it be paid again what had already been paid pursuant to the agreement made with its parent on April 5, 1927. The same observations might be made with respect to Cities Service.

There has never been any question as to the propriety, and, indeed, as to the necessity, when the determination of the cost of the property was undertaken, of including the cost of contracts which are used and useful in the business. *Central Kentucky Natural Gas Co. v. Railroad Commission,* 290 U. S. 264; *Duluth Street Ry. Co. v. Railroad & Warehouse Commission,* 4 Fed. (2d) 543 (affirmed 273 U. S. 625); *Bonbright v. Geary,* 210 Fed. 44; *Valparaiso Lighting Co. v. Public Service Commission,* 129 N. E. 13; *Pacific Gas & Electric Co. v. City and County of San Francisco,* 265 U. S. 403.

This well settled rule of law is recognized by the Com-

mission itself by including in original cost the cost of the Colorado Springs contract (R. V. 1, p. 152), the contract purchased by petitioner from Arthur K. Lee, which provided for the sale of gas to Colorado Springs. The unamortized portion of that contract which the Commission allowed in the rate base was $118,061. That contract was not different in kind from the contracts with Southwestern and Cities Service.

This elimination from the purported original cost or prudent investment, without any reason whatsoever, does not square with the doctrine of *Federal Power Commission v. Hope Natural Gas Co., supra.* A rate cannot possibly be just and reasonable in its consequences, or, to put it another way, it is inevitable that it must be unjust and unreasonable in its consequences when it is based upon a purported finding of original cost, and a Commission fixed return thereon, if any portion of that cost is eliminated. One million dollars cannot be eliminated under such circumstances any more than one-half or two-thirds of such cost should be eliminated. This elimination from original cost actually deprives petitioner of the right to recover through amortization the sum of $1,000,000, which represents a valid cost incurred by it in setting up the project. Likewise it deprives petitioner of a 6½% return on the sum of $1,000,000 during the first year, and on the remaining unamortized amount year by year. This result cannot be said to be an inconsequential rate impact.

This sort of thing does not involve "a formula," but the impact of the rate order. The total effect of such a rate order cannot be said to be just or reasonable, but must be said to be unjust and unreasonable under such circumstances. Accordingly, we contend that the Circuit Court of Appeals has decided questions of Federal law in a way probably in conflict with applicable decisions of this Court, particularly *Federal Power Commission v. Hope Natural Gas Co., supra.*

2. The Commission in the companion case, as shown in Canadian's petition for certiorari, reduced the cost of gas sold to petitioner by Canadian under the contract in the amount of $551,000 per year. Any modification of this reduction must result in a corresponding reduction in the $2,065,000 annual

reduction ordered in petitioner's rates. (No. 2 of Questions Presented, page 2. Statement, pages 9 and 10.)

This petitioner merely refers to this situation as a reason why the two petitions should be considered together, and in order to protect itself in the event Canadian's petition should be granted and the decision of the Circuit Court of Appeals reversed in whole or in part because of the erroneous reduction in the cost of gas.

3. The order of the Commission, sustained by the Court, does not allow sufficient annual depreciation to enable petitioner to recover its investment within the life of the project. (Nos. 3 and 4 of Questions Presented, pages 2 and 3, Statement, pages 10 and 11.)

Here the situation is disclosed in our Statement contained in the petition, and the order in this regard is contrary to clear implications of *Federal Power Commission v. Natural Gas Pipeline Company of America,* 315 U. S. 575, to the effect that there is no constitutional requirement "that the owner who embarks in a wasting-asset business of limited life shall receive at the end more than he has put into it." This clearly implies, and other decisions of this Court hold, that in such situation petitioner should have the right, so far as regulation is concerned, to receive at the end of the life what it did actually put into it.

In the companion case Canadian makes the contention that there was no substantial evidence to support the finding of the Commission that the remaining life of its gas reserves would be 53 years from 1939, and that the true life is much shorter. Canadian's petition shows that the life of the whole Panhandle Field is the limiting factor, which is no more than twenty-seven years from 1939. (R. V. 7, p. 3701; V. 8, pp. 4638-46.) Reference to that part of Canadian's petition hereby is made and upon the reasons therein stated petitioner relies in order to avoid repetition. If that contention be sustained, it necessarily follows that petitioner will not be able to recover its investment, since the Commission based its findings on an assumed life of fifty-three years which gave a margin of fifteen years beyond the service life of pipe. (R. V. 1, p. 159.)

The annual depreciation, as fixed by the Commission on such basis, is not sufficient in any event to cover the cost of replacements which will have to be made in the interim. For example: While the service life of the main pipe line was determined to be 50 years, replacements of important items of plant, such as compressors, with a service life of 36 years, are clearly not taken care of. The compressor that is replaced at the end of 36 years would be used and useful only for 14 more years, and the company would be able to get a return of that investment of only 14/36ths of its cost. This is perfectly obvious. The same is true of all other short lived items of plant which have to be replaced in the 50-year period.

Considering the hazardous character of any natural gas production and the uncertainty as to the life of gas reserves for a period of fifty-three more years, the Commission's action in postponing the possibility of recovery by petitioner of its investment for such a long time in the future is unreasonable and arbitrary. If an adequate annual allowance for depreciation is not now allowed petitioner, it may turn out that it will be impossible to recover its full investment.

4. The Commission could not possibly determine reasonable rates, consistently with the Fifth Amendment to the Constitution of the United States, for gas sold for resale in interstate commerce without making a separation or allocation of the property, some of which is used solely for the sale of gas not subject to the Commission's jurisdiction, and the remaining amount is used jointly for making intrastate sales in Texas and interstate sales for both resale and direct sale gas. It made no such allocation or separation, and its "allocation of cost of service" is not a valid substitute, and even if valid in principle, reasonable rates could not be determined because of the various errors in its application. (Nos. 5 and 6 of Questions Presented, page 3: Statement, pages 11 to 15.)

Petitioner is engaged in the sale of gas to utility companies for resale, which is subject to the Commission's jurisdiction and which is referred to as "resale gas". It also sells natural gas directly to industries for consumption, which sales are not subject to the Commission's jurisdiction,

and which are referred to as "direct sale gas". The Commission and the Court recognized in this case the necessity of making some sort of allocation as between resale gas and direct sale gas, and, of course, not to do so would arbitrarily extend the Commission's jurisdiction to transactions completely exempted by Congress. The Commission has recognized this duty in other cases. In *Re Interstate Natural Gas Co., Inc.*, 48 P.U.R. (N.S.) 267, at page 279, the Commission said:

> "Interstate's properties are used in transactions over which we have jurisdiction, as well as those beyond our jurisdiction, and they are also used to render service to customers with varying load and other characteristics. Its operating expenses likewise relate to these several phases of the company's operations. This gives rise to joint costs. It, therefore, becomes necessary to resort to allocations for the purpose of determining just and reasonable rates of the business subject to regulation under the Natural Gas Act and also for the purpose of determining the proper disposition of any rate reduction which we may order."

The Commission took the same position in *Re Cities Service Gas Co.*, 50 P.U.R. (N.S.) 65, 89.

(a) The decisions of this Court require a separation of property, which the Commission admitted it did not make, and the approval of its action by the Circuit Court of Appeals was erroneous.

The Commission itself admitted that it made no separation of property. It said:

> "The Commission is aware that in an investigation such as this it is incumbent on it to determine the reasonableness or unreasonableness of the rates and charges subject to its jurisdiction. * * *.
>
> "It does not follow, from this obligation of the Commission, that an allocation of physical property or portions thereon, must be made, before any excessive returns are determined, as seems to be the contention of the companies. * * *."
>
> (R. V. 1, pp. 174, 175.)

The Commission treated the properties of Petitioner and Canadian as a composite system.

As pointed out in the Statement of the Case contained in the petition, gas is produced by Canadian in the Panhandle Field of Texas, and it transports and sells off of its main line gas in intrastate commerce in Texas. The gas transported in interstate commerce to Colorado is of two classes: (1) gas transported as far as Pueblo, Colorado, and sold directly to industrial consumers, and (2) gas transported and sold for resale to distributing companies; one in the Arkansas Valley, one at Pueblo, one at Colorado Springs and one at Denver. Some of the "composite system" facilities are used in part for the transportation and sale of (1) intrastate sales in Texas; (2) interstate sales for resale, and (3) interstate direct sales. Other facilities are used exclusively for direct sale gas and for resale gas. This being the case, it necessarily follows from a simple application of common sense that a separation of the property, based upon the use which is made of it, is necessary in order to determine the reasonable rates for the sale of gas for resale in interstate commerce, which is the extent and limit of the Commission's jurisdiction. Such necessity is a matter of jurisdictional limitation imposed both by the Constitution and the statute. It was incumbent upon the Commission, in order not to transcend its jurisdiction, to draw and observe two jurisdictional boundaries: First, the boundary line between intrastate and interstate commerce, and, second, the boundary between sales for resale and direct sales. The Commission is circumscribed by each of these boundaries, and so it has been expressly held by this Court. In *Smith v. Illinois Bell Telephone Co.*, 282 U. S. 133, where intrastate rates were involved in a state commission order, and where some of the property was used in common for intrastate and interstate business, this Court said (pp. 147, 149):

> "At the threshold of the discussion, we are met with the fact that, in these findings, the commission and the court made no distinction between the intrastate and the interstate property and business of the company. It appears that the property of the company in Chicago is used to render (1) what is called exchange service, all of which is intrastate, (2) intra-

state toll service over its own lines and under arrangements with companies other than the American Company, and (3) interstate toll service, which includes all the toll service rendered under arrangements with the American Company. The company introduced evidence separating the intrastate and interstate business and also the intrastate exchange business. While the court regarded these computations as correct, and approved the method in which they had been made, still the court made no specific findings based on a separation of the intrastate and interstate property, revenues and expenses, but determined the issue on the basis of the total Chicago property of the company.

* * * * *

"The separation of the intrastate and interstate property, revenues and expenses of the company is important not simply as a theoretical allocation to two branches of the business. It is essential to the appropriate recognition of the competent governmental authority in each field of regulation. * * * The proper regulation of rates can be had only by maintaining the limits of state and federal jurisdiction, and this can not be accomplished unless there are findings of fact underlying the conclusions reached with respect to the exercise of each authority. In view of the questions presented in this case, *the validity of the order of the state commission can be suitably tested only by an appropriate determination of the value of the property employed in the intrastate business* and of the compensation receivable for the intrastate service under the rates prescribed. * * * As to the value of that property, and as to the revenue and expenses incident to that business, *separately considered;* there should be specific findings. Railroad Commission v. Maxcy, 281 U. S. 82, 83, 74 L. Ed. 717, 718, 50 S. Ct. 228." (Emphasis supplied)

The same rule was announced in the *Minnesota Rate Cases,* 230 U. S. 352, 435, 57 L. Ed. 1151, 1556, in the following language:

"Where the business of the carrier is both inter-

state and intrastate, the question whether a scheme of maximum rates fixed by the state for intrastate transportation affords a fair return *must be determined by considering separately the value of the property employed in the intrastate business* and the compensation allowed in that business under the rates prescribed. This was also ruled in the Smyth Case (id. p. 541). The reason, as there stated, is that the state cannot justify unreasonably low rates for domestic transportation, considered alone, upon the ground that the carrier is earning large profits on its interstate business, and, on the other hand, the carrier cannot justify unreasonably high rates on domestic business because only in that way is it able to meet losses on its interstate business." (Emphasis supplied)

This opinion also most emphatically rejects the notion that this required separation of property or separation of capital items can be substituted for by any formula based merely on revenue and expenses, or cost accounting, or particularly, as in that case, revenue; a thing akin to what the Commission attempted to employ in this case. The fallacy of this attempted substitute, of course, lies in the fact that such a process involves circuitous and inconclusive reasoning or argument, or is just another illustration of the dog chasing his tail. The Supreme Court in this Minnesota Rate Case continued by saying with respect to this method:

"When rates are in controversy, it would seem to be necessary to find a *basis for a division of the total value of the property* independently of revenue, and this must be found in the use that is made of the property. That is, there should be assigned to each business that *proportion of the total value of the property* which will correspond to the extent of its employment in that business. * * *." (Emphasis supplied)

Wabash Valley Electric Company v. Ralph M. Young, et al., 287 U. S. 488, 493, 77 L. Ed. 447, 451.

Accordingly, we have here as a ground for invoking this Court by certiorari, that the decision of the Circuit Court of Appeals approving what the Commission did, and sustaining its order based thereon, is probably in conflict with applicable decisions of this Court.

Incidentally, neither the Commission nor the Court in adopting this "allocation of cost of service" as a substitute for the separation or allocation of property, undertook to distinguish the decisions of this Court above cited, nor did either cite a single authority in support of the position taken.

(b) Even if the Commission's "allocation of cost of service" is a valid substitute for the separation of the property itself and could be approved, which we deny, no end result formula, such as approved in the Hope Case, can possibly cloak the flagrant errors in its application to our case.

The Commission's testimony respecting its so-called "allocation of cost" will be found in Volume 4 of the Record at pages 2215-2259, 2317-2399, and in Volume 5 at pages 2400-2448.

The method used by the Commission's witness has been explained in the Statement in the petition, pages 11 to 15. Such method clearly results in unfairly and arbitrarily assessing costs against non-regulable gas which should be borne by regulable gas.

To approve the result arrived at by such method completely ignores the restriction against fixing rates for sales of gas to industrial customers for consumption.

He admitted that in determining his "capacity cost", a component of his total transmission cost, he ignored peak load demands for domestic gas that would occur on the coldest expected days in Denver (for which the plant was designed), and that he arbitrarily took the deliveries

of regulated and unregulated gas as they happened to occur on February 9, 1939, which he called the "system peak day" for that particular year. The costs so determined he finally compared with the revenue derived from each of petitioner's customers.

It does not take any argument to show that there is something wrong about charging to the intrastate deliveries at Dalhart, Texas, a distance of 45 miles from the end of the gathering system, the same volumetric cost as is charged at Denver, a distance of 340 miles from such point. Neither does it take any argument to show that when the line from Pueblo to Denver is thrown into a common pot, the cost exclusively attributable to that line immediately becomes, in large part, attributed to the Colorado Fuel and Iron Company at Pueblo and other direct sale customers, and in part attributed to intrastate customers in Texas. This method decreases the cost which should be charged against the resale gas in Colorado, and makes it appear that the company is earning from its resale customers in Colorado more than it really is. It frees the resale gas from its proper share of the costs and thus burdens the direct sale gas.

No reasonable rate can be determined on the basis of an allocation of the cost of service, even if that be a valid substitute for the separation or allocation of the property itself, when priority of service as between resale domestic and direct sale industrial gas is ignored, when the system was designed and built to take care of the domestic customers on the coldest day to be expected, and when each of the contracts for direct sales expressly provided that the supply of gas might be interrupted at any time in order to take care of the domestic demand, and when, as the evidence shows, there had been many interruptions of the direct sale gas over a 10-year period of petitioner's experience.

The Company's evidence on the allocation of its property as between the direct sale gas and the resale gas is found in the record as follows: R. V. 2, pp. 1108-1118; V. 4, pp. 2264-2307. All of this testimony was completely disregarded by the Commission. (R. V. 1, p. 175.) The Court

passed over the point by stating as follows: "It may be conceded, without deciding, that the method is not free from defects or imperfections in all its aspects. But even so it cannot be said that as the consequence the impact of the orders of reduction, each in its totality, produces arbitrary results or oversteps the bounds of due process." (R. V. 8, p. 5088.) The action of the Court has resulted in no judicial inquiry into the action of the Commission in overstepping its statutory jurisdiction. Unless that inquiry is made, there is no manner in which the Commission can be held within the ambit of its statutory authority.

In addition to our contention above stated, that as a matter of jurisdictional necessity there should have been a separation or allocation of the property, and that the order of the Commission in this connection as approved by the Circuit Court of Appeals is probably in conflict with the decisions of this Court above cited, we have also, in connection with this point, the proposition that here is an important Federal question which has not yet been, but should be, settled by this Court. There have been several investigations and orders under the Natural Gas Act. At least one other case is now pending in the Circuit Court of Appeals in this Circuit. One has recently been decided in the Eighth Circuit, entitled *Panhandle Eastern Pipeline Co., et al., v. Federal Power Commission.* The opinion was handed down June 6, 1944, (not yet officially reported, but may be found in 54 P.U.R. (N.S.) 26) and we are advised that petition for certiorari has been or will be filed in this Court in due course. In that case, the Commission made no allocation of any kind as between "resale gas" and "direct sale gas" saying that it was not necessary because the direct sale gas was inconsequential. The Court affirmed, but there was a dissenting opinion by Circuit Judge Riddick, saying: "Here the Commission has admittedly refused to observe the limit upon its jurisdiction fixed by Congress."

The only two rate cases under the Natural Gas Act heretofore before this Court, the *Natural Gas Pipeline Case* and the *Hope Case, supra,* did not involve this question of allocation at all. Undoubtedly there will be other cases under the Natural Gas Act before the Federal Power Com-

mission involving this principle of allocation, and it is important that this novel allocation of costs of service should be explored and the question properly decided for future guidance. Not to have this question properly decided will permit the Federal Power Commission indirectly to draw to itself full control over the rates of gas sold to direct industrial customers in competition with other fuels, and permit siphoning off profits from direct sale gas to the credit of resale gas. If this is permitted, then any limitation imposed by Congress becomes a farcical and useless endeavor. The Court, in merely stating what the Commission had to say on this subject of allocation, and then approving it, notwithstanding the decisions of this Court above cited and notwithstanding the gross and flagrant errors in the application of the Commission's substitute method, has, in effect, denied to petitioner its right of judicial review expressly conferred by the Natural Gas Act, giving rise to the third reason stated in the petition why the writ of certiorari should be granted.

For the foregoing reasons it is respectfully submitted that the petition for writ of certiorari should be granted.

Respectfully submitted,

APPENDIX A.

The pertinent provisions of the Natural Gas Act of 1938 (52 Stat. 821, et seq.; Title 15, U.S.C.A., Sec. 717) are as follows:

Sec 1 (b). "The provisions of this Act shall apply to the transportation of natural gas in interstate commerce, to the sale in interstate commerce of natural gas for resale for ultimate public consumption for domestic, commercial, industrial, or any other use, and to natural-gas companies engaged in such transportation or sale, but shall not apply to any other transportation or sale of natural gas or to the local distribution of natural gas or to the facilities used for such distribution or to the production or gathering of natural gas."

Section 4 (a). "All rates and charges made, demanded, or received by any natural-gas company for or in connection with the transportation or sale of natural gas subject to the jurisdiction of the Commission, and all rules and regulations affecting or pertaining to such rates or charges, shall be just and reasonable, and any such rate or charge that is not just and reasonable is hereby declared to be unlawful.

(b). "No natural-gas company shall, with respect to any transportation or sale of natural gas subject to the jurisdiction of the Commission, (1) make or grant any undue preference or advantage to any person or subject any person to any undue prejudice or disadvantage, or (2) maintain any unreasonable difference in rates, charges, service, facilities, or in any other respect, either as between localities or as between classes of service.

(c). "Under such rules and regulations as the Commission may prescribe, every natural-gas company shall file with the Commission, within such time (not less than sixty days from the date this Act takes effect) and in such form as the Commission may designate, and shall keep open in convenient form and place for public inspection, schedules showing all rates and charges for any transportation or sale subject to the jurisdiction of the Commission, and the classifications, practices, and regulations affecting such rates and

charges, together with all contracts which in any manner affect or relate to such rates, charges, classifications, and services."

Section 5 (a). "Whenever the Commission, after a hearing had upon its own motion or upon complaint of any State, municipality, State commission, or gas distributing company, shall find that any rate, charge, or classification demanded, observed, charged, or collected by any natural-gas company in connection with any transportation or sale of natural gas, subject to the jurisdiction of the Commission, or that any rule, regulation, practice, or contract affecting such rate, charge, or classification is unjust, unreasonable, unduly discriminatory, or preferential, the Commission shall determine the just and reasonable rate, charge, classification, rule, regulation, practice, or contract to be thereafter observed and in force, and shall fix the same by order: *Provided, however*, That the Commission shall have no power to order any increase in any rate contained in the currently effective schedule of such natural gas company on file with the Commission, unless such increase is in accordance with a new schedule filed by such natural gas company; but the Commission may order a decrease where existing rates are unjust, unduly discriminatory, preferential, otherwise unlawful, or are not the lowest reasonable rates."

Section 6 (a). "The Commission may investigate and ascertain the actual legitimate cost of the property of every natural-gas company, the depreciation therein, and, when found necessary for rate-making purposes, other facts which bear on the determination of such cost or depreciation and the fair value of such property."

Section 19 (b). "Any party to a proceeding under this Act aggrieved by an order issued by the Commission in such proceeding may obtain a review of such order in the circuit court of appeals of the United States for any circuit wherein the natural-gas company to which the order relates is located or has its principal place of business, or in the United States Court of Appeals for the District of Columbia, by filing in such court, within sixty days after the order of the Commission upon the application for rehearing, a written petition praying that the order of the Commission be

modified or set aside in whole or in part. A copy of such petition shall forthwith be served upon any member of the Commission and thereupon the Commission shall certify and file with the court a transcript of the record upon which the order complained of was entered. Upon the filing of such transcript such court shall have exclusive jurisdiction to affirm, modify, or set aside such order in whole or in part. No objection to the order of the Commission shall be considered by the court unless such objection shall have been urged before the Commission in the application for rehearing unless there is reasonable ground for failure so to do. The finding of the Commission as to the facts, if supported by substantial evidence, shall be conclusive. If any party shall apply to the court for leave to adduce additional evidence, and shall show to the satisfaction of the court that such additional evidence is material and that there were reasonable grounds for failure to adduce such evidence in the proceedings before the Commission, the court may order such additional evidence to be taken before the Commission and to be adduced upon the hearing in such manner and upon such terms and conditions as to the court may seem proper. The Commission may modify its findings as to the facts by reason of the additional evidence so taken, and it shall file with the court such modified or new findings, which if supported by substantial evidence, shall be conclusive, and its recommendation, if any, for the modification or setting aside of the original order. The judgment and decree of the court, affirming, modifying, or setting aside, in whole or in part, any such order of the Commission, shall be final, subject to review by the Supreme Court of the United States upon certiorari or certification as provided in sections 239 and 240 of the Judicial Code, as amended (U.S.C., title 28, secs. 346 and 347)."

ON PETITIONS FOR WRITS OF CERTIORARI TO THE UNITED STATES CIRCUIT COURT OF APPEALS FOR THE TENTH CIRCUIT

REPLY BRIEF OF COLORADO INTERSTATE GAS COMPANY AND CANADIAN RIVER GAS COMPANY, PETITIONERS, IN SUPPORT OF PETITIONS FOR WRITS OF CERTIORARI

The belated brief filed by the Respondents in opposition to the petitions of Colorado Interstate Gas Company and Canadian River Gas Company for writs of certiorari in their respective cases is apparently tendered and filed as a common brief for both cases, although as far as Petitioners have been informed, no order of consolidation has been entered. Following, however, the procedure of the Respondents, Petitioners will join and make this one reply to the common brief of the Respondents captioned in the two cases.

In this reply we shall use the same abbreviations used in the petitions for the writs and the briefs filed in support thereof.

Colorado Interstate's petition for writ sets forth and presents four separate and independent questions. Canadian's petition for writ sets forth and presents nine separate and independent questions.

Respondents in their brief state to this Court that there are only four questions presented in these two applications for writs, which they set forth in their brief. We respectfully submit that there are thirteen separate and independent questions presented by the two petitions, and these are the thirteen questions set forth in the two petitions, and Respondents cannot dispose of the questions presented by the petitions by ignoring them or indicating, as they have, that such questions are not before this Court.

This reply brief is rendered necessary only because the Respondents have thought it proper either to entirely ignore or avoid the questions presented by Petitioners, or, where they have purported to answer any of our questions, they have, in many instances, based their answer upon inaccurate or misleading references to the record.

We will not in this reply re-argue our questions presented, but will limit the reply to calling the Court's attention to the points which have been ignored and avoided by counsel for the Respondents and to the portion of counsel's argument which is based upon the inaccurate and misleading references to the record.

Exercise of Prohibited Rate Regulatory Jurisdiction Over Production and Gathering

This is Question No. 1 presented by Canadian in its petition (page 3), with the reasons in support thereof set forth at pages 27, et seq. It is entirely ignored and avoided by the Respondents; it is not listed in Respondent's brief as being among the "questions presented." The Congress of the United States, in Section 1(b) of the Act, has expressly provided that the Commission should not have jurisdiction over production or gathering. In the Hope case this Court said, not once, but twice, that the Commission has no jurisdiction over production and gathering. (Pages 287,

289, Vol. 88, L. Ed., Advance Opinion.) The Circuit Court in its opinion in this case expressly holds that the Commission does not have rate regulatory jurisdiction over production and gathering. (R., V. 8, 5075) The law of this case is, therefore, that the Commission does not have jurisdiction over production and gathering. The Respondents have not applied for any writ directed to the holding of the Circuit Court that the Commission does not have such jurisdiction, and, of course, are bound by the law of the case as established by the Circuit Court. The question presented by Canadian's Question No. 1 is not whether the Commission has jurisdiction over production and gathering because the law of the case is that it has not, but the question is whether what the Commission did, and which the Circuit Court approved, does not constitute an exercise of jurisdiction over production and gathering, which the Act, the Circuit Court, and this Court have held is prohibited. This question is absolutely ignored and avoided in Respondents' brief. For reasons pointed out in Canadian's petition, the question is of such great importance as to justify the granting of the writ directed thereto. We do find a short footnote at pages 18 and 19 of Respondents' brief, possibly intended to be a passing casual recognition that this point is included in the case, although obviously the footnote has no bearing upon the text to which it is a footnote. In this footnote the Respondents contend that if the Commission does not have jurisdiction over production and gathering, it could not fix reasonable rates for interstate transportation and sales, as required by the Act. Support is sought to be found for this statement in the opinion of this Court in the Hope case. Clearly no such support can be found in that case. Where this Court discussed production and gathering in the Hope case, it stated, not once but twice, that the Commission did not have jurisdiction over production and gathering. No question of such jurisdiction was raised by the Hope Company, such as raised in this case, and the discussion there had was with reference only to the position taken by the State of West Virginia and clearly has no bearing at all upon the question here presented.

Moreover, as we have pointed out in the reasons in support of this point, it is not impossible for the Commission to exercise its delegated jurisdiction over interstate trans-

portation and sales without exercising a prohibited jurisdiction over production and gathering. The evidence established a commodity value of Canadian's gas at the wellhead in the field and at its gathering system termini. The Commission could have used this commodity value of Canadian's gas as the starting point for the exercise of its delegated jurisdiction over interstate transportation and sale and avoided any usurpation of prohibited jurisdiction over production and gathering.

The Commission held that it does have jurisdiction over production and gathering. The Circuit Court ruled that it does not, but further held that what the Commission did does not constitute an exercise of jurisdiction over production and gathering. The Respondents make no attempt here to support the Circuit Court in the Court's ruling that what the Commission has done does not constitute regulation of production and gathering. The Respondents still insist, however, (without having applied for any writ to reverse the Circuit Court), that the Commission does have jurisdiction over production and gathering.

We submit the determination of the question presented, so completely ignored and avoided by Respondents, should be assumed by this Court.

Valuation of Canadian's Leasehold Properties

In Question No. 2 presented by Canadian it is pointed out that, even assuming arguendo that the Commission has rate regulatory jurisdiction over production and gathering, it is improper in determining a production and gathering rate base, to limit the value of gas leaseholds to their original cost of acquisition, generally speaking on a "wildcat" value basis while in the hands of predecessor companies to the exclusion of all discovery, market or other values. The result of such procedure adopted by the Commission is to limit Canadian's return, as far as its gas leaseholds are concerned, generally to 6½% per annum, on a nominal value and, in many instances, on a zero value, as some of Canadian's now most valuable leases were acquired without cash consideration, and in consideration of drilling obligation only. Canadian contends (even assuming rate regulatory jurisdiction) that original cost is not the proper basis

for the inclusion of gas producing leaseholds in a rate base, and that the Commission has erred in blindly following its original cost and prudent investment theories with respect to Canadian's gas leaseholds and in wholly disregarding uncontroverted evidence of value.

Respondents, in their brief, have absolutely ignored and entirely avoided this question. They do not even make a casual reference to its existence as one of the questions presented. We submit that Respondents' silence recognizes the merit to this question.

Abrogation of the Cost Reimbursement Provisions of the Cost Contract

The error in the Commission's action in abrogating the cost reimbursement provisions of Canadian's cost contract is presented in Question No. 4 in Canadian's petition, with reasons in support thereof set forth on pages 19 and 20. This again is ignored in Respondents' statement of questions proposed to be presented, although on page 20 of their brief they ask this Court to affirm the death penalty against Canadian in reliance upon Chicago B. & Q. R. R. Co. v. Iowa, 94 U. S. 155, 162-163. This case, we submit, is entirely inapplicable, and, if it could be construed as supporting Respondents' contention and thus requiring Canadian to do the impossible (as Respondents' brief impliedly admits), it is certainly contrary to and inconsistent with the "rate impact" and "end result" principles announced by this Court in the Hope case.

Original Cost of Properties

This question is discussed in Canadian's petition (pages 8-10, 17-19, 31-33) and in Colorado Interstate's petition. (Pages 6-9, 17-21.)

Respondents, in their answer brief, (pages 10-14) attempt to answer Canadian's contentions on the theory that the transaction whereby Canadian acquired certain properties from Amarillo Oil Company was between affiliates and, as a matter of fact, constituted no sale at all. This argument is fallacious. The record clearly shows there was a sale which resulted from prolonged, arm's-length bargaining between

non-affiliated companies and that Five Million Dollars in cash was paid for such properties.

The purchase of the wells, gas rights, and leaseholds from Amarillo Oil Company was a condition precedent to the launching of the enterprise. It did not constitute, in any sense, a pooling of assets as suggested by Respondents. The money, when paid, belonged to Amarillo Oil Company to use as it desired without let or hindrance so far as the other parties were concerned. The project might have failed completely, but even so, Amarillo Oil Company would have retained as its own, the full Five Million Dollars received for the property it sold. This being true, neither the case of Niagara Falls Power Co. v. Federal Power Commission, 137 F.2d, 787, nor the other cases cited by the Respondents have any bearing whatsoever upon the question submitted.

Respondents also intimate (pages 12-13) that Amarillo Oil Company received only $310,000.00 of the purchase price. This statement is erroneous. Commission staff witness Luttring testified unequivocally as follows:

> "Ultimately the Amarillo Oil Company received by way of credits, or otherwise, the full amount of the purchase price of Five Million Dollars." (R., V. 5, p. 2938).

He also stated that the bulk of the Five Million Dollars was distributed by Amarillo Oil Company to Southwestern as a dividend. (R., V. 5, 2938)

The fact that Canadian carried the alleged profit made by Amarillo Oil Company on its books as "Appreciation" and that no income taxes were paid at that time has no significance whatsoever. Certainly this method of handling the matter does not change the actual *fact* as reflected by the uncontradicted evidence in this Record. Southwestern filed a consolidated income tax return for the period covered by the sale, which return reflected all of the operations of all of its subsidiaries, including Amarillo Oil Company and Canadian. (R., V. 5, 2638, 2639, 2905, 2906). This necessarily resulted in the elimination of any profit as well as any loss from an income tax standpoint, but it also resulted in a lower depreciation base for Canadian, and, in the long run, will probably result in the payment of more income taxes rather than less.

The "Appreciation" so called was carried on the books of Canadian purely for income tax purposes and merely as a matter of bookkeeping convenience. Its only purpose was to show the correct depreciation base that resulted from the consolidated income tax return. It was not a writeup, as intimated by Respondents, in any sense of the word. It resulted in no entry whatsoever in the surplus account. (R., V. 5, 2637) Had it been a writeup, it necessarily would have been reflected in that account.

The primary reason and perhaps the only reason that Commission staff and Commission ignored this arm's length sale was the fact that an alleged profit was made by Amarillo Oil Company and the further fact that the Commission considered the transaction as a purchase and sale between affiliated companies. (R., V. 8, 2908)

If we should assume, for the purpose of the argument, that the transaction did constitute a sale between affiliated companies, even this would not justify the action taken by the Commission and its staff. This very principle has been decided by the Supreme Court in the case of American Telephone and Telegraph Company vs. United States, 299 U. S. 232, 240; 81 L. Ed. 142. Mr. Justice Cardozo, speaking for a unanimous court, held definitely and positively that even where properties were purchased from an affiliated company, that if the difference between the purchase price and the cost to the selling company represented *a true increment of value*, such profit could not be written off or ignored. This rule has been followed and applied in the recent case of New York Telephone Company v. United States of America, et al., decided by a three judge court, Southern District of New York on August 24, 1944. (This case not yet reported.)

There is not the slightest intimation in the Record in this case that the properties purchased by Canadian were not worth every dime paid for them. In fact, the Record clearly shows that the property was worth far more than the purchase price paid.

We shall not here re-argue Colorado Interstate's contention that the Commission and the Court erred in eliminating from original cost or prudent investment the cost of certain

contracts. The respondents merely answer this contention by asserting that they were transactions between affiliates, which is entirely incorrect, and Colorado Interstate's petition and brief show conclusively that this was an arm's length transaction between companies, neither of which had any interest in the other.

Life of Canadian's Reserves

This question was discussed in Canadian's petition, pages 6, 7, 20-22, 36-38.

The respondents, in their answer, pages 14-16, contend that there was an issue of fact as to the life of Canadian's reserves, and further, that it doesn't make any difference anyway whether such reserves last fifty-three years or twenty-seven years or any other period.

Respondents cite testimony of Commission Witness Hammer to the effect that such reserves had a life of 73.7 years. This reference is misleading. Respondents did not refer to all of the testimony of such witness. The witness made it very clear on cross examination that this figure (73.7 years) "was used only in an illustrative manner and it was not his conclusion as to the life of Canadian's reserves." He testified further that he had arrived at no definite conclusion with respect to the life of such reserves, and had merely attempted to arrive "at a reserve beneath the Canadian River acreage * * * as of August 1, 1939." And whether Canadian would recover the entire amount of reserves as estimated "is a question that isn't * * * directly associated with an estimate of reserves." (R., V. 7, 3999) This testimony completely and directly refutes Respondents' contention.

It is true that the Commission stated in its opinion that theoretically, migration of gas is automatically accounted for under the "pressure decline method" and is actually accounted for if the isobaric maps are properly drawn. It is perfectly apparent from the Commission's opinion that it was referring, in this connection, to the *estimate of reserves* made by Commission staff. (R., V. 1, 158-159) This finding, therefore, has no relevancy whatsoever with respect to the *life* of Canadian's reserves. The Record clearly shows, without contradiction, that the life of a portion of an intercon-

nected reservoir where drainage exists, cannot be determined by estimating the reserves under the portion in question, and then dividing this by the estimated future annual production from that portion only. Even if there were any evidence in the Record that the *life* of such reserves could be determined in such manner, and there is not, such evidence would be so completely contrary to fundamental natural laws that no court or commission could logically accept such testimony.

What the Commission witness did say was that *he had made no study of drainage at all*, and that his isobaric map took into consideration only *certain drainage factors* and that "it does not adjust itself completely to the drainage question." (R., V. 6, 3641) *The witness was also speaking of his reserve estimate only, and not with respect to the life of Canadian's reserves.*

We state unequivocally that there is not a single line of testimony in this record that would support a finding that the life of Canadian's reserves can be determined in the manner in which the Commission attempted to determine such life. On the other hand the Record positively, affirmatively, and without contradiction, establishes the fact that such life cannot be determined by the method followed by the Commission. If we resolve all disputed questions of fact with respect to the life of Canadian's reserves in favor of the Commission's determination, such life does not exceed twenty-seven years from December 31, 1939.[1]

The Respondents, however, take the position that the Circuit Court has found that the Record does not disclose that the Commission failed appropriately to weigh the "existing volume, pressure differentials and consequent drainage and other recovery factors." We again direct the attention of the court to the fact that the Circuit Court there was speaking

---

[1] This Court, in the case of Thompson, et al. v. Consolidated Gas Utilities Corporation, et al., 300 U.S. 55, 71; 81 L. Ed. 510, 519, recognizes the drainage situation existing in the Texas Panhandle Field and that gas in such field migrates or drains throughout the field from areas of high pressure to areas of low pressure. There is nothing in this Record that would, in any manner, cause this Court to make a different finding as to drainage at this time.

only of reserve estimates and was not referring in any sense of the word to the life of such reserves. (R., V. 8, 5091)

Moreover, the very fact that the Commission determined Canadian's recoverable reserves to be 2,800,000,000 Mcf, and then determined the life thereof simply by dividing into this figure, an estimated future annual production of fifty-five million Mcf., shows conclusively upon its face that the Commission did not take drainage into account, but necessarily assumed that Canadian would produce every cubic foot of recoverable reserves under its acreage. (R., V. 1, 159)

The Respondents then say, (Pages 15-16) referring to the Commission's opinion that it makes little difference whether the life of Canadian's reserves was properly determined or not if consistency is maintained in computing the annual expenses and the accrued depreciation and depletion. We submit that it does make a difference even though the Commission's theory of "consistency" is followed and that this difference amounts, so far as both Canadian and Colorado Interstate are concerned, to a very substantial sum per year for each company in net earnings.

Canadian's Revenues Available for Return

This question was discussed in Canadian's petition, Pages 22-24, 38.

The Respondents, in their answer, Footnote, Page 21, state, contrary to Canadian's contention, that Commission's Accountant did actually restate Canadian's revenues as well as its expenses on an accrual basis for the test year. This statement is very misleading. The Accountant did restate Canadian's income on an accrual basis *in some particulars*. He did not adjust Canadian's income with respect to that portion of rate case expense and income taxes actually paid in cash in 1939, but allocated to other years on an accrual basis.

The adjustments made in income are clearly reflected in Exhibit 168. (R., V. 6, 3419, 3421) It will be noted that three items only were included in this adjustment, two of them being debits and one a credit; but none of such adjustments included the items here in question. This resulted

in a net deduction of income in the sum of $54,708.28. The total income as shown by Canadian's books was $2,448,095.27. (R., V. 6, 3415) This income, as adjusted by the Commission Accountant, was $2,393,386.99, (R., V. 6; 3417), or a total deduction of exactly $54,708.28. It will be noted also that the Commission, in its opinion, found Canadian's income as adjusted to be $2,393,387.00 (R., V. 1, 171) being the exact amount determined by the Commission's Accountant. It is perfectly apparent, therefore, that neither the Commission nor its Accountant made any adjustments whatsoever in the income account by reason of the elimination of the items complained of in the expenses for the year 1939. The court will bear in mind that under the "Cost Contract," income always balanced precisely with cash expenditures and, therefore, both income accounts and expense accounts were necessarily kept on a cash basis. Assuming the Commission was correct in eliminating some of the cash expense items, then it became absolutely necessary to make the same adjustments in income for the reason that the income was determined absolutely by the expenses and had such expenses not been incurred in that year, the income would have been less by that precise amount.

Respondents also contend that rates were not affected by reason of the Commission's treatment of the $15,056.24 adjustment made by reason of the alleged profits of Amarillo Oil Company in the extraction of gasoline. This is also a misleading statement. The record shows clearly that the Commission Accountant credited the production expense of Canadian with the amount of the alleged profit made by Amarillo Oil Company and thus reduced Canadian's production expenses in 1939 by this exact amount. This necessarily resulted in increasing Canadian's revenues available for return in this same amount. (R., V. 6, 3425, 3461, 3462, 3466, 3472) Respondents strangely refer to the allocation study made by a Commission witness. (R., V. 4, 2317, 2382) This witness merely deducted the amount of Amarillo Oil Company's alleged profit from the cost of gas it had purchased from Canadian, and thus showed a smaller figure for gas purchased. This allocation study, by the wildest stretch of the imagination, can have absolutely no relevancy to the question here presented. It dealt with an entirely different

subject and its only purpose was to develop a formula with respect to the allocation of cost as between regulated and nonregulated business. The fact that the Commission did actually reduce Canadian's operating expenses by the amount of this alleged profit, did result in the regulation by it of Amarillo Oil Company's purely intrastate transactions over which the Commission had no jurisdiction and which had absolutely no relationship to Canadian's operations.

Respondents also contend that the question with respect to Texas gross production taxes paid by Canadian was raised for the first time in the Circuit Court. This question was raised in the Motion for Rehearing filed with the Commission.[2] (R., V. 1, 265) Respondents' statement that an excessive allowance for income taxes would more than offset this has no relevancy whatsoever. It is absurd to say that Canadian would have no taxable income if, as a matter of fact, it will have a net income in excess of $600,000. (R., V. 1, 173)

Depreciation as an Annual Operating Expense

This question was discussed in Canadian's petition, pages 24, 25, 38-40.

Respondents on page 16 of their answer brief, make the contention that Canadian is seeking to place in the rate base, and amortize, future replacements, and they say that this was condemned by this Court in the Natural Gas Pipe Line Case. We make no such contention.

We simply contend that the Commission's testimony reflects clearly and without question that it will be necessary for Canadian to make replacements of property now in use at a cost of $6,500,000 during the service life of the enterprise as determined by the Commission.

Colorado Interstate's contention with respect to the allowance for annual depreciation and amortization not being sufficient to take care of interim replacements that will have

---

[2]The footnote on page 24 of Canadian's petition states that the Act of the Texas Legislature which increased gross production taxes became effective May 1, 1944. This was a typographical error. The Act became effective May 1, 1941.

to be made, fully presented in its petition and brief, has been ignored and avoided by Respondents, and accordingly we do not undertake to re-argue this matter here.

An unbroken line of authorities which have been approved in principle by this Court hold that in a limited life project such as this one, the company must accrue over the life of the project (1) a fund sufficient to enable it to replace physical properties that will be worn out prior to the termination of the project, and in addition thereto (2) a fund sufficient to return to it the value of its properties upon the termination of the project.

The depreciation and depletion allowances made by the Commission are wholly inadequate to accomplish this. Such allowances should be increased sufficiently to enable Canadian and Colorado Interstate to make these necessary replacements.[3]

Allocation

The Respondents make no answer to our contentions in this respect. They impliedly concede, and the Record clearly shows, that they considered both Canadian and Colorado Interstate as one composite system in the development of the allocation formula. This being true, there was no basis to make any reduction whatsoever in the price of that portion of the gas sold by Canadian to Colorado Interstate for direct pipe line industrial sale.

We might also add that Section 1 (b) of the Natural Gas Act must necessarily be read in connection with Section

---

[3]The opinion in the Natural Gas Pipe Line Case (315 U.S. 575) does not condemn Canadian's contentions with respect to this issue. The Court stated on page 592 that an item for future capital additions through 1954, *including replacements* amounting to $12,159,380 was included in the amortization base. Footnote 9 on the same page discloses that of this amount, $9,146,683 constituted the cost of additional properties or future capital additions. It is apparent, therefore, that the cost of replacements totaled approximately three million dollars. The cost of these replacements was actually included in the amortization base and this action was not condemned by the Court. We are not here asking that replacements be placed in the rate base or, in any sense, amortized. We merely say that the Commission committed error in failing to allow sufficient annual depreciation and amortization allowances, considering only the property presently in service, to enable Canadian and Colorado Interstate to make such necessary replacements. As a matter of fact, the opinion in the Natural Gas Pipe Line Case may be cited to support our contention.

1 (a) of the Act which empowers the Commission to regulate gas sales that are made for ultimate distribution to the public and not otherwise. Clearly the sales of gas to direct pipe line and industrial consumers is not governed by the terms of the Act.

In Colorado Interstate's petition and brief decisions of this Court are cited to the proposition that in a case of this kind there must be an allocation of property, which the Commission admittedly did not make. These cases are disposed of by the assertion that they do not prevent the use of such a formula as the Commission adopted. We shall not attempt here to re-argue that question.

Also, in Colorado Interstate's petition and brief numerous glaring imperfections were pointed out in the application of the formula which the Commission did use. All of this, however, is utterly ignored and avoided by Respondents, and we shall not re-argue that matter here.

Financial History

On page 20 of the reply brief it is stated:

> "Nor does the financial history of the enterprise sustain the validity of a 'confiscation' argument on the part of Colorado and Canadian."

They then cite certain figures showing, with respect to Colorado Interstate, the dividends paid, the reserves accumulated for depreciation and amortization of contracts, surplus, and reduction of debt, up to December 31, 1939, and as to Canadian they show how much of its total cash investment had been recovered in cost of gas up to December 31, 1941. Respondents fail to advise the Court, however, that Canadian has never paid a dividend. The Commission has found that Canadian is entitled to a net return of $609,375 annually, which is at the rate of 6½% on the rate base found by the Commission. This sum of $609,375, multiplied by the 13½ years between the time of Canadian's organization and December 31, 1941, would total $8,226,562 of net return to which the Commission concedes Canadian was entitled, but which was not paid out by way of dividends, but

is reflected in the debt reduction commented upon by Respondents in their answer brief.

The obvious purpose of such a recitation was, of course, to persuade the Court to deny the petitions for certiorari, regardless of the many reasons assigned therefor, most of which are wholly unanswered and many of which are not so much as mentioned.

Among the reasons why the figures set forth have no bearing on the question of the legality of the Commission's order, and accordingly have no proper place in the brief, we will discuss only three:

1. These earnings of Colorado Interstate, and the alleged earnings of Canadian, are from their entire operations. No attempt has been made by counsel, nor has any attempt been made by any of the witnesses, to show what part of these earnings resulted from sales for resale, and what part thereof resulted from direct industrial sales over which the Commission has no jurisdiction whatsoever. As to Colorado Interstate, we invite the Commission's attention to the very large volume of direct industrial sales, as shown on the Commission's own flow map attached to Colorado Interstate's petition as an appendix. The evidence showed that Canadian also had received substantial revenue from direct sale industrial gas, and, in addition, that Canadian received substantial revenue from its intrastate sales in Texas, over which, of course, the Commission had no jurisdiction.

We submit that it is worthless to bring in figures of this kind from the total operations without attempting to advise the Court, as they could not, what portion of the total revenue was derived from sales for resale in interstate commerce, which is the limit of the Commission's jurisdiction.

2. The earnings so shown for Colorado Interstate and the alleged earnings of Canadian covered the period from the beginning of their operations in June, 1928, to December 31, 1939 for Colorado Interstate and to December 31, 1941 for Canadian. For ten years of these respective $11\frac{1}{2}$-year and $13\frac{1}{2}$-year periods neither Colorado Interstate nor Canadian was subject to regulation. Is the Commission to

be permitted, when in 1939 it launches upon a consideration of reasonable rates pursuant to the Natural Gas Act passed in June, 1938, to go back and take into consideration the earnings of the companies for the ten-year period when the companies were subject to no regulation whatsoever? We submit that the question answers itself. We submit also that consideration of such earnings for the ten-year period cannot properly be invoked as a cloak to cover other imperfections in the Commission's Findings and Order.

3. Even if the companies had been under regulation throughout the period of their operations, still their past earnings could no more be used to justify confiscatory rates for the future than past losses, (if they had had them), could be used to justify increased rates for the future; and so this Court has expressly held. In *Board of Public Utility Commrs. v. New York Teleph. Co.*, 271 U. S. 23, the Court in a unanimous opinion (Mr. Justice Stone not participating) on page 32 said:

> "* * * Past losses cannot be used to enhance the value of the property or to support a claim that rates for the future are confiscatory. (Citing cases from this and other courts.) And the law does not require the company to give up for the benefit of future subscribers any part of its accumulations from past operations. Profits of the past cannot be used to sustain confiscatory rates for the future. (Citing cases from this and other courts.)"

This doctrine, even then so well established, was reaffirmed in *Los Angeles G. & E. Corp. v. Railroad Comm.*, 289 U. S. 287. On page 313 the Court said:

> "* * * Deficits in the past do not afford a legal basis for invalidating rates otherwise compensatory any more than past profits can be used to sustain confiscatory rates for the future. Public Utility Comrs. v. New York Teleph. Co., 271 U. S. 23."

The "End Result" and "Rate Impact" Principles Announced in the Natural Gas Pipeline and Hope Cases

In Question No. 9 presented in Canadian's petition we have analyzed the "end result" or "rate impact" effect of the Commission's order on Canadian. Respondents, in their brief, in so far as they have attempted to make any answer to the questions presented, have directed their argument (with inaccurate and misleading references to the Record, as hereinabove pointed out) to certain specific matters selected by them, but they have again totally ignored and avoided the question presented as to whether the Commission's order can be sustained under the "end result" and "rate impact" principles announced by this Court in the Natural Gas Pipeline and Hope cases. On pages 40-42 in Canadian's petition we have sumarized our position as to why the order cannot be sustained under these principles so announced by this Court. We submit that the author of Respondents' brief was fully convinced as to the merit of our position, and, being unable to suggest an answer which could be justified, decided to ignore and avoid the point entirely. Canadian earnestly contends that the basic reasoning behind the "end result" and "rate impact" principles announced by this Court in the Natural Gas Pipeline and Hope cases requires the Commission's order as to Canadian to be set aside and the Circuit court's affirmance thereof reversed.

Other Points Presented

As we have pointed out, Canadian's petition contains nine questions presented and Colorado Interstate's petition contains four questions presented. Respondents' brief avoids some of the most important questions entirely, and bases its answer to other questions upon inaccurate and misleading references to the Record. It is not our intention here fully to present all of the reasons advanced by Colorado Interstate and Canadian in support of all of the questions presented, as this would be an unnecessary repetition of the reasons and arguments set forth in the petitions and briefs filed in support thereof. As to any question presented in either of the petitions which is not specifically referred to in this reply, it should, of course, be understood that we are not waiving any such questions, but we consider that our position is fully set

forth in the reasons and arguments advanced in connection with the petitions and that nothing is set forth in Respondents' brief with reference thereto requiring further argument or reply.

BRIEF OF PETITIONER.

OPINION BELOW.

The opinion of the Circuit Court of Appeals, Tenth Circuit, is reported in 142 Fed. (2d) 943.

GROUNDS UPON WHICH JURISDICTION OF THIS COURT IS INVOKED.

The jurisdiction of this Court is invoked under Section 19 (b) of the Natural Gas Act (52 Stat. 821; Title 15, U. S. C. A., Sec. 717r) and Section 240a of the Judicial Code as amended by the Act of February 13, 1925 (Title 28, U. S. C. A., Sec. 347). A copy of the sections of the Natural Gas

Act pertinent to this review is attached hereto as Appendix A. Certiorari was granted on November 13, 1944.

STATEMENT OF THE CASE.

1. The Case for Review.

This is a rate case involving an order of the Federal Power Commission (hereinafter referred to as the "Commission") under the Natural Gas Act, reducing the rates charged by petitioner, Colorado Interstate Gas Company (hereinafter sometimes called "Colorado Interstate"). In the same case the Commission entered similar orders reducing rates of Canadian River Gas Company (hereinafter sometimes called "Canadian") and Colorado-Wyoming Gas Company (hereinafter sometimes called "Colorado-Wyoming"), petitioners in Cases Nos. 380 and 575, respectively. The Circuit Court of Appeals affirmed the Commission's order in all respects.

The Court in granting certiorari, limited its review to Questions 5 and 6 stated in the Company's petition. These are:

> "5. Whether consistently with the requirements of the Fifth Amendment to the Constitution of the United States and the Natural Gas Act the Commission could determine reasonable rates for gas sold for resale in interstate commerce without making a separation or allocation of the property of Canadian and petitioner which, in this case, is used in making intrastate sales in Texas and interstate sale of both resale and direct sale gas, the Commission having no jurisdiction over intrastate sales or over direct sales in interstate commerce to industrial consumers.
>
> "6. Whether the Commission's substitute method of allocation of cost of service which results in burdening non-regulable gas with costs actually chargeable against regulable gas violates the Fifth Amendment to the Constitution of the United States and the Natural Gas Act."

2. THE PETITIONER'S OPERATIONS.

Canadian owns a natural gas producing property in the Panhandle Field in Texas. Of the gas produced by it, a part is sold in the producing field in intrastate commerce; a part is delivered in the field to the compressor stations of Texoma Natural Gas Company for eventual sale and delivery to the Natural Gas Pipeline Company of America, which extends to the Chicago area; and a part is transported through Canadian's pipe line, which extends 86 miles to a point near Clayton, New Mexico, where it connects with the pipe line of Colorado Interstate. Canadian sells gas from its pipe line to its intrastate customers in Texas, to the Clayton Gas Company in New Mexico and to Colorado Interstate at the point of connection of the two pipe lines.

Colorado Interstate transports such gas through its pipe line, which extends to Denver, and sells gas in part to various distributing companies in Colorado for resale by them. Gas is transported and sold near Denver to Colorado-Wyoming, which that company transports and sells at points in northern Colorado and at Cheyenne, Wyoming.

In addition to the gas so produced, gathered and transported for a distance by Canadian, and transported for a greater distance by Colorado Interstate, and sold by the last named company for resale, gas is also transported by means of the same facilities in part and sold directly to industrial customers in Colorado for their consumption. It is to be remembered that such direct sales to industrial customers, even though made in interstate commerce, are by the terms of the Natural Gas Act excluded from regulation. See Section 1 (b) of the Natural Gas Act contained in Appendix A hereto. A flow diagram map of the pipe line systems of Colorado Interstate, Canadian and Colorado-Wyoming showing the quantities of gas produced, gathered, transported and delivered to the several classes of customers, which was prepared and introduced by engineers of the Commission (R. V. 2, p. 1079), is hereto attached as Appendix B. From this flow diagram, and from the undisputed evidence more specifically referred to hereinafter, it is established that (1) gas transported solely in intrastate

commerce, and (2) gas transported in interstate commerce make common use of Canadian's pipe line. It is also established that of the gas transported by Canadian and Colorado Interstate in interstate commerce (1) gas sold directly to industrial customers and excluded from regulation by the terms of the Act, and (2) gas sold for resale and now subject to regulation, likewise make common use of the greater part of the two pipe lines. Such evidence also establishes that certain parts of Colorado Interstate's pipe line are used exclusively by one or the other classes of gas.

In its determination of rates to take the place of contract prices agreed upon prior to the Natural Gas Act, the Commission made no separation or allocation of the property used in common in the intrastate and interstate business, nor of that likewise used in common in the sale of the regulable and unregulable portions of gas in interstate commerce. It did not even separate out property used exclusively in intrastate commerce, nor that used exclusively by the unregulated business in interstate commerce. In lieu of such a separation and allocation of property, it employed what it termed an "allocation of cost," and, upon that basis, Canadian was ordered to reduce its charges for gas sold to Colorado Interstate by the amount of $551,000 annually, and Colorado Interstate was ordered to put into effect rates as of May 20, 1942, which would effect an annual reduction of $2,065,000. (R. V. 1, pp. 140-195, 295.)

Admitting that it had no jurisdiction over the rates charged by petitioner for gas sold directly to industries, nevertheless, the Commission used methods legally applicable only in cases where full rate regulatory jurisdiction exists. In so doing it failed to stay within the jurisdictional boundaries established by Congress. The Circuit Court of Appeals based its affirmance on the impact of the order "in its totality," and thus failed to recognize the jurisdictional importance of the method employed by the Commission. It is only in situations where complete jurisdiction exists that the principles announced in the cases of *Federal Power Commission v. Natural Gas Pipeline Company of America*, 315 U. S. 575, and *Federal Power Commission v. Hope Natural Gas Company*, 320 U. S. 591, can apply. The Commission

went beyond the ambit of its statutory authority and in order to demonstrate that fact it is necessary to present a detailed analysis of the method of allocation proposed by petitioner and the method followed by the Commission.

3. The Company's Evidence.

The jurisdictional requirements can be met only by determining the basic features affecting the property used and held available for use by the regulable gas. These are:

1. The property used exclusively for regulable gas and that used exclusively for unregulable gas.
2. The property used in common by regulable and unregulable gas, and an allocation thereof to the regulable gas of the portion used and held available for use by it, based upon:
   a. The priority rights to line capacity by regulable gas,
   b. The actual use of line capacity in the past by regulable gas and unregulable gas and the volume sold and peak loads experienced during such period, and
   c. The translation of this use into terms of net investment of the property so allocated to regulable gas.
3. The determination of all costs involved in operating the property so allocated to regulable gas and in selling such gas to the customers.

Upon all these points the petitioner presented evidence. The petitioner's witnesses not only separated the property according to its use, but assigned to the several parts the original cost and the present fair value thereof, and the operating expenses with respect thereto, which were summarized in appropriate operating or rate statements. (R. V. 5, pp. 2453-2494.) However, under the limited review now granted, we assume that the dollar amounts assigned to the several classes of property are not material. Only the evidence disclosing the method and principle of separation em-

ployed by the Company, and the failure of the Commission to make any separation at all is here dealt with.

Colorado Interstate's witnesses first separated out the property used exclusively in servicing or supplying the non-regulable gas and that used exclusively in the sale of regulable gas.

The evidence shows that certain lateral lines are used exclusively for delivering gas to customers for resale, and that certain other laterals are used only for delivering gas to direct sale customers. By reference to Appendix B, Commission's flow diagram map, it will be seen that the relatively extensive lateral line branching off from the main line south of Pueblo, Colorado, is used exclusively in the direct sales of gas to Colorado Fuel and Iron Corporation. Similarly, the laterals to the Colorado Portland Cement Company, American Crystal Sugar Company, Atchison, Topeka & Santa Fe Railroad Company, the United States Helium Plant and the Fort Lyon Hospital are all used exclusively in the unregulated business. Other laterals are used exclusively in the regulated business. Such lateral lines were by the petitioner's witnesses assigned to the two classes of business in accordance with their use. (R. V. 4, pp. 2265, 2271.)

Metering stations were likewise divided by the Company's witnesses on the basis of the exclusive use to which they were put. Since each class of business necessarily had its own meters, this separation of property was easily made. (R. V. 4, pp. 2265, 2276-2278.)

After separating the property used exclusively in the regulable or unregulable business, it was then necessary to separate that used in common by both classes of business. The main pipe line from its junction with the Canadian Company's line at Clayton Station, New Mexico, to a point just east of Pueblo, Colorado, a distance of approximately 200 miles, is so jointly used. The remainder of the pipe line from that point north to Denver, a distance of 105 miles, is almost, but not quite, entirely used by the resale or regulable gas, and thus has to be separated on a use basis. This separation necessarily had to take into consideration prior

right to the use of the line by the resale or regulated business over the unregulated business, evidence of which is now summarized:

Evidence as to Prior Right to the Use of the Line by the Regulated Over the Unregulated Business.

The allocation of property used in common by regulable and unregulable gas reflected the priority right to line capacity of gas sold for resale to domestic consumers over all other gas. This preference was a condition precedent to the whole project, was included in all of the contracts between petitioner and its customers, and has been observed in practice. Necessarily these rights are reflected in the actual peak loads and volumes used as data in the allocation of the commonly used property.

The original agreement of April 5, 1927, between the parties who financed and incorporated Colorado Interstate and those who established the Canadian Company contained a provision that the domestic customers (sales for resale to such customers being later subjected to regulation by the Natural Gas Act of June 21, 1938) should have preference and priority over industrial customers in case of shortage of gas for any reason. (R. V, 1, pp. 281-394.)* The carrying out of the project as provided in said original agreement was conditioned upon the acquiring by the distributing companies in Denver and Pueblo of franchises for the distribution of natural gas in lieu of manufactured gas which they were then serving. Such franchises were obtained. The Denver franchise contained this provision in Section 4:

"It is further determined that the rates to be charged by said Company for natural gas service to industrial users for heating, manufacturing and power purposes in the City and County of Denver for the term of said Fran-

*Included in the category of domestic customers are customers frequently classed as commercial, such as laundries, bakeries, restaurants and similar establishments. Gas sold to distributing companies and municipalities for resale to industrial customers, while subject to regulation, has no priority over industrial gas sold direct to consumers. The quantity of such gas sold is relatively small in comparison with direct industrial sales, and sales for resale to domestic and commercial customers. Appropriate treatment is given to this fact in petitioner's evidence.

chise may be lower and different from those charged for domestic purposes and the Company shall have the right to contract with industrial users for the sale of such natural gas, provided that all such contracts contain a 'cut-off' clause which recognizes the preferred right of the domestic users over the industrial users." (R. V. 1, pp. 338, 339.)

The Pueblo franchise in Section 8 contained substantially the same sort of provision, and in the contract between Colorado Interstate and the City of Colorado Springs, which owned and operated its own distribution system, such provisions were also contained.

Provision for such priority was included in all of the contracts of the petitioner with the distributing companies at Denver and Pueblo, and with the company distributing gas to La Junta and a few small villages in southeastern Colorado. (R. V. 2, p. 1024.)

All of petitioner's contracts with its industrial customers were negotiated on the basis of this priority to the resale customers, and of this provision for interruption to their service, and the gas was taken and the price agreed upon on this off-peak load basis (R. V. 2, pp. 801-956), and all such industrial customers acknowledged and conceded such priority or preference in favor of the sales to the distributing companies for resale to domestic customers. (R. V. 2, p. 1024.) Accordingly, it was incumbent upon every industrial customer to make his own arrangements for standby fuel and equipment to take care of such interruptions. (R. V. 2, p. 956.)

Evidence was introduced showing that within the period July 29, 1932, to December 31, 1940, this priority and preferential provision in the contracts had operated *in favor of the domestic customers* on forty different occasions. A table of these interruptions, showing the name of the industrial customer, the date of the beginning of the interruption, the duration of the interruption, and cause of the interruption, is set out in full in the Record. (R. V. 2, pp. 1026-1028.) Interruptions to the industrial customers of the distributing companies are shown under the name of the distributing

company. These forty interruptions ranged in duration from 5 hours to 66 hours. The causes of the interruption in service to such industrial customers were due to high domestic peak load or "freeze-ups" on the main line, or washouts on the main line. (R. V. 2, pp. 1026-1028.) The main pipe line in its course between Clayton, New Mexico, and Denver traverses many creeks, rivers and dry arroyos, and no matter how deep the line was laid and securely anchored, floods, and particularly "flash" floods, were able to cause washouts. (R. V. 2, p. 1030.) Despite these washouts, "freeze-ups" and high domestic peak loads, service was continued without interruption to the preferred domestic customers, even in case of total breaks of the line, because of the ability to use gas stored in the line, or the "line pack," for their service.

> "Beardsley explained that because of gas stored in the line or the 'line pack' the cutting off or cutting back of service to the industrial or commercial consumers always permitted service to the domestic users." (R. V. 2, p. 1028.)

Such use of the gas stored in the line or the "line pack" was explained by the witness Rhodes, who designed the line, as follows:

> "Furthermore, gas can be drawn from the line in excess of its true or continuous capacity through the skillful use of the storage capacity of the line. In long pipe lines a considerable amount of gas is stored in the line on account of the high pressure at which it operates. This stored gas under proper control may be used to supplement the flow capacity of the line to an extent of about 10 per cent for a single day." (R. V. 2, p. 1025.)

The Commission's witness, Kenneth L. Smith, testifying as to studies made by the Commission's Bureau of Engineering, stated:

> "According to information received from the Bureau of Engineering, the average line pack during the year 1939 was 55,362 Mcf., at a pressure base of 16.4 pounds per square inch absolute." (R. V. 2, p. 1025.)

It was by cutting off completely the industrial customers, when that was necessary, and by cutting back or reducing

the supply of gas to such industrial customers when that would suffice, and by the use of the gas stored in the line or the so-called "line pack," that service to the domestic consumers was continued without interruption in all cases despite washouts, freeze-ups, and high domestic peak loads. (R. V. 2, p. 1028.)

Evidence as to the Relative Use of Property for the Regulated and Unregulated Business, and Separation and Allocation of the Property and Expenses with Respect Thereto.

The Company's line was designed and built with a capacity calculated to take care of the maximum demands of the domestic consumers during the coldest weather. (R. V. 2, pp. 1108, 1118.) George I. Rhodes, chief engineer of Ford, Bacon & Davis, which firm was the designer and builder of the line, testified that prior to construction it was necessary to estimate volumes, peak loads and line capacity, and that the preconstruction estimates had been closely borne out. (R. V. 2, p. 1108.) The expense of building a line with capacity sufficient to deliver the maximum requirements of the domestic customers alone for house heating, cooking and other such purposes, that is, for the regulated business, on the coldest expected day in winter, would be prohibitive. (R. V. 4, p. 2298.) Nevertheless, it was necessary to have such capacity available for such domestic customers on the coldest days in order to make the project feasible, because domestic consumers would not buy the gas at all unless it was available on such days. (R. V. 4, pp. 2298, 2315; R. V. 2, pp. 1108, 1110.) He testified that the only solution was to find industrial customers willing to buy gas on an off-peak load or interruptible basis, sales to whom would thus contribute to the cost and operating expense of a line that would have sufficient capacity to take care of the maximum demands of the domestic customers in the coldest weather. (R. V. 4, pp. 2283-2307.) His firm actually designed and built the line with "the least capacity that could be provided to take care of the domestic obligations in the future years, the smallest line that you could reasonably expect to build." (R. V. 4, p. 2297.) Such line had ample capacity to take care of the Colorado Fuel & Iron (C. F. & I.) and the other industrial cus-

tomers on an off-peak load basis at practically no additional cost. (R. V. 4, pp. 2297, 2285.) He added that the line was so built, and that the direct sale industrial customers so acquired on the off-peak load or interruptible basis "must get off the line to the extent required to assure deliveries of domestic gas on the resale contracts." (R. V. 4, p. 2283.)

This witness Rhodes then testified as to the proper separation or allocation of the plant and expense of the whole Denver Line, as between direct sales not subject to regulation, and sales for resale now subject to regulation under the Act. (R. V. 4, pp. 2264-2355.)

The customers of Colorado Interstate to whom sales are made for resale off the Denver Line are: Public Service Company of Colorado, Pueblo Gas & Fuel Company, Citizens Utilities Company, Arkansas Valley Natural Gas Company (whose business has now been taken over by Citizens Utilities Company), City of Colorado Springs, and Colorado-Wyoming Gas Company. (R. V. 4, p. 2265.) (This business is by this witness, and other witnesses in the record, variously referred to as "sales for resale," which is the language of the Act, or as "resale" business, "regulated" business, and "jurisdictional" sales or business.)

The industrial customers to whom direct sales were made, and which sales are not now subject to regulation, are: American Crystal Sugar Company, Atchison, Topeka and Santa Fe Railway Company, City of Colorado Springs, for its power plant, C. F. & I., Colorado Portland Cement Company, and United States Government, for its Fort Lyon Hospital and for its helium plant at Thatcher, Colorado. (R. V. 2, pp. 1108, 1109; R. V. 4, p. 2265.) (This business is referred to by this witness, and other witnesses in the record, variously as sales "not for resale," "direct" sales, "unregulated" sales, "non-jurisdictional" sales or business.)

In making this separation, this witness Rhodes, in compliance with the terms of the Act, counted as "sales for resale" or as "regulated" business, the relatively minor amount of gas sold by Colorado Interstate to the several distributing companies for resale to industrial users. (R. V. 4, pp. 2265, 2268, 2269.)

The Commission's witness O'Connor also studied the deliveries of gas to the regulated and unregulated business in the year 1939, and charted the deliveries on the flow diagram map (R. V. 2, p. 1079), which is contained as Appendix B to this brief. O'Connor shows that except for the delivery to Colorado Portland Cement Company, all of the gas transported through the 20-inch pipe line from the Devine Station near Pueblo to Denver, a distance of 105 miles, is for resale, or is regulated business. This Commission's witness O'Connor on his flow diagram shows graphically that of the 21,407,096 Mcf which passes through the Clayton Compressor Station, 7,257,379 Mcf is delivered to the direct sale customer C. F. & I., at Pueblo, off the 22-inch main line extending between those points. (R. V. 2, p. 1079.) He also shows the other deliveries off this 22-inch portion of the line to the other industrial customers, all of which occur south of the Devine Compressor Station near Pueblo. (R. V. 2, p. 1079.)

Since, as testified to by Rhodes, the greater part of petitioner's property is used in the delivery of gas to both classes, he developed a method properly apportioning to the resale gas that part of the property used and held for use in meeting the obligations of petitioner to those customers having priority rights to line capacity.

As summarized hereinafter, Rhodes' testimony was that, based on the winter of 1939-1940, there should be assigned to the regulated business, because of its relative priority and consequent use, 84 per cent of the cost of the 22-inch main line between Clayton and the Devine Station (Pueblo), 99.48 per cent of the 20-inch main line from Devine Station to Denver, 58.2 per cent of the cost of the Arkansas Valley line, and 42.32 per cent of the cost of other laterals. The weighted average of the cost of all pipe lines assigned to the regulated business is 82.43 per cent.

Rhodes, describing his method, said:

"Certain facilities are devoted exclusively to the sale of resale gas, and certain facilities exclusively to the sale of direct sale gas. By far the greater part of the property is used in the delivery of gas to both classes. This

exhibit develops a method by which there can be allocated to each class of business that part of the total costs fairly representing the share which each class of business should bear.

"Resale gas is the primary business of the Denver line. During peak loads this gas is supplied principally for resale to domestic and small industrial consumers, which constitutes the firm resale load of the line. They have the first call on all the gas in the line. Direct sale gas is the secondary business of the Denver line. This gas is for large industrial consumers served directly by Colorado Interstate. A large part of their requirements can be supplied by other fuels on short notice. The direct sale gas uses available spare capacity of the line when, as and if it is not needed by the resale gas. The same applies to resale gas for large industrial customers. It is appropriate that the firm resale gas with its dominant priority in the line should bear the base of underlying costs and that the direct sale gas and resale special industrial gas should bear the added or increment costs necessary to its supply.

* * * * *

"When two or more classes of business have equal rights at all times to a full and uninterrupted supply of gas from the pipe line then they have equal priority rights. If the available supply of gas from the pipe line is deficient for any cause then the supply to each of the classes of gas is curtailed in like proportion. Each class of gas having equal priority should share costs pro rata.

"When one class of business, however, has the first call on the available supply of gas from the pipe line, and the other class of gas can take only that which is left, then that class of gas with the first call has a primary right or priority. In the event of shortage of gas, those classes of gas with inferior rights must, if necessary, suffer a complete interruption of service in assuring a full supply of gas to that class with the primary right. * * *" (R. V. 4, pp. 2265, 2266, 2267.)

This witness then refers back to his studies of, and testimony with respect to, the "Peak Load Obligations and Line

Capacity of the Denver Line" from 1928 through the winter 1939-1940. (R. V. 2, pp. 1108, 1118.) For each year of that history, he took the peak loads for two summer months, and the peak loads for two winter months, and from those actual operating results ascertained the relation between the decrease in temperature and the increase in the resale load or regulated gas load. (R. V. 2, pp. 1109, 1112, 1113.) This increase in the load of regulated business, he stated was due primarily to the house heating load. We quote the following from the record:

> "The use of gas for house heating begins in some form when the mean temperature falls below 65 deg. F., and such use increases practically in direct proportion as the mean temperature falls below 65 deg. F. The amount by which the mean temperature in any day falls below 65 deg. F. is called the 'degree day deficiency' for that day. For instance, if the mean temperature in any day is 55 deg. F., there are 10 degree days deficiency, and when the mean temperature is 45 deg. F. there are 20 degree days deficiency. The sum of the daily degree days deficiency during any period is known as the 'total degree days deficiency' for that period. In the Exhibit 'degree days deficiency' is abbreviated to 'Ddd'." (R. V. 2, p. 1110.)

From these studies of actual operating results, he determined that for every degree day deficiency in temperature the resale load increased 660,000 cu. ft. per day. (R. V. 2, p. 1110). These studies of actual operations during the history of the project confirmed the preconstruction estimates (R. V. 2, p. 1108) that the line should be built to take care of the domestic load at a mean temperature of 15 deg. F. below zero. (R. V. 2, p. 1111.)

The maximum demands which the Denver pipe line had to be prepared to meet in the event of extreme weather in the several areas are shown as follows:

	Mean Temperature On Coldest Day (Deg. F.)	Estimated Domestic Load On Such a Day (Cu. Ft.)
(a) Denver Area	—14 deg.	42,157,000
(b) Colorado-Wyoming Area	—20	10,775,000
(c) Colorado Springs Area	—16	3,251,000
(d) Pueblo Area	—10	2,230,000
(e) Arkansas Valley Area	—10	1,304,000
(f) New Mexico Area	—6	531,000
(g) Texas Area	—6	1,483,000
Total	—14.5 deg.	61,731,000

(R. V. 2, p. 1111.)

Having thus determined the increase in domestic load per day for each degree day of deficiency in temperature, based on operating results during the history of the line, he then simply calculated the maximum demands of the regulated gas which Colorado Interstate must be prepared to meet for each portion of the line. (R. V. 4, pp. 2268, 2269, 2270.) This demand he ascertained first in terms of percentage of the total flow capacity, and next in percentage of pipe diameter of the different segments of the line (R. V. 4, p. 2269), and, finally, in terms of cost (R. V. 4, p. 2271), which he stated as follows for the winter of 1939-1940:

	To Resale Gas Per Cent
22-Inch Main Line, Clayton Compressor Station to Devine (Pueblo) Compressor Station	84.00%
20-Inch Main Line Devine Station (Pueblo) to Denver	99.48
Arkansas Valley Lines	58.20
Other Laterals	42.32

(R. V. 4, p. 2271.)

As to the Compressor Stations, Rhodes stated:

"The first unit installed at each station is dedicated to and used practically continuously by the primary business on the line and therefore its cost should be borne entirely by the resale business. The costs of additional units of

the stations are chargeable both to resale gas and direct sale gas in proportions reflecting its use for the two services." (R. V. 4, p. 2272.)

He then analyzed the units at each station, and allocated to the regulated business 71.4% of the cost at Clayton Station, and also at the Canyon Station, and 94.5% of the cost at the Devine Station. (R. V. 4, p. 2275.) He then made a study of the telephone system and other general property, and arrived at percentage allocations for each class of such property. (R. V. 4, pp. 2276, 2278.) He likewise made similar allocations of all Colorado Interstate's expense incurred in delivering the gas. (R. V. 4, pp. 2275-2278.) These percentages of allocation or separation of cost and operating expenses were then applied to the Company's property and business. Property used exclusively in the regulated and unregulated business, respectively, and expenses incident to each class, were directly assigned. There was then presented by the Company complete statements of the cost of the property and the expenses applicable to the regulated business. Contrary to the statement in the Commission's Order (R. V. 1, p. 175), the petitioner did present such statements as to the cost of the property and expenses applicable to the regulated business. (R. V. 4, pp. 2263-2316; R. V. 5, pp. 2463-2494.)

Except for the evidence of the Commission's engineer O'Connor, above referred to, no Commission witness offered any testimony as to a separation of the Company's plant or physical properties, as between that used in the regulated and unregulated business respectively. (The absence of such testimony on the part of the Commission's witnesses at the hearing may be explained by the Commission's declaration in its Opinion that "It does not follow, from this obligation of the Commission, that an allocation of physical property or portions thereof, must be made, before any excessive returns are determined, as seems to be the contention of the companies." (R. V. 1, p. 175.))

4. The Commission's Evidence as to Allocation of Costs of Service.

The accounting witness for the Commission made adjustments by way of deduction in the original cost and in the operating expenses. This was done for Colorado Interstate and Canadian separately. Then another accounting witness consolidated all of these revised accounts of the two companies as if they were one, reflecting in such consolidated figures all of such adjustments, and in this consolidated showing the transaction between the two companies, involving the sale and purchase of gas at Clayton, New Mexico, was washed out. (R. V. 4, pp. 2215-2259.)

The Commission's witness Lyon then took these consolidated "adjusted" accounts for the combined companies and made his allocation of costs of service (R. V. 4, p. 2317; R. V. 5, p. 2450), allowing as part of the cost a 6 per cent rate of return on all of the property used in the business, regulated and unregulated. (R. V. 5, p. 2409.) He made no separation or allocation of the property itself, either as between that used in intrastate commerce and that used in interstate business, nor as between that used for resale gas and that used for direct sale gas. (R. V. 4, pp. 2317-2373.) He stated:

> "I have made no allocation, segregation of the property specifically devoted to the service of either of those markets." (R. V. 5, p. 2422.)

On the basis of such combined adjusted costs furnished him by other Commission accountants and examiners, Lyon sought to derive an average or unit "Production Cost." This cost he showed under the heads (1) "Cost of Gas at Wellhead," (2) "Cost of Gathering," and (3) "Residuals—Refining." This third classification is in fact not a "cost," but a credit against the other two classes of costs, and represents the revenue derived from extracting the lighter vapors from the raw natural gas so as to lessen the possibility of "line freezes" during transportation. He admitted that his production costs were average costs derived without any regard as to whom or under what circumstances the gas produced was sold—whether sold to the Denver Line, the Chicago Line, or whether it was intrastate or interstate commerce,

or whether it was the subject of direct sales not subject to regulation, or sales for resale subject to such regulation.

"A. It is an average cost of the gas at the wellhead and is an average cost of the gathering—

"Q. If the word 'system' means the production system or gathering system, that is the system cost?

"A. That is correct." (R. V. 4, p. 2397.)

His attention was called to the fact that the sales for resale had priority over direct sales to industrial customers, and that the "system" had been built and maintained for the preferential and priority service to the sales for resale to the domestic consumers, that is, regulated business. He was asked if in view of those facts it was not improper to use the same average costs for gas for both businesses, that is, the preferred or priority regulated business, and the subordinate and unregulated business, and whether or not it would not be more appropriate to assign a lower or mere incremental cost to such unregulated business. (R. V. 4, pp. 2390-2397.) He replied:

"A. I think the incremental cost feature should be forgotten." (R. V. 4, p. 2397.)

He was also asked whether his "average cost" did not ignore the load factor obtaining and operating in variable favorable or unfavorable degrees with respect to the several classes of business. He admitted that the load factor was of consequence in determining cost, but also admitted that he had ignored it. (R. V. 4, pp. 2390, 2391; R. V. 5, pp. 2414, 2415.)

"Q. What is the significance of the load factor?

* * * * *

"A. Load factor is the ratio of the average load over a designated period to the peak load occurring in that period.

* * * * *

"A. The load factor of gas deliveries is a matter of consequence in determining the cost of rendering the service. (R. V. 4, p. 2390.)

* * * * *

"Q. Now, having gotten this average cost of gas at the wellhead, you applied that to the volume which various customers, shown on Table 1 of your exhibit, took during the year 1939?

"A. Yes.

"Q. Now, I take it that you gave no consideration to the question of load factor of the various deliveries of gas which Canadian River Gas Company makes; that is, as between deliveries made to Bivins for the Denver Line, as we call it, and deliveries that are taken at the wellhead for the Amarillo Oil Company and deliveries that are made to the Fritch Compressor station of Texoma Natural Gas Company?

"A. No, no effect was given to load factor in this allocation." (R. V. 5, p. 2414.)

He agreed that the load factor on the Chicago Line was 95 per cent, or perhaps a little under that, whereas the factor on the Denver Line was only somewhere "between 60 and 70 per cent." (R. V. 5, p. 2415.) Although admitting that the Chicago Line had the better or cheaper operating load factor, he gave that fact no effect.

"Q. And given no effect to the fact that there is a different load factor between the Denver line and the Chicago line?

"A. No effect." (R. V. 5, pp. 2421, 2422.)

Neither did he give any effect to the difference in the maximum monthly demands.

"Q. Now, again, you have given no effect to the difference in maximum monthly demand which is made by the Denver line on the gathering system as compared with the maximum monthly demand which the Chicago gas line demands.

"A. That is again on a uniform volumetric base." (R. V. 5, p. 2421.)

After thus allocating his "Production Cost" on a straight volume or average basis, he then allocated Transmission Costs. (R. V. 4, p. 2317, columns 6, 7 and 8.) These "Transmission Costs" he divided into two parts (1) "volumetric

costs" and (2) "capacity costs." (R. V. 4, p. 2317, Table 1; R. V. 5, p. 2423.)

In allocating his Transmission Costs he treated as a unit, and as if it were one common conduit used by *all* gas, all the transmission system beginning with and including Canadian's Bivins Compressor Station in the field, its transmission line from that point in Texas, with all laterals used in making intrastate deliveries in Texas, and all of Colorado Interstate's transmission line to Denver, with all of its laterals, even though some laterals were used exclusively in delivering direct sales of gas to industrial customers not now subject to regulation. (R. V. 5, pp. 2427-2431.) This transmission system which he treated as a unit or a common conduit he discussed by reference to the Commission's Engineer O'Connor's map, reproduced as Appendix B hereto. (R. V. 5, pp. 2425, 2427.) His attention was directed to the fact that on this flow diagram map of the Commission's Engineer O'Connor, it appeared that of the 21,594,112 Mcf of gas which passed through the Bivins Station in 1939, 7,257,379 Mcf were sold directly to C. F. & I. at Pueblo as a direct sale not subject to regulation, and that this gas made no use whatever of his assumed unit or common transmission system *north of Pueblo*. (See Exhibit 138, Appendix B hereto.)

His attention was likewise directed to the fact that this same Commission's flow map showed for the same year, 1,676,091 Mcf deliveries of direct sale or unregulated gas to Colorado Portland Cement, slightly north of Pueblo, and that north of the Devine Station, the 20-inch line (compared to the 22-inch line south of Pueblo) was used almost exclusively by the resale or regulated gas. (R. V. 5, pp. 2426-2429.) However, he admitted that in computing his "volumetric cost" component of his total Transmission Cost, he gave no consideration to such facts, and he admitted the consideration of such facts would produce a different "volumetric cost" for the regulated and unregulated gas.

"Q. If instead of using this as one system if we blocked it out and took this 22-inch portion of the line and determined the volumetric portion there and prescribed that to every thousand cubic feet of gas that flows through

it, and if we came on up the line, and when we got to the 20-inch line we made that same determination and applied those volumetric costs only to that portion of the gas which flows to that portion of the line, we come out with a different volume unit cost applied to these different customers, don't we?

"A. If you applied costs in a manner different than what I have in this exhibit—

"Q. I mean if we applied it in the manner I stated by allocating the cost of the line to the gas that flows through that line.

"A. That is correct, you would.

"Q. We have a higher volume cost to apply for the Denver gas than we would have for the Colorado Fuel and Iron Corporation or that we would have for the gas that goes into the laterals in the Arkansas Valley?

"A. Your cost would be cumulative, that is correct.

"Q. So that the result of your system of doing this is in effect to build up the cost of service of this direct sale gas which the company sells, isn't it, and reduce the cost of serving the gas that goes all through the line clear to the end of it and is sold for resale purposes only?

"A. I don't follow your direct sales and resales.

• • • • • •

"Q. Will you for the purpose of this discussion—when I say 'direct sale gas,' I mean gas the pipe line company sells for consumption, and when I say "resale gas," I mean gas that it sells to distributing companies, for example, the City of Colorado Springs for resale or distribution.

"You are familiar with the fact that all of the direct sale gas the pipe line company sells for consumption, the main part of it is delivered at Pueblo or south of Pueblo, and then to the Colorado Portland Cement Company just north of Pueblo.

• • • • • •

"Q. So that as I say; the result of your method is to tend to increase your computed cost of gas that this pipe line sells to these industries for consumption and to cor-

respondingly reduce that that goes all the way through the line and comes out at Denver?

"A. I give no consideration as to whether the delivery is made to an industry or to a distribution plant or if it is resale gas or direct consumption. It is a factor, of course, under the method you have outlined that the farther the gas flows the more costs there are to accumulate. Under the method I have followed the geographical distribution of the load within that common cost zone is of no consequence." (R. V. 5, pp. 2429, 2430, 2431.)

In substance, he stated that his Transmission Costs were computed as if all the gas went into a common conduit at Bivins, and came out a common vent at Denver. (R. V. 5, pp. 2428-2431.)

Included in his Transmission Costs were costs due to compression of the gas at the several compressor stations, but in deriving this cost he gave no consideration to the number of times the gas had to be compressed before it was delivered to the respective customers, such as the delivery of the unregulated gas to C. F. & I. at Pueblo, and such as the delivery of the "regulated" gas 105 miles farther on to Public Service Company at Denver, and with respect to which additional compression had to be made. (R. V. 4, pp. 2396-2399.)

"Q. * * * Isn't it true you have considered the Colorado Interstate Gas Company as one common zone? You have not divided it into more than one common cost zone?

"A. The transmission system, that is correct. * * *.

"A. I have treated the transmission system as a single enterprise and have applied the common costs as the basis of determination to all points of delivery in that system. (R. V. 4, p. 2399.)

* * * * *

"Q. I want to ask you with reference to this Exhibit No. 138 which was prepared by Mr. O'Connor, the flow chart showing where the gas comes in where it goes out—you are familiar with that?

"A. Yes, that is Mr. O'Connor's map.

"Q. Here is the delivery, say at Dalhart, Texas, which is a few miles away from Bivins. For every thousand

cubic feet which is taken out of the line at Dalhart you apply that volumetric factor of three cents plus?

"A. Yes, I have.

"Q. So that for every thousand cubic feet of gas taken out at Denver you would again apply that three cents?

"A. That is correct. (R. V. 5, p. 2425.)

* * * * *

"Q. The fact that the gas going to Denver is compressed four times doesn't result in any greater charge against the gas delivered at Denver under your method than the gas that is compressed only once?

"A. That is correct." (R. V. 5, p. 2448.)

His allocation of costs as between the regulated and unregulated business, that is, the direct sales to industrial customers taking gas under the shut-off provisions, gives no consideration to any such curtailments or shut-offs. (R. V. 5, p. 2439.) His allocation of costs is based on operations during the year 1939; and he stated:

"During the year 1939 I have given no effect to any curtailment of service by reason of insufficient pipe line facilities. * * *." (R. V. 5, p. 2439.)

And again:

"A. * * * A dormant clause in a contract which is not exercised and may not be exercised for the life of the contract is a speculative matter." (R. V. 5, p. 2439.)

In this respect, he did not consider or give effect to the fact that these contract clauses had in fact operated on 40 different occasions, because of high domestic peak load or "freeze-ups" on the main line, or washouts on the main line, each resulting in gas deliveries to the direct sale customers, or in the unregulated business, being cut off or cut back for periods ranging from five hours to sixty-six hours. (R. V. 2, pp. 1026-1028; R. V. 5, p. 2439.)

In computing the "capacity cost" component of his "Transmission Costs," he did not give effect to the priority and preferential service rendered in the regulated business just described, and he did not give consideration to the relative use of the line which the regulated business might de-

mand *on the coldest expected day*, but merely took deliveries of regulated and unregulated gas as they happened to occur on February 9, 1939, which he called "the system's peak delivery day," for that particular year. (R. V. 5, pp. 2434-2436; R. V. 4, p. 2319.) He did not testify as to the temperature on that day, but he did state that the total delivery of regulated gas at the Denver gate on that particular day was only 36,104 Mcf. (R. V. 5, p. 2434.) On the basis of the delivery to the regulated and unregulated business on that particular day of that year, he made all of his divisions of "capacity cost" as between the regulated and unregulated business (R. V. 5, pp. 2434-2436; R. V. 4, p. 2319); and in making such division of his capacity costs he treated *all* of the gas as if it entered the transmission system or common conduit at Bivins, and as if such gas used or was transmitted through every part of such unit transmission system, and all came out at one common vent at Denver. (R. V. 5, pp. 2422-2448; R. V. 4, pp. 2317-2373.)

The witness Lyon in his treatment of capacity costs placed all industrial gas in one category, irrespective of whether it was sold directly by Colorado Interstate or sold to the distributing companies for resale. Using his peak day demand as of February 9, 1939, when, as the United States weather reports hereinafter referred to show, the mean temperature was 8 deg. above zero, and much warmer than the coldest temperature experienced and to be expected in the area, he stated (R. V. 4, p. 2319, line 51, columns 7 and 8) that the total industrial sales, both regulated and unregulated (column 8) were 52,328 Mcf, and the regulated domestic and commercial gas sales (column 7) were 42,670 Mcf. The industrial gas, both regulated and unregulated, is shown as 55.083 percent of the total sales on that day, and the domestic and commercial gas, being all regulated, is 44.917 percent of the load. These percentages are used by Lyon in computing his "capacity cost" component of his "transmission cost" as between the industrial gas, both regulated and unregulated, and the domestic and commercial regulated gas. He made no attempt to classify the industrial gas between resale gas and direct sale gas, treating all gas on the basis of the character of consumption rather than whether it was subject to regulation or not. (R. V. 5, pp. 2441-2442.) His

determinations evidently were adopted by the Commission, although the Commission's Opinion does not disclose the manner in which it actually separated the direct industrial sales from sales made for resale to industrial customers.

Petitioner's evidence (and it was undisputed) contradicting the Commission's evidence, showed the actual peak demands on January 24, 1940 (R. V. 4, p. 2269), when the mean temperature was 1.5 deg. below zero, and far above the lowest temperature experienced and to be expected in the area (R. V. 4, p. 2268). It was there shown that on that actual peak day in January, 1940, sales of the regulated gas amounted to 67,783 Mcf as against the direct sales of gas in the amount of 47,343 Mcf. These figures cannot be compared with those of Lyon referred to above, since petitioner's evidence states the volumes in terms of regulated and unregulated gas. Petitioner's witness then translated such actual peak day demand into what would have been the peak day demand had the mean temperature been 15 deg. below zero, and showed that the load would have been 79,385 Mcf for the regulated and 47,343 Mcf for the unregulated gas. This is to be compared with the ratios used by Lyon on his selected day when the mean temperature was 8 degrees above zero.

The allowed return of 6 per cent on petitioner's property was divided by the witness Lyon equally between volumetric costs and capacity costs. Income taxes were allocated as was return.

Thus the witness Lyon, beginning with the adjusted cost furnished him by the other Commission accountants and examiners, which reflected all of the adjustments and deductions made by these witnesses, then made the foregoing allocations and derived what he called "allocated cost." He then compared these allocated costs with the actual revenue received in 1939 from each customer, regulated and unregulated. (R. V. 4, p. 2317.) (Although this evidence of its witness Lyon was the only evidence presented by the Commission at the hearing on this subject of allocated cost, and from which it derived its so-called "excess revenue" over "costs," we are not able to identify or reconcile this evidence as to his "allocated costs" with the costs used by the Commission in its Order. (R. V. 1, p. 181.))

SPECIFICATION OF ERRORS.

1. The Commission, in purporting to fix reasonable rates for gas sold by the petitioner for resale in interstate commerce, and now subject to its regulation, violated the requirements of the Fifth Amendment to the Constitution of the United States and of the Natural Gas Act when it treated petitioner's property and that of Canadian as a unit, and failed to make any separation of the property and expenses as between that applicable to interstate commerce and that applicable to the intrastate sales in Texas, or between that applicable to the sales for resale and that incident to the direct sales to industrial customers over which it has no jurisdiction; and the Circuit Court of Appeals erred in affirming the Order.

2. The Commission's "allocation of cost of service" is not a valid substitute for the required separation of property and expenses, in that it results in burdening non-regulable gas with costs actually incurred in the sale of the regulable gas, and in the regulation of business over which it has no jurisdiction, contrary to the limitations of the Fifth Amendment and of the Natural Gas Act; and the Circuit Court of Appeals erred in affirming the Order.

ARGUMENT.

The basic question presented to this Court is one of jurisdiction. Admittedly, the jurisdiction of the Commission extends only to sales of natural gas made in interstate commerce for resale. Sales made by natural gas companies in intrastate commerce and those made in interstate commerce directly for consumption are not subject to the jurisdiction of the Commission. (Section 1, Natural Gas Act, Appendix A.) The Commission so recognized this lack of jurisdiction in principle (R. V. 1, pp. 174-177), as did the Circuit Court of Appeals. (R. V. 8, p. 5087; 142 Fed. (2d) 943, 958.) However, in arriving at its conclusions as to petitioner's rates, this jurisdictional principle was forgotten by the Commission, and completely disregarded by the reviewing court.

The gas sold directly to industrial customers for consumption amounted in 1939 to 11,663,832 Mcf at contract pressure base. Gas sold for resale from the Denver Line amounted to 11,598,073 Mcf at contract pressure base, of which 6,818,497 Mcf was for domestic and commercial consumption, and 4,779,576 Mcf for industrial consumers of the distributing companies. (R. V. 2, p. 1105.) We are dealing with a substantial part of petitioner's business in our consideration of the action of the Commission in the assignment of costs to the unregulated business.

We are not now concerned with the correctness of the Commission's action within the ambit of its statutory authority. The rules for testing the validity of a commission order stated in the cases of *Federal Power Commission v. Natural Gas Pipeline Co.*, 315 U.S. 575, and *Federal Power Commission v. Hope Natural Gas Co.*, 320 U.S. 591, can have no application here. In those cases this Court dealt with action taken by the Commission on matters over which Congress had conferred jurisdiction upon the Commission. In declining to go into the methods employed by the Commission in fixing rates in those cases, and in looking only to the result of the rate orders in their totality, this Court limited such rules to jurisdictional action. As said by this Court in the *Natural Gas Pipeline* case:

"* * * Agencies to whom this legislative power has been delegated are free, within the ambit of their statutory authority, to make the pragmatic adjustments which may be called for by particular circumstances. Once a fair hearing has been given proper findings made and other statutory requirements satisfied, the courts cannot intervene in the absence of a clear showing that the limits of due process have been overstepped. If the Commission's order, as applied to the facts before it and viewed in its entirety, produces no arbitrary result, our inquiry is at an end."

In the *Hope Natural Gas* case this Court reaffirmed the position previously stated, and added that

"* * * Under the statutory standard of 'just and reasonable' it is the result reached not the method employed which is controlling. * * * It is not theory but the impact of the rate order which counts. If the total effect of the rate order cannot be said to be unjust and unreasonable, judicial inquiry under the Act is at an end. The fact that the method employed to reach that result may contain infirmities is not then important."

The Circuit Court of Appeals in its consideration of the Commission's order failed to observe the distinction between action by the Commission within and action without the ambit of its statutory authority. After reciting the illegalities in the Commission's method of cost allocation, as contended for by petitioner, the Court said:

" * * * It may be conceded, without deciding, that the method is not free from defects or imperfections in all its aspects. But even so it cannot be said that as the consequence, the impact of the orders of reduction, each in its totality, produces arbitrary results or oversteps the bounds of due process. Therefore the orders are not open to further judicial inquiry on these grounds. Federal Power Commission v. Natural Gas Pipeline Co., supra; Federal Power Commission v. Hope Natural Gas Co., supra." (R. V. 8, p. 5088; 142 Fed. (2d) 959.)

The judicial inquiry by this Court must be directed to the methods employed by the Commission in order to determine

if the Commission transgressed the jurisdictional limits imposed by Congress.

As the evidence indisputedly shows, the Commission accountants, after dealing with Colorado and Canadian Companies separately, and after rejecting from the rate base of each the original cost of considerable items of property, and after computing for each company large depreciation book reserves which it treated as representing accrued depreciation in the property which they deducted in each case from the "original cost" and "rate base" of each company, and after adjusting downward the annual expenses of each company, they then, very strangely, consolidated these accounts, so adjusted by them, into one account, or "pot," if it may please the Court. This conglomerate included the revenues and expenses of Canadian Company in respect to its intrastate sales in Texas, and it, likewise, included the revenues and expenses of both companies in respect to direct sales of gas to industries not now subjected to regulation under the Act. This conglomerate included as part of the "cost of service," a so-called "fair return" upon the property which the Commission witness Lyon, in his testimony, fixed arbitrarily, as he admitted, at 6 per cent. (R. V. 5, p. 2408), but which the Commission in its Opinion raised to 6½ per cent (R. V. 1, p. 173). This return, so limited, was used for the unregulated as well as the regulated business in determining the cost of service. From this conglomerate, the Commission witness Lyon attempted, without any separation of the property as between the intrastate and interstate, or between the resale and direct sale, or the regulated and the unregulated business, to allocate the cost of service in respect to the regulated business. It is to be remembered that this conglomerate, which Lyon thus sought to allocate was based upon the consolidated accounts of the two companies, but very strangely, the Commission in its Opinion, for some reason, departed from the testimony of its own accountants, and sought to derive an allocated cost for each company separately. We, ourselves, have never been able to ferret out just what the Commission did, because of its failure to make appropriate findings with respect to this matter. We do know that the Commission took the cost of service, in some

manner derived by it, and which, as above stated, we cannot identify with the cost testified to by its witnesses, and then compared those costs to the Company's actual revenues in 1939, and finally derived what the Commission called "excess revenues," upon which the ordered rate reductions were based.

With this preliminary statement, we now deal with our two questions and Specification of Errors.

1. *The Commission, in purporting to fix reasonable rates for gas sold by the petitioner for resale in interstate commerce; and now subject to its regulation, violated the requirements of the Fifth Amendment to the Constitution of the United States and of the Natural Gas Act when it treated petitioner's property and that of Canadian as a unit, and failed to make any separation of the property and expenses as between that applicable to interstate commerce and that applicable to the intrastate sales in Texas, or between that applicable to the sales for resale and that incident to the direct sales to industrial customers over which it has no jurisdiction; and the Circuit Court of Appeals erred in affirming the Order.*

That the Commission failed to make such a separation or allocation is, of course, candidly admitted in its Opinion:

> "The Commission is aware that in an investigation such as this it is incumbent on it to determine the reasonableness or unreasonableness of the rates and charges subject to its jurisdiction. * * *
>
> "It does not follow, from this obligation of the Commission, that an allocation of physical property or portions thereon, must be made, before any excessive returns are determined, as seems to be the contention of the companies." (R. V. 1, pp. 174, 175.)

Now where property is used in public service, it is universally acknowledged that the owner must be paid for that use. Where the owner uses such property only part time, or uses only a part of the whole property in such service, he is only entitled to be paid to the extent of that use. Where he devotes the same property during a part of the time, or

a part of the whole property, to some purely private venture, he can demand for such use in such private venture simultaneously carried on, whatever compensation may be agreed upon between him and the other parties in interest. The owner is not limited to any specific rate of return on his investment, as is done where a public service is rendered. This being the case, it would seem to follow, from a simple application of common sense, and without any elaborate argument, and without any citation of authority, that a separation of the property, based upon use, must be made in order to determine the payment that is due for such use in the public service. This proposition is so not only as a matter of plain common sense, but it exists in this case as a matter of jurisdictional limitation, imposed both by the constitution and the statute. It was incumbent upon the Commission, as an administrative body, in order not to transcend its jurisdiction, to draw and observe two jurisdictional boundaries: first, the boundary line between intrastate and interstate commerce, and, second, the boundary between sales for resale and direct sales not subject to regulation under the Act. It is circumscribed by each of these boundaries.

This Court has laid down these axiomatic limitations on administrative boards and commissions in emphatic language. In *Smith v. Illinois Bell Telephone Co.*, 282 U.S. 133, 146, where intrastate rates were involved in a state commission order, and where some of the property was used in common for intrastate and interstate business, Chief Justice Hughes said:

> "At the threshold of the discussion, we are met with the fact that, in these findings, the commission and the court made no distinction between the intrastate and the interstate property and business of the company. It appears that the property of the company in Chicago is used to render (1) what is called exchange service, all of which is intrastate, (2) intrastate toll service over its own lines and under arrangements with companies other than the American Company, and (3) interstate toll service, which includes all the toll service rendered under arrangements with the American Company. The company introduced evidence separating the intrastate and interstate business

and also the intrastate exchange business. While the court regarded these computations as correct, and approved the method in which they had been made, still the court made no specific findings based on a separation of the intrastate and interstate property, revenues and expenses, but determined the issue on the basis of the total Chicago property of the company.

* * * * *

"The separation of the intrastate and interstate property, revenues and expenses of the company is important not simply as a theoretical allocation to two branches of the business. It is essential to the appropriate recognition of the competent governmental authority in each field of regulation. * * * The proper regulation of rates can be had only by maintaining the limits of state and federal jurisdiction, and this can not be accomplished unless there are findings of fact underlying the conclusions reached with respect to the exercise of each authority. In view of the questions presented in this case, *the validity of the order of the state commission can be suitably tested only by an appropriate determination of the value of the property employed in the intrastate business* and of the compensation receivable for the intrastate service under the rates prescribed. * * * As to the value of that property, and as to the revenue and expenses incident to that business, *separately considered*, there should be specific findings, Railroad Commission v. Maxcy, 281 U.S. 82, 83, 74 L. Ed. 717, 718, 50 S. Ct. 228." (Emphasis supplied.)

The same rule was announced in the *Minnesota Rate Cases*, 230 U.S. 352, 435, in the following language:

"Where the business of the carrier is both interstate and intrastate, the question whether a scheme of maximum rates fixed by the state for intrastate transportation affords a fair return *must be determined by considering separately the value of the property employed in the intrastate business* and the compensation allowed in that business under the rates prescribed. This was also ruled in the Smyth Case (id. p. 541). The reason as there stated, is that the state cannot justify unreasonably low rates for domestic transportation, considered alone, upon the ground

that the carrier is earning large profits on its interstate business, and, on the other hand, the carrier cannot justify unreasonably high rates on domestic business because only in that way is it able to meet losses on its interstate business." (Emphasis supplied.)

This opinion also most emphatically rejects the notion that this required separation of property or separation of capital items and expenses incident thereto can be substituted for by any formula based merely on revenue and expenses, or cost accounting, or particularly, as in that case, revenue; a thing akin to what the Commission attempted to employ in this case. The fallacy of this attempted substitute, of course, lies in the fact that such a process involves circuitous and inconclusive reasoning or argument, or is just another illustration of the dog chasing his tail. The Court in this *Minnesota Rate Case* continued by saying with respect to this method:

"When rates are in controversy, it would seem to be necessary to find a *basis for a division of the total value of the property* independently of revenue, and this must be found in the use that is made of the property. That is, there should be assigned to each business that *proportion of the total value of the property* which will correspond to the extent of its employment in that business. * * *." (Emphasis supplied.)

In the cases we have cited, the jurisdictional boundary line being considered was that between intrastate and interstate business, which directly concerns us here, but the principle of the foregoing decisions, as is specifically indicated in *Smith v. Illinois Bell Telephone Co.*, supra, also applies with equal force to cases where the jurisdictional boundary is that line between regulated and unregulated business, with which we are also here concerned.

See also:

Wabash Valley Electric Co. v. Ralph M. Young, et al., 287 U.S. 488, 493, 77 L. Ed. 447, 451.

Illinois Bell Telephone Co. v. Mounihan, et al., 38 Fed. (2d) 77, 83.

United Fuel Gas Co. v. Public Service Commission of West Virginia, 14 Fed. (2d) 209, 224.

Our case is to be distinguished from those cases where here are no jurisdictional questions and no combinations of egulated and unregulated business. Such, for example, as *Columbus Gas & Fuel Co. v. Public Utilities Commission of Ohio*, 292 U.S. 398, 408. This case was cited y the Court below as authority to sustain the Commission's ailure to make a separation of property in the instant case. pparently the Court below failed to realize that in that ase the Commission had complete jurisdiction over all of the perations of the Company in Ohio, and there was no combiation of regulated and unregulated business, and the only llocation there involved or necessary was as between the unicipality of Columbus and other municipalities in Ohio. ther cases involving a like situation may be found and cited y respondent, but, obviously, they are inapplicable.

The Commission witnesses, and the Commission itself in its pinion, all concede that the direct sales to industries are not ubject to regulation under the Act. They could not take any ther position, in view of the plain language of the Act itself, nd in view of the discussions in Congress preceding its enactent (Vol. 81, No. 124, Congressional Record, July 1, 1937, p. 675, et seq). Congressman Lea, the author of the Bill, stated the Committee hearings, and on the floor, that direct sales industrial companies (such as C. F. & I. in this case) for eir own private consumption were not intended to be regu-ted, and would not be affected by the Act.

This Court in the cases above cited has recognized the fficulties that are sometimes encountered in making a sepration of property or capital employed in the business subct to the jurisdiction of the regulatory board from that not bject to its jurisdiction. But, as it also points out, such fficulty affords no excuse for failing to make such a sepration. *Simpson v. Shepard* (Minnesota Rate Cases), 230 .S., at page 432. Furthermore, there is no great difficulty making a separation, as demonstrated by the separations ade by the Company in this very case. That evidence was at the witness Rhodes, who checked the design of the line, d whose firm constructed the line and operated it for some ars under a management contract, with his engineering astants, made a separation of the property and the capital

items with respect thereto, based upon the actual use of the property in the two businesses. The Commission witnesses did not challenge the accuracy of that separation. The Commission, in its Opinion, does not challenge the accuracy of that separation, but simply ignores it. In this connection, we want to point out that we were under no burden or obligation to make any such separation. The Commission was challenging our *contract prices* agreed upon by our Company and its contract customers in 1927, or thereabouts, in contracts that were to continue for 20 years. (R. V. 2, pp. 801-846.) The Commission, in its Opinion, admits that it was incumbent upon it to establish the unreasonableness of those prices as a condition precedent to any reduction, and this, of course, is elementary law. *Wichita Railroad and Light Co. v. Public Utilities Commission*, 260 U.S. 48. If the case were different, and we were involved in a proceeding where the Company was before the Commission petitioning for an increase in rates *which had been originally fixed through the regulatory process*, which had been in effect for some time, and which, therefore, were presumably reasonable, then it might be incumbent upon petitioner to separate out its regulated business from the unregulated business, in order to sustain the general burden imposed upon petitioner in that assumed situation of demonstrating that the rates for the regulated business were unreasonably low. But that, as the Commission itself admits in its Opinion, is not our case. (R. V. 1, p. 174.)

The Commission has not contended, and it could not contend, that the Natural Gas Act itself furnishes any basis for its failure to make a separation of the property and expenses, as required by the decisions of this Court above discussed. This Court, in *Federal Power Commission v. Hope Natural Gas Co.*, supra, thus characterized the Natural Gas Act:

> "The Committee Report stated that the Act provided 'for regulation along recognized and more or less standardized lines' and that there was 'nothing novel in its provisions.' H. Rep. No. 709, supra, page 3."

Furthermore, when the Federal Power Commission through its solicitor, Mr. Dozier De Vane, appeared before the Com-

mittee on Interstate and Foreign Commerce of the House, to explain the provisions of Section 211 (a), which later became Section 208 of the Federal Power Act, the principle of separation of property was acknowledged as follows:

"Mr. De Vane. Yes sir; that is one of the sections that I referred to in connection with section 201.

"You will find that subsection (a) of section 211 provides that the Commission shall have power to ascertain for the purpose of this bill, actual legitimate prudent cost of the property of every public utility and every fact which, in its judgment, may or does have any bearing on the determination of such cost.

"Now, that fits right into the picture of the *separation of this property* between State and Interstate use.

"In this separation, we know of no way of dividing it other than that specified by the Supreme Court of the United States in the Minnesota rate case. Where you can ascertain the cost of the *property*, you can readily determine what percentage of the *property* is used in interstate commerce, and what percentage is used in intrastate commerce, and you can divide for the benefit of the Federal Commission and the State commissions that part of the *property* that is used in interstate commerce, which will determine rates, and that part that is used in intrastate service, upon which intrastate rates will rest." (Emphasis supplied.)

Hearings Before the Committee on Interstate and Foreign Commerce, House of Representatives, 74th Congress, First Session, on H. R. 5423, page 505.

Section 6 (a) of the Natural Gas Act was based upon Section 208 of the Federal Power Act, and the comments of Mr. De Vane are pertinent thereto.

The separation of *physical properties*, which the Commission's spokesman there conceded would have to be made between the interstate and the intrastate business excluded by the Constitution, would, of course, be equally necessary as

between the resale business and the direct sales to industrial customers excluded by the terms of the Act.

The Commission in its Order having candidly admitted that it made no separation of the property (R. V. 1, pp. 174-175), it not only follows that its conclusions as to reasonable rates for the regulated business are based on mere guesswork and speculation, but more importantly, it also follows that the Commission has failed to observe and has transgressed two jurisdictional boundary lines. The first jurisdictional boundary line between interstate and intrastate business is laid down both by the Constitution and the Natural Gas Act; and the second, the boundary dividing interstate sales into those for resale and those made directly to industrial customers, is laid down by the Natural Gas Act. This error is jurisdictional and vitiates the entire Order. No appraisal by this Court of the "end result," or of the rates fixed as being reasonable, can possibly excuse these demonstrated transgressions of constitutional and statutory limitations on jurisdiction.

2. *The Commission's "allocation of cost of service" is not a valid substitute for the required separation of property and expenses, in that it results in burdening non-regulable gas with costs actually incurred in the sale of the regulable gas, and in the regulation of business over which it has no jurisdiction, contrary to the limitations of the Fifth Amendment and of the Natural Gas Act; and the Circuit Court of Appeals erred in affirming the Order.*

It is inconceivable to us that this Court can approve this Order in the face of the Commission's admission that it made no separation of the property, and in view of this Court's repeated direction that in all such cases where jurisdictional limitations are involved and there is a combination of regulated and unregulated business, a separation must be made in order that there may be determined for the regulated part of the business proper operating expenses, annual depreciation of property, and an appropriate return upon the property used in the regulated business. But, in any event, the Commission's attempted substitute or "allocation of costs," since it fails to include at any stage a separa-

tion of property based on use, not only operates to regulate business over which the Commission has no jurisdiction, but in fact siphons costs from the regulated sales to the detriment of the unregulated business, and appropriates earnings from the unregulated business in order to effect a reduction in rates for the regulated; all of which deprives petitioner of its property without due process of law. The Commission's method produces these unconstitutional results.

Some of the errors in the method are easily demonstrated because they arise from a disregard of material facts which, as will be hereinafter pointed out, the Commission itself in its Opinion admits it disregarded. Other errors may not be so easily displayed, for the reason that the Commission failed to make appropriate findings on this matter. Except for announcing the final figures as to cost and comparing them to the Company's revenues for the year 1939, in order to direct a reduction for the future in such revenues, the Commission resorts to generalities. It says:

"All that can be accomplished by an allocation of physical properties can be attained by allocating costs including the return. The latter method is by far the most practical and business-like.

. . . . . .

"Commission staff exhibits on cost allocation followed principles that have long been recognized as reasonable in the public utility field and are widely accepted. Therein costs are divided essentially into two groups, fixed and variable. Fixed costs are largely joint costs which do not vary with volume of sales. The total amount of such costs are largely proportional to the maximum demand on the system or system capacity. Accordingly, these costs have been allocated basically in proportion to each customer's responsibility for the peak day demand. Variable costs are largely those that vary proportional to output or volume of sale. Accordingly, these costs have been allocated in proportion to volume of gas purchased by each customer.

"The principles and methods of cost allocation presented by Commission staff are obviously the most appropriate and reasonable for Canadian and Colorado Com-

panies. Applying the physical and operating data submitted in evidence by Commission staff to total costs for each company results in the allocations shown in the following table. * * *." (R. V. 1, p. 175.)

The Commission gave no references to court or commission decisions, text book citations, or articles in trade journals in support of its contention that its method of cost allocation was a recognized one in the public utility field, was the most practical and businesslike, and widely accepted. The legal authorities are decidedly to the contrary, as we have shown.

The Commission then announced its final "allocated costs." These announced costs in the Commission's Opinion cannot be identified with the costs derived by Lyon, its only witness on this subject. For example: Lyon never did derive or announce any cost to Colorado Interstate for gas sold to it by Canadian at Clayton Junction; but he and the accounting witness who preceded him dealt with the two companies together, and "washed out" the cost between them at Clayton Junction. Furthermore, at no place in the Commission's Opinion are there any findings as to "fixed" costs, "variable" costs, "joint" costs, or any basic findings which disclose just what the Commission has done.

This failure to make appropriate findings in itself constitutes reversible error, *U.S. v. Carolina Freight Carriers Corporation*, 315 U.S. 475, 488-489, 86 L. Ed. 971. There this Court said:

"* * * It is impossible to say that the standards which we have set forthwere applied to the facts in this record. Hence, as in Florida v. United States, 282 U.S. 194, 215, 75 L. Ed. 291, 304, 51 S. Ct. 119, the defect is not merely one of the absence of a 'suitably complete statement' of the reasons for the decision; it is the 'lack of the basic or essential findings required to support the Commission's order.' And see United States v. Baltimore & O. R. Co., 293 U.S. 454, 464, 79 L. Ed. 587, 594, 55 S. Ct. 268; United States v. Chicago, M. St. P. & P. R. Co. 294 U.S. 499, 510, 511, 79 L. Ed. 1023. * * * Congress has prescribed statutory standards pursuant to which those rights are to be determined. Neither the Court nor the Commission is war-

ranted in departing from those standards because of any doubts which may exist as to the wisdom of following the course which Congress has chosen. Congress has also provided for judicial review as an additional assurance that its policies be executed. That review certainly entails an inquiry as to whether the Commission has employed those statutory standards. If that inquiry is halted at the threshold by reason of the fact that it is impossible to say whether or not those standards have been applied, then that review has indeed become a perfunctory process. * * * An insistence upon the findings which Congress has made basic and essential to the Commission's action is no intrusion into the administrative domain. It is no more and no less an insistence upon the observance of those standards which Congress has made 'prerequisite to the operation of its statutory command.' Opp Cotton Mills v. Administrator of Wage & Hour Division, 312 U.S. 126, 144, 85 L. Ed. 624, 635, 61 S. Ct. 524. Hence that requirement is not a mere formal one. Only when the statutory standards have been applied can the question be reached as to whether the findings are supported by evidence. * * *."

More recently, in *Interstate Commerce Commission, et al. v. Columbus and Greenville Railway Company*, 319 U.S. 551, 87 L. Ed. 1580, Mr. Justice Douglas in a concurring opinion referred to *United States v. Chicago, M. St. P. & P. R. Co.*, 294 U. S. 499, and stated:

"Mr. Justice Cardozo speaking for the Court stated in the latter case, 'We must know what a decision means before the duty becomes ours to say whether it is right or wrong.' 294 U.S. p. 511. That was said about another obscure and vague report of the Interstate Commerce Commission. We should say the same thing about the present report. The questions left unanswered by this report may be simple ones to experts. But we should have those answers before we put the imprimature of this Court on the Commission's order."

Such lack of findings, or such vague findings, are especially injurious to the petitioner in a case like the present. Here, the Commission is already exercising all of the functions, except that of judicial review. Once it was thought that

no one could be a judge in his own case. Under the currently prevailing system of administrative law, one and the same governmental entity, such as the Commission in this very case, frequently occupies and exercises the function of complainant, witness for the complainant, counsel for the complainant, and then decides the issues of fact, and, to the extent that such is necessary, the issues of law. Now, conceding to the Commissioners the very highest motives and integrity, such a system is inherently dangerous to parties whose rights are being so determined. The only function in the whole process that is not entrusted, in the final analysis, to the Commission is that of judicial review. If, in a case like the present, where the Printed Record is enormous, the making of basic findings is excused, or vague findings are tolerated, it will result in the nullification of any real judicial review, with the necessary result that from the beginning to the end, that is, from the filing of the complaint to the compulsion of the new rate, everything will be determined, in effect, by the same mind and the same functionary.

The rights of parties can only be protected by according to them full constitutional guaranties, and by an insistence upon a clear and explicit application of the statutory standards.

Despite the lack of appropriate findings we are, nevertheless, able to demonstrate at least the following errors in the Commission's method:

First, we know, as already demonstrated in the first part of our argument, that this method makes no separation, allocation or segregation of the plant and property of either company, separately or combined, (1) as between that devoted to intrastate and that devoted to interstate business, or (2) as between that used in selling gas for resale and that used for direct sales not subject to regulation. (R. V. 4, pp. 2317-2373.) When Lyon was asked about the intrastate market of Canadian in Texas, and the direct sales by Colorado Company to industries, which sales are not now subject to regulation, he stated:

"A. I have made no allocation, segregation of the property specifically devoted to the service of either of those markets." (R. V. 5, p. 2422.)

The failure of this Commission engineer to make any such separation of property was in obedience to the Commission's established practice to the effect that, as announced in its Opinion (R. V. 1, p. 175), no "allocation of physical property or portions thereon (sic)" need be made.

Secondly, we know beyond any doubt that the Commission's witness Lyon, in deriving these "costs," and in allocating them, ignored the priority and preferential use of the property which is granted to the regulated domestic and commercial gas as against the industrial business, both regulated and unregulated. The undisputed evidence shows that such priority and preference was made a matter of contract between all parties in interest, and was approved by the municipalities involved. Furthermore, the equally undisputed evidence is that this contractual provision has been scrupulously observed and carried out in practice. This evidence showed that within the period between July, 1932, and December 31, 1940, there had been forty interruptions in the service to direct sale industrial customers, due to high domestic peak loads or "freeze-ups" or washouts on the main line, and that these interruptions ranged in duration from five to 66 hours each. (R. V. 2, pp. 1026-1028.) Over this seven and one-half year period of time, records of which were introduced, the interruptions to the unregulated business averaged a little more than five occasions per annum; and, of course, it will be recognized that as the field pressures decline, the frequency and duration of such interruptions is bound to increase.

Despite this undisputed evidence, Lyon, in making his allocation, stated:

"During the year 1939 I have given no effect to any curtailment of service by reason of insufficient pipe line facilities. * * *." (R. V. 5, p. 2439.)

And again:

"A. * * * A dormant clause in a contract which is not exercised and may not be exercised for the life of the contract is a speculative matter." (R. V. 5, p. 2439.)

The exhibits of this Commission witness were prepared

and introduced, and his testimony given, in the face of the plain provision in all of the contracts and municipal franchises providing for preferential service to the regulated business, all of which had theretofore been introduced in evidence. Accordingly, there can be no excuse for the ignoring of these specific provisions. It is true that these exhibits, and this testimony on the part of the Commission, preceded the Company's testimony (undisputed) contained in Exhibit 290 (R. V. 2, pp. 1024-1030), showing the actual interruptions or curtailment of service to the unregulated business, because of priority and preferential service to the regulated business, resulting from various causes over the seven and one-half year period. The Commission's witness thereafter had full opportunity to amend his testimony and exhibits, but did not do so, and the Commission has accepted his testimony, and thus itself ignores these undisputed and vital facts.

As to this ignoring of the priority in the use of the plant and property accorded to the regulated business by contract and in practice as against the unregulated business, we quote the very excellent statement of the late Judge McDermott contained in his opinion in *Wichita Gas Co. v. Public Service Commission*, 3 Fed. Supp. 722. There, as Circuit Judge, he was sitting in the District Court for the District of Kansas in a suit by the Gas Company to enjoin the order of the Public Service Commission of the State of Kansas. One of the issues was the reasonableness of the 40-cent gate rate which the Gas Company was paying to another company. The Commission challenged the reasonableness of that rate by citing the fact that the same pipe line company sold gas to industrial consumers in and near Wichita for 20 cents. At page 725 Judge McDermott said:

> "The defendants' principal argument is that the supply company sells to industrial consumers and other purchasers, in and near Wichita, for 20 cents. The argument is faulty because it overlooks the load factor. The whole difficulty with domestic gas is that domestic users consume more gas in winter than in summer. The average domestic consumption in Wichita is 4,800 M per day. Yet on certain days, the domestic consumption runs to 40,000 M per

day. The domestic user needs his gas more on the cold days than the warm ones. The result is that enough gas must be produced or contracted for, and big enough lines built, to furnish 40,000 M per day. On 364 days, there is a surplus of gas and equipment. The plant is eight times too large for the average load; but it must be, or the people be short of gas when they need it most. Now the problem is, what is to be done with the surplus gas and surplus equipment? Is it better for all to make use of it, or let it lie idle? If it lies idle 360 days in the year, the loss is terrific; if surplus equipment and surplus gas is used in competition with coal, at a competitive price, whatever comes in from that source would look like clear gain. It appears to me that the net result of selling the surplus gas at 20 cents is to reduce the cost of gas to the domestic consumer. Some return is accruing from the otherwise idle equipment. I can see no fair comparison between selling surplus gas to an industry with an ordinarily constant load factor, reserving the right to shut off its gas at any moment, and the service of standing by ready to serve a domestic user with whatever he wants, from 30 feet a day in summer to 1,000 feet a day in winter. The situation is not unlike an ocean liner: it is built to carry 1,000 passengers; to carry them, it is necessary to build a ship that will carry ten times the weight of the passengers; the surplus capacity may be used for either ballast or freight. The passengers should not complain if freight is carried, although the rate per pound is much less than the rate per pound charged the passenger."

The evidence which we have already summarized and adverted to in this argument shows that in our case the line could not have been built had there not been both the direct sale and resale business available. The Commission in its Order, referring particularly to the contract with C. F. & I., states that its procurement was one of "the essential prerequisites of the construction of the * * * line." (R. V. 1, p. 142.) The willingness of these industrial customers to take the gas at a cheaper rate because of their inferior position, and their willingness to be "cut back" or "cut off" in cold weather, when the priority rights of the domestic customers

demanded the use of the line, made the building of the line possible. All parties in interest agreed to this. All customers understand it. The City of Denver approved it in its franchises and ordinances, as did Pueblo, and Colorado Springs recognized it in the contract it made with the Company for the supply of gas to its municipally-owned distribution system. Now the Commission chooses to ignore the inferior position of the non-regulable business by reason of these contract provisions, and enters an order that operates to shift costs from the regulable business to such non-regulable sales.

In the third place, we know that in the allocation of "transmission cost" the witness Lyon treated the entire transmission system as a unit, and as if it were one common conduit used by *all* the gas, and that he ignored the fact (1) that some laterals and metering stations and associated equipment are used exclusively in making direct sales to industrial customers, or the unregulated business; (2) that some laterals, metering stations and associated equipment are used exclusively in resale or regulated business; and (3) that the balance of the property is used in common *in varying degrees* by the regulated and unregulated business. Even in respect to the commonly used property he wholly ignored that the 20-inch diameter line north of Pueblo (as compared to the 22-inch diameter line south of Pueblo) is used almost exclusively by the regulated business. (R. V. 5, pp. 2427-2431.) These facts so ignored are also graphically represented on the Commission's own exhibit, 138, included as Appendix B to this brief.

Lyon's attention was directed to the fact that on this flow diagram map of the Commission it appeared that of the 21,594,112 Mcf of gas that was passed through the Bivins Station in 1939, 7,257,379 Mcf was sold directly to the C. F. & I. at Pueblo, and 1,676,091 Mcf was sold directly to Colorado Portland Cement, slightly north of Pueblo, and neither sale made any use whatever of the 105 miles of the 20-inch line north of those direct sale laterals.* Despite

*On the basis of use, the Company's engineer Rhodes assigned 99.48 per cent of this 20-inch line north of the Devine Station (Pueblo) to the resale or regulated business. (R. V. 4, p. 2271.)

these facts, Lyon went ahead and treated all of the transmission system, beginning with and including Canadian's Bivins compressor station in the field, and its transmission lines from that point in Texas, *together with all laterals used in making intrastate deliveries in Texas,* all of Colorado Interstate's transmission line to Denver, with all of its laterals, some of which, as just stated, were used exclusively in delivering direct sale gas, as a unit or common conduit and as if all the gas went in at the Bivins compressor, traversed the whole system, and came out at one common vent at the Denver city gate. (R. V. 5, pp. 2427-2431.) He admitted that in computing his "volumetric cost," a component of his total transmission cost, he so considered the system, and he gave no consideration to different segments of the line or the varying uses of the line in the regulated and unregulated business.

"Q. So that as I say, the result of your method is to tend to increase your computed cost of gas that this pipe line sells to these industries for consumption and to correspondingly reduce that that goes all the way through the line and comes out at Denver?

"A. I give no consideration as to whether the delivery is made to an industry or to a distribution plant or if it is resale gas or direct consumption. It is a factor, of course, under the method you have outlined that the farther the gas flows the more costs there are to accumulate. Under the method I have followed the geographical distribution of the load within that common cost zone is of no consequence." (R. V. 5; pp. 2429-2431.)

Under cross examination, he admitted that his method treats the 7,257,379 Mcf delivered to C. F. & I., the 1,676,091 Mcf delivered to Colorado Portland Cement, the 427,169 Mcf delivered to the Atchison, T. & S. F. Ry. Co., the 332,998 Mcf delivered to the American Crystal Sugar Company, and the other smaller deliveries to direct sale industrial customers in the Arkansas Valley, as if it used the Devine compressor station, and as if it used the 105-mile 20-inch diameter line northward to Denver, when in fact none of this direct sale gas ever used any part of that system. The necessary result of his treating the whole transmission system as a unit is wholly to

disregard the actual use of the property as between the regulated and unregulated business, and to "pile on" to this unregulated business large costs (included in his average cost), which the Company never incurred in the delivery of this unregulated gas. This method misstates the true cost which actually was incurred in delivering the regulated gas, particularly to Denver. (R. V. 5, pp. 2425, 2431, 2448.) See also the Commission's flow map, Appendix B to this brief. This fantastic ignoring of facts, of course, produced apparent, but not real, excess revenues from the regulated business, which the Commission used as an excuse for reducing the rates being charged for such sales.

In the fourth place, we know that as a part of such "costs" Lyon allowed and included a 6 per cent return (R. V. 5, p. 2409), which the Commission, however, in its Opinion increased to 6½ per cent (R. V. 1, p. 173) upon *all* of the property, including that used in the unregulated business as well as that in the regulated business. The effect of this was, of course, to derive a total cost, including such allowance for a "fair return" upon all the business, regulated *and unregulated,* which they then compared to the total revenues of the Company from all its business, regulated and unregulated, and thereby derived an "excess revenue" for the entire business. Whenever, in fact, a company is making a higher return on its unregulated business than is prescribed for the regulated, then this method of the Commission, whereby the limited return is first applied to *all of the property* in order to derive excess revenue from the whole business, operates to appropriate to the entire business the "excess" earnings from the unregulated part. Such method produces apparent "excess" earnings for the combined regulated and unregulated business. The Commission, in the instant case, purports to find that of such total earnings in excess of 6½ per cent on the *combined* business and property, $131,000 of such "excess" (R. V. 1, p. 172) is allocable to the unregulated business. The Commission disclaims any right to order any reduction in prices for the unregulated business that would reflect a reduction of this $131,000; *but the Commission overlooks the fact that there still lies concealed in the amount of reduction ordered for the regulated business "excess" earn-*

ings due to the imposition of this limitation of 6½ per cent on the whole business, regulated and unregulated. In another case, if the unregulated business was in fact being operated at less than 6½ per cent return on the property devoted to that business, or at a deficit, the Commission's method would in that case operate to appropriate excess earnings to the unregulated business, and thus obscure and conceal the true excess earnings on the regulated business.

The only way to assure that the regulated and unregulated business each "pays its own way" is to make a division of the property and expenses, as this Court has directed, and allow to the regulated business a fair return on the property so separated and allocated to it.

Lyon not only thus erroneously limited the return to petitioner upon property *exclusively* employed in unregulated business, but he imposed the same erroneous limitation of return upon an improper part or allocable portion of the jointly used property. This error will become more apparent hereinafter when we discuss the other errors committed by him in the allocation of "transmission costs." (R. V. 4, pp. 2333, line 25.) For the moment it is sufficient to point out that he divided his "transmission costs" into "volumetric costs" and "capacity costs." His "volumetric costs" have no relation to the property required for meeting the *maximum demands of the regulated business.* He included as a part of his total "transmission costs" a 6 per cent return on the property (which the Commission later increased to 6½ per cent), but he included only 50 per cent of such return in the "capacity cost" component of his "transmission costs." (R. V. 4, p. 2333, line 25.) In thus ignoring the true maximum demands of the regulated business, he departed completely from the requirements of a fair return on the *property* devoted to the public service. As a result of this device, costs that are truly assignable to the regulated business are shifted to the unregulated.

Even in those cases where the regulatory body has jurisdiction over all sales, and there is no combination of regulated and unregulated business, but only the problem of assigning costs as between several communities or regulated customers, the method used by Lyon has to hold that all

the return should be assigned to the capacity or demand costs. In *Arkansas-Louisiana Gas Company v. The City of Texarkana*, 96 Fed. (2d) 179, where the term "demand costs" is used synonymously with "capacity costs," the Circuit Court states:

> "The demand costs include the operation and maintenance and general expense of the transmission pipe lines and compressor stations, depreciation on same, taxes, *the return on the value of the transmission system, together with the Federal and State income taxes on such return,* and the return on such part of working capital and going value as is properly apportioned to the value of the Transmission property." (Emphasis supplied.)

This arbitrary assignment of only 50 per cent of the return to the "capacity cost" component of the "transmission costs" magnifies the error inherent in the failure to separate the property devoted to the public service, and the computation of a proper return thereon separately considered.

In the fifth place, we know that in figuring hi transmission costs he gave no consideration to the fact that gas delivered to some customers had to be compressed more times and at greater expense than that delivered to other customers. His attention was again directed to the flow map (Appendix B to this brief), and the following colloquy took place:

> "Q. I want to ask you with reference to this Exhibit No. 138 which was prepared by Mr. O'Connor, the flow chart showing where the gas comes in where it goes out—you are familiar with that?
>
> "A. Yes, that is Mr. O'Connor's map.
>
> "Q. Here is the delivery, say at Dalhart, Texas, which is a few miles away from Bivins. For every thousand cubic feet which is taken out of the line at Dalhart you apply that volumetric factor of three cents plus?
>
> "A. Yes, I have.
>
> "Q. So that for every thousand cubic feet of gas taken out at Denver you would again apply that three cents?

"'A. That is correct.'' (R. V. 5, p. 2425.)

• • • • •

"Q. The fact that the gas going to Denver is compressed four times doesn't result in any greater charge against the gas delivered at Denver under your method than the gas that is compressed only once?

"A. That is correct.'' (R. V. 5, p. 2448.)

In the sixth place, we know that Lyon, in figuring his "capacity cost" component of his total transmission cost, ignored the obligation of petitioner to meet the peak load demands for the domestic gas that will occur on the coldest expected days, and that he arbitrarily took the deliveries of regulated and unregulated gas as they happened to occur on February 9, 1939, which he called the "system peak day" for that particular year. (R. V. 5, pp. 2434-2436; R. V. 4, p. 2319.)

The transmission cost, as allocated by him, was in part on a volumetric or average basis, which he called the "volumetric cost" component of his "transmission costs," and, as he candidly stated, he gave no effect to priority. In respect to his "capacity cost" component of his total transmission cost, he did depart from average or volume costs to the extent of separating such costs, *not upon the basis of a property separation, nor upon the basis of priority, demand during the coldest weather to be expected,* but on the basis of deliveries to the regulated and unregulated business which happened to occur on his selected day. On the day selected by him the minimum temperature as shown by the Bulletin "U. S. Department of Commerce Weather Bureau, Monthly Meteorological Summary, Denver, Colorado, February, 1939" was minus 2, and the mean temperature for the day was 8° Fahrenheit above zero. Out of all the years of operation from 1928 to 1939, inclusive, he took the warmest winter, 1939, save one, 1934, in the whole history of operations. He ignored, for example, that on February 8, 1936, the temperature in the Denver area was 25° below zero, and that in 1930 it was minus 20, and that the lowest *mean temperature* has reached minus 10 in 1933 and 1937, according to "U. S. Department of Commerce Weather Bureau, Annual Meteorological Summary, with Comparative Data, 1941, Denver, Colorado."

Rhodes, in his separation exhibit, studied the weather conditions during the whole history of the line, and, from actual conditions which had obtained during that period, showed that a 1 degree drop for one day in the temperature below 65° Fahrenheit, that is, a 1 degree day deficiency in temperature, increased the load of resale domestic gas by 660,000 cubic feet per day. (R. V. 2, pp. 1110, 1111.) He then showed that on the basis of the following temperatures that *had occurred*, the domestic load would be as follows:

	Mean Temperature On Coldest Day (Deg. F.)	Estimated Domestic Load On Such a Day (Cu. Ft.)
(a) Denver Area	−14 deg.	42,157,000
(b) Colorado-Wyoming Area	−20	10,775,000
(c) Colorado Springs Area	−16	3,251,000
(d) Pueblo Area	−10	2,230,000
(e) Arkansas Valley Area	−10	1,304,000
(f) New Mexico Area	− 6	531,000
(g) Texas Area	− 6	1,483,000
Total	−14.5 deg.	61,731,000

(R. V. 2, p. 1111.)

Lyon in his testimony stated that on his selected day of February 9, 1939, deliveries of resale gas at the Denver gate were 36,104 Mcf. This is to be compared with deliveries of 42,157 Mcf required when the mean temperature reaches 14° below zero. (R. V. 2, p. 1111.)

In his treatment of "capacity costs," the witness Lyon treated all industrial gas in one group, making no separation between that sold directly (unregulated) and that sold for resale (regulated). Then in spreading the "capacity costs" among the industrial gas deliveries, he used the individual maximum delivery whenever it occurred (R. V. 4, pp. 2319, col. 10; 2384), rather than the quantity delivered on the system's maximum day. R. V. 4, p. 2319, col. 9.) This also served to reduce the costs assigned to the resale industrial gas.

On the day selected, i.e., February 9, 1939, for the pur-

pose of allocating "capacity costs," the mean temperature was 8 degrees above zero, far above the temperatures commonly experienced in the area, and to be expected in the future. The use of such day, therefore, was not representative. The undisputed testimony of petitioner already summarized showed that on January 24, 1940, when the mean temperature was only 1.5 degrees below zero, the regulated or resale gas amounted to 67,783 Mcf, and the unregulated gas was 47,343 Mcf. (R. V. 4, p. 2268.) This undisputed evidence also showed that by employing the factor derived from a study of the actual operation of the line during its whole history such actual peak day demands on any day could be translated into the relative demands that would exist on colder days. For example: when the mean temperature is 15 degrees below zero, then the regulated gas load would be 79,385 Mcf and the unregulated gas load 47,343 Mcf (R. V. 4, p. 2269), which represent the obligation of petitioner toward the respective classes of gas.

An exact comparison between the maximum obligation of petitioner with the testimony of Lyon is not possible because of the failure of Lyon to separate the resale gas from the direct sale gas. (R. V. 4, p. 2319, col. 8.) However, had Lyon apportioned his "capacity costs" on the basis of the relative load of regulated and unregulated gas on low temperature days actually experienced in the past operation of the line, a much larger percentage of such "capacity cost" component of the transmission cost would be assigned to the regulated business. We submit that the testimony of this Commission witness, Lyon, indicates that he set out deliberately to find one day in the seven and one-half year history of the Company's operation, which was far from the coldest day, but which, because of the relative low domestic load, would assign costs to the unregulated business. Such calculated testimony not only ignores the facts of nature and the evidence established in this record, but is palpably unfair.

The resale domestic customers, under the priority provisions of all contracts, are entitled to gas on the coldest expected day, and not on a day when the mean temperature is 8° above zero. The colder it is the more imperative is their demand, and their right to be served first. Yet Lyon

and the Commission would, in figuring this capacity cost component of transmission cost, make an allocation of cost as between the regulated and the unregulated business based on mere coincident deliveries on a day when the mean temperature was plus 8. Such action not only ignores realities, but is purely arbitrary and inexcusable.

Finally, we know that the Commission's method in its over-all effect produces results which are on their face arbitrary, unreasonable and inconsistent. In its announced costs for Colorado Interstate's customers (R. V. 1, p. 181), we find, for example, such cost to Citizens Utilities Company, at the city gate of La Junta, to be 24.3 cents per Mcf, whereas, the cost of delivering gas to Public Service Company at the city gate of Denver is only 15.4 cents per Mcf, despite the fact that such Denver gas has to be compressed once more than La Junta gas, and is transported approximately 145 miles farther than such La Junta gas. In arriving at such preposterous results, can it be said that the Commission is carrying out the statutory mandate and fixing a reasonable rate at each point? Their method wholly ignores the great disparity in the expense involved and the property devoted to the two services. Apparently the Commission, since deciding our case in March, 1942, has itself entertained some misgivings about the correctness of any such method, for in its decision No. 90, in Dockets Nos. G-133, 148, 157, 193 and 462, involving the rates of the *In Re United Gas Pipe Line Company*, handed down April 20, 1943, 48 PUR (NS) 91, 95, the Commission pointed out that there was considerable difference in the rates at the several city gates, and said:

> "This lower rate is due solely to the very close proximity of each of these areas to the sources of natural gas."

Each and all of the above specified errors in the Commission's allocation of costs directly operate to violate the jurisdictional limitations of the Natural Gas Act and to shift the cost from the regulated to the unregulated business, and, correspondingly, to inflate the apparent earnings from the regulated business. In *Smith v. Illinois Bell Telephone Co.*, supra, this Court stated:

resale to these communities in 1939, such sales constituting about eight-tenths of 1% of Canadian's 1939 sales (R. IV, 2319). Although petitioners allege that the Commission discriminated against these communities, they did not present any allocation showing the cost of rendering this service.[*] Therefore, the Commission staff's allocation is the only evidence in the record separating the cost of service for such intrastate sales. As the Commission commented in its opinion, "Nowhere in the entire evidence submitted by Canadian and Colorado Companies is there a complete presentation of the entire operations of the company broken down between jurisdictional and non-jurisdictional operations" (R. I, 175).

There is therefore no support in the record for petitioners' contention that the method employed by the Commission in allocating average transmission line costs to Dalhart, Hartley and Texline was improper or unfair. As above stated, the Denver pipe line would not have been built and the various communities along the route of the line would not be receiving the benefits of natural-gas service from the project were it not for the existence of the large markets at the end of the line in the vicinity of Denver. As the Commission engi-

[*] Petitioners' exhibits do not show the separate cost of these intrastate sales (Exh. 317; Tr. 24,332–38; Exh. 318, Tr. 24,351–58).

neer testified, it is not unreasonable to require all customers within a common "cost zone" to share equally in the cost of service from an integrated transmission line (R. IV, 2398). Cf. *Banton* v. *Belt Line Ry.*, 268 U. S. 413. Use of average costs in allocating transmission costs to customers served from a large integrated electric system has received the sanction of this Court. *Wabash Valley Electric Co.* v. *Young*, 287 U. S. 488, 499.

Canadian's contention that the Commission unfairly burdened its intrastate business by using the "average cost" method (Can. Br. 77–81) is refuted by the record. All of Canadian's intrastate sales are made to Amarillo Oil Company, principally at the wellhead in Texas, such sales constituting approximately 11% of Canadian's total annual sales volume (R. IV, 2319).[39] The revenues from these intrastate sales amounted to $205,000. The Commission assigned only $152,000 of costs to such sales, including a 6½% return, and found that Canadian is earning $53,000 in excess of a 6½% return on its intrastate business (R. I, 176). The Commission of course did not undertake to regulate such intrastate sales, and accordingly Canadian can retain the entire $53,000 of excess profit derived therefrom. There-

[39] Canadian's total intrastate sales to Amarillo Oil Company in 1939 amounted to 5,188,486 Mcf, of which 4,809,758 Mcf were sold at the wellhead and 378,912 Mcf were sold off the Denver line for resale to the towns of Dalhart, Hartley and Texline, Texas (R. IV, 2319).

fore the impact of the Commission's order could hardly be said to constitute an undue burden on Canadian's intrastate business.

Colorado Interstate further contends that the Commission's action was arbitrary in assigning 50% of the return to the "capacity cost" component of the "transmission costs" and 50% to the "volumetric cost" component (Col. Br. 48–49). The method used by the Commission is supported by substantial evidence and was reasonable (R. V, 2424–2425). If, as the Company contends, the entire return on the transmission facilities should be apportioned to "capacity costs" and none to "volumetric costs" absurd results would follow. Under such method, a direct industrial customer taking substantial quantities of gas every day throughout the year except on the single peak day would not be charged with any of the return on the transmission line facilities. Thus, such industrial customer would to that extent obtain free transportation from the line for an entire year, although he makes substantial use of the line 364 days of the year.

3. *System Peak Day.*—Colorado Interstate also contends that the Commission "arbitrarily" allocated the "capacity cost" component of the transmission costs on the basis of deliveries on February 9, 1939, the system peak day for that particular year when the mean temperature was 8° Fahrenheit; that this was the warmest winter in

the whole history of operations, except for the winter of 1934; and that the Commission engineer "set out deliberately to find one day in the seven and one-half year history of the Company's operation, which was far from the coldest day, but which, because of the relatively low domestic load, would assign costs to the unregulated business" (Col. Br. 50–53). The Company urges that the Commission should have used either January 24, 1940, when the mean temperature was 1.5° below zero, or a hypothetical peak day which assumes deliveries on the basis of a mean temperature of 15° below zero (Col. Br. 51–52). However, the adoption of either contention would result in assessing more costs to the direct industrial customers than were assigned by the Commission.

The Commission used the deliveries on February 9, 1939, as the basis of allocating capacity costs because it was admittedly the day of system peak deliveries in the test year 1939 (R. V, 2434). Obviously, it was appropriate to stay within the test year in allocating 1939 costs. The total deliveries on February 9, 1939, were 94,998 Mcf, of which 35,425 Mcf, or 37%, was sold to direct industrial customers and 59,573 Mcf, or 63%, was sold to wholesale customers. Accordingly, the Commission allocated 37% of the capacity costs to the direct industrial customers and 63% to the wholesale customers (R. IV, 2319, 2317). On January 24, 1940, when the mean temperature was

1.5° below zero, the sales to direct industrial customers amounted to 47,343 Mcf, or 41%, and the sales to wholesale customers amounted to 67,783 Mcf, or 59% (Col. Br. 52). If, as the company urges, the Commission had used the deliveries on January 24, 1940, 41% instead of 37% of the capacity costs would have been assigned to the direct industrial customers. Similarly, the use of petitioners' calculated deliveries on their proposed hypothetical peak day, which assumes a 15° below zero mean temperature, would produce a more harmful result to petitioners than the use of the actual peak-day deliveries in 1939 adopted by the Commission. Petitioners' witness, Rhodes, testified that the "maximum day obligation ratio based on total peak-load obligations" for such hypothetical peak day would be 38.2% for the direct industrial customers and 61.8% for the wholesale customers (R. IV, 2269). Thus, the use of the hypothetical peak day would result in assigning 38.2% of the capacity costs to the direct industrial customers instead of the 37% assigned by the Commission.

Colorado Interstate's contention that the Commission's allocation results in discrimination between gas sold to Citizens Utilities Company for resale at La Junta, Colorado, and gas sold to Public Service Company for sale in the city of Denver (Col. Br. 53), is not well taken. The Commission did not prescribe specific rate schedules for these

sales nor for any other sales, but ordered a reduction in Colorado's interstate wholesale rates in the aggregate amount of $2,065,000 (R. I, 191). The further rate-making step of prescribing specific rate schedules for sales at the various delivery points is yet to be taken. See *Federal Power Commission* v. *Natural Gas Pipeline Co.*, 315 U. S. 575, 584–585.[40]

4. *Adequacy of Findings.*—Petitioners also contend (Col. Br. 38–41; Can. Br. 76) that the Com-

[40] It may be noted that the difference in the cost to serve Public Service Company of Colorado (Denver and environs) and Citizens Utilities Company (La Junta and seven other small communities) is not due to any erroneous determination of transmission costs, nor to a fallacious allocation method, as implied by Colorado, but is caused primarily by the difference in distribution costs. Sales to Public Service Company by Colorado were 49 times as great as to Citizens Utilities Company in 1939 (R. IV, 2319), and hence average distribution costs per Mcf incurred by Colorado Company in delivering gas to Denver and environs was only a fraction of the average distribution cost per Mcf incurred in delivering gas to Citizens Utilities Company for resale at La Junta and seven other small communities. Reference to the staff engineer's exhibit (R. IV, 2317) and to Appendix B, Schedule 4, of this brief shows that the Commission found that distribution costs incurred in serving Public Service Company of Colorado were $38,412 or 0.6¢ per Mcf sold to that company. Distribution costs in serving Citizens Utilities Company were $16,861 or 9.3¢ per Mcf. Therefore, excluding distribution costs, the cost of serving Public Service Company of Colorado averaged 14.8¢ per Mcf and the cost to serve Citizens Utilities Company was 15.0¢ per Mcf, or the two costs were the same for practical purposes.

mission failed to make appropriate findings with respect to its allocation. However, Canadian admits (Can. Br. 81) that "it is clear from the Commission's opinion that it had adopted the allocation methods and principles of Commission witnesses and * * * base[d] its rate reduction order thereon." As appears from its opinion (R. I, 174–177) the Commission adopted the method presented by its staff engineer but used its revised and higher total cost of service in the allocation (R. I, 176). The application of the staff's allocation to such total cost of service was merely a mathematical calculation (See Appendix B, *infra*).[41]

We accordingly submit that the allocation made by the Commission is based upon competent evidence and has a rational basis. Neither the Act nor the Constitution requires more.

---

[41] That petitioners clearly understand how the final figures were derived is apparent from Canadian's brief (pp. 81–82) where it states that the source of the cost-of-service figure of $1,575,000 for gas sold by Canadian to Colorado in the Commission's opinion is "self-evident." As stated in Canadian's brief (p. 82), the method followed by the Commission in arriving at the separate cost of service for gas sold by Canadian to Colorado was to deduct from Canadian's total actual costs ($1,770,000) the allocated cost of service to all Canadian's customers except Colorado ($195,000), thereby securing the cost of service of gas to Colorado ($1,575,000) (R. I, 176).

V

ALL OF CANADIAN'S SALES TO COLORADO INTERSTATE, BEING SALES FOR RESALE IN INTERSTATE COMMERCE, ARE SUBJECT TO REGULATION BY THE COMMISSION

Canadian contends (Br. 83–87) that the Commission, in regulating the rate charged by Canadian for *all* the gas sold to Colorado Interstate, exceeded its jurisdiction under the Act, adverting to the fact that approximately one-half of such gas is sold by Colorado Interstate directly to industrial customers. Since the Commission cannot prescribe the rates which Colorado Interstate charges such direct industrial customers, Canadian contends that the Commission has no jurisdiction to regulate Canadian's charges to Colorado Interstate for such gas and that the ordered reduction in Canadian's rate to Colorado Interstate, to that extent, constituted "a foolish and vain exercise of rate regulatory jurisdiction" (Can. Br. 87). We submit that these contentions lack merit.

As the provisions of the Act and its legislative history make clear, all of the gas which Canadian sells to Colorado Interstate is sold to Colorado Interstate for resale by the latter and is therefore subject to the Commission's jurisdiction under the Act. Section 1 (b) of the Act specifically provides that the provisions of the Act "shall apply

to the transportation of natural gas in interstate commerce, to the sale in interstate commerce of natural gas for resale for ultimate public consumption for domestic, commercial, industrial, or any other use * * *." Accordingly, by the express terms of the statute, all of the gas sold by Canadian to Colorado, including that sold for resale "for industrial" use, is subject to rate regulation by the Commission.

Any ambiguity by reason of the reference in Section 1 (b) to resale "for ultimate public consumption" is resolved by an examination of the legislative history. As originally introduced, the bill (H. R. 4008, 75th Cong., 1st Sess.) which as amended (H. R. 6586, 75th Cong., 1st Sess.) became the Natural Gas Act, contained the following language in Section 1 (b):

> "(b) The provisions of this Act shall apply to the transportation of natural gas in interstate commerce, to the sale of such natural gas for resale *to the public*, and to natural-gas companies engaged in such transportation or sale, but shall not apply to the local distribution of natural gas or to the facilities used for such distribution or to the production or gathering of natural gas: *Provided*, That nothing in this Act shall be construed to authorize the Commission to fix the rates or charges to the public

> for the sale of natural gas distributed locally or for the sale of natural gas for industrial use only." [Emphasis supplied.]

In the hearings before the House Committee on Interstate and Foreign Commerce with respect to H. R. 4008, Mr. John E. Benton, the General Solicitor of the National Association of Railroad and Utility Commissioners, suggested among other amendments that the phrase "to the public" be deleted from Section 1 (b). He explained that the purpose of this amendment was (Hearings, pp. 21–22):

> "* * * to make certain that the bill will apply to all intercompany sales of natural gas at wholesale, even though the sale be from one company to another company which will resell to another corporation before the gas is finally sold to the public."

Later in the hearings, Mr. William A. Dougherty (see pp. 25–26, *supra*) proposed an amendment to Section 1 (b), to add at the end of the section: "or for resale for industrial use only" (Hearings, pp. 123–124). The obvious purpose of this suggestion, as explained by Mr. Dougherty (Hearings, p. 125), was to exclude "the gas that the pipe line sells to the distributing company for resale for industrial purposes," and "to make clear that all gas that ultimately goes to industrial customers, purchased under the separate rate or a separate contract, for that pur-

pose is not within the provisions of this legislation."[42]

With reference to Mr. Benton's proposal to delete the words "to the public" from Section 1 (b), Mr. Dougherty stated that while he realized the reasons for Mr. Benton's amendment, he felt that the Committee should consider inserting the words "for ultimate public consumption" in lieu of the words "to the public". Mr. Dougherty stated that the reason for his suggestion in this regard was (Hearings, p. 130):

> "So that it is clear even though there *your* [are] successive sales of gas, all of which are subject to the Commission's jurisdiction, that the gas ultimately must be distributed for general public consumption before there is any right to fix the rates, so that we get no problem of indirect industrial sales that might perchance on their face be under this Commission's jurisdiction."

In objecting to this amendment suggested by Mr. Dougherty, Mr. Benton by letter to the Committee of March 29, 1937, suggested the lan-

---

[42] In response to an inquiry from Representative Martin, Mr. Dougherty stated that there was "a considerable volume of that character of resale" and that "most of it" is sold in that way. By way of example, Mr. Dougherty stated that Colorado Interstate Gas Company sells direct to Colorado Fuel & Iron Company, "a tremendously large consumer," but in Denver "all of the industries are sold gas by the local company, the gas being purchased from the pipe line company."

guage which was substantially adopted by the Committee, and in so doing Mr. Benton stated (Hearings, pp. 142–143):

> "Sales for industrial use ought not to be exempt from all regulation, for the result may very well be that unjustifiable discrimination will result, and there will be no commission to which complaint may be made. Sales for industrial uses plainly ought to be subject to regulation by the same Commission which regulates sales to other classes of consumers, so that just and reasonable rates, for the several classes of service, properly related to each other, may be established. Under the bill as drawn, all consumer sales are exempt from Federal regulation, and left to State regulation. The language of the suggested amendment just proposed leaves this purpose unaffected, and makes clear that the regulation of intercompany sales is designed for the protection of the consuming public, as a part of the complete regulation of the entire utility service."

It is thus clear from the legislative history that under Section 1 (b) all the gas which Canadian sells to Colorado Interstate, including that which Colorado Interstate sells directly to industrial customers, is subject to regulation by the Commission.

In its brief (p. 86) Canadian contends that since under the proviso in Section 4 (e) of the Act the Commission has no authority to suspend

the rates charged for the sale of natural gas "for resale for industrial use only," such rates are not subject to regulation by the Commission. However, if the Commission had no authority to regulate the rates charged for gas sold for resale for industrial use, the proviso in Section 4 (e) exempting such rates from the suspension power of the Commission would be meaningless, since the Commission's authority to suspend rates is limited to those rates which are subject to its jurisdiction. Moreover, all the gas which Canadian sells to Colorado Interstate is sold under a single rate without distinction between the gas which Colorado Interstate may sell directly to industrial customers and that which it sells to various distributing companies for resale. Accordingly there is only one rate between Canadian and Colorado Interstate, and it is not a rate covering the sale of gas for resale "for industrial use only."

Canadian also contends that since the Commission for purposes of allocation treated Canadian and Colorado Interstate as an integrated system, it should have limited its rate reduction to those rates over which it would have jurisdiction if Canadian and Colorado Interstate were in fact one company, in which event there would not be any sale or rate between Canadian and Colorado Interstate and the sales which the latter makes directly to industrial consumers, not being for resale, would not be subject to the Commission's

jurisdiction. While, as above stated, the Commission properly treated Canadian and Colorado Interstate as a unit for purposes of its allocation of cost of service, it does not follow that the Commission's rate order in respect of Canadian is invalid.

In considering the rationale and purposes of these proceedings, the matter should be approached from the standpoint of the ultimate consumer in the various cities, including Denver and Pueblo, which receive their supply of gas from this pipe line. The rates charged such consumers by the local distributing companies in those cities are subject to State regulation, but the reasonableness of such "burner tip" rates is principally dependent upon the price which the distributing company pays to Colorado Interstate for the gas at the city gates. The purchase price of the gas is claimed by the distributing company as an operating expense in any State proceeding involving the reasonableness of the retail rates and that price, being an interstate wholesale rate, cannot be regulated by the state commission (*Missouri* v. *Kansas Gas Co.*, 265 U. S. 298).

The instant proceedings were commenced when the City and County of Denver filed complaints with the Federal Power Commission alleging that the "gate" rates being charged the distributing company in that city by Colorado Interstate were unreasonable, and requesting the Commis-

sion to determine and fix the reasonable rate. Since the reasonableness of Colorado Interstate's city gate rates was in large part dependent upon the reasonableness and propriety of the price which Colorado Interstate pays to Canadian River for gas, the principal operating expense of Colorado Interstate, the Commission had to determine the reasonableness of the rate between Canadian and Colorado Interstate. The Commission, after hearing, determined that such rate was unreasonable to the extent of $551,000 and that therefore the amount claimed by Colorado Interstate as an operating expense for cost of purchased gas should be reduced to that extent in determining the reasonableness of Colorado Interstate's city gate rates.

The Commission under the statute accordingly required Canadian to reduce its charges to Colorado Interstate. It might be urged in this connection that the Commission could have merely disregarded the corporate entities and in fixing Colorado Interstate's rates reduced its claim for the cost of purchased gas to the extent of $551,000, without making any change in the rate being charged to Colorado Interstate by Canadian. However, this rate, being for the sale of gas in interstate commerce for resale, was embodied in a rate schedule filed by Canadian with the Commission as required by Section 4 of the Act, which prohibits a natural-gas company from charging

any rate for a sale subject to the Commission's jurisdiction except in accordance with a filed rate schedule.[43] Accordingly, unless and until the filed rate between Canadian and Colorado Interstate has been changed by order of the Commission or by the filing of a new rate schedule, Canadian would have to charge Colorado and Colorado would have to pay the original rate, including the excess of $551,000 which the Commission found to be unreasonable. To have limited the allowance in Colorado Interstate's operating expenses to what the Commission had determined to be a reasonable charge by Canadian for the gas sold to Colorado Interstate, without complying with the statutory requirements necessary to relieve Colorado Interstate from the obligation of paying the excess of $551,000 to Canadian, would probably have resulted in a direct confiscation in the case of Colorado Interstate to that extent. Moreover, under the Act it is the Commission's duty when it has found an existing rate to be unreasonable to require a reduction in such rate.

We therefore submit that the Commission did not exceed its jurisdiction when it required a reduction in the interstate wholesale rate being charged Colorado Interstate by Canadian to the extent found unreasonable.

---

[43] A violation of this section would carry the possibility of criminal and civil penalties.

CONCLUSION

For the reasons stated, it is respectfully submitted that the decision below should be affirmed.

CHARLES FAHY,
Solicitor General.

Assistant City Attorney.

For Wyoming Public Service Commission:
LOUIS J. O'MARR,
Attorney General, State of Wyoming.

JANUARY 1945.

APPENDIX A

The pertinent provisions of the Natural Gas Act of 1938, c. 556, 52 Stat. 821 (15 U. S. C. § 717 *et seq.*), as amended by the Act of February 7, 1942 (56 Stat. 83), are as follows:

SECTION 1. (a) As disclosed in reports of the Federal Trade Commission made pursuant to Senate Resolution 83 (Seventieth Congress, first session) and other reports made pursuant to the authority of Congress, it is hereby declared that the business of transporting and selling natural gas for ultimate distribution to the public is affected with a public interest, and that Federal regulation in matters relating to the transportation of natural gas and the sale thereof in interstate and foreign commerce is necessary in the public interest.

(b) The provisions of this act shall apply to the transportation of natural gas in interstate commerce, to the sale in interstate commerce of natural gas for resale for ultimate public consumption for domestic, commercial, industrial, or any other use, and to natural-gas companies engaged in such transportation or sale, but shall not apply to any other transportation or sale of natural gas or to the local distribution of natural gas or to the facilities used for such distribution or to the production or gathering of natural gas.

SEC. 4. (a) All rates and charges made, demanded, or received by any natural-gas company for or in connection with the transportation or sale of natural gas subject to the jurisdiction of the Commission, and all rules and regulations affecting or pertaining to such rates or charges, shall be just and reasonable, and any such rate or charge that is not just and reasonable is hereby declared to be unlawful.

(b) No natural-gas company shall, with respect to any transportation or sale of natural gas subject to the jurisdiction of the Commission, (1) make or grant any undue preference or advantage to any person or subject any person to any undue prejudice or disadvantage, or (2) maintain any unreasonable difference in rates, charges, service, facilities, or in any other respect, either as between localities or as between classes of service.

(c) Under such rules and regulations as the Commission may prescribe, every natural-gas company shall file with the Commission, within such time (not less than sixty days from the date this Act takes effect) and in such form as the Commission may designate, and shall keep open in convenient form and place for public inspection, schedules showing all rates and charges for any transportation or sale subject to the jurisdiction of the Commission, and the classifications, practices, and regulations affecting such rates and charges, together with all contracts which in any manner affect or relate to such rates, charges, classifications, and services.

(d) Unless the Commission otherwise orders, no change shall be made by any natural-gas company in any such rate,

charge, classification, or service, or in any rule, regulation, or contract relating thereto, except after thirty days' notice to the Commission and to the public. Such notice shall be given by filing with the Commission and keeping open for public inspection new schedules stating plainly the change or changes to be made in the schedule or schedules then in force and the time when the change or changes will go into effect. The Commission, for good cause shown, may allow changes to take effect without requiring the thirty days' notice herein provided for by an order specifying the changes so to be made and the time when they shall take effect and the manner in which they shall be filed and published.

(e) Whenever any such new schedule is filed the Commission shall have authority, either upon complaint of any State, municipality, or State commission, or upon its own initiative without complaint, at once, and if it so orders, without answer or formal pleading by the natural-gas company, but upon reasonable notice, to enter upon a hearing concerning the lawfulness of such rate, charge, classification, or service; and, pending such hearing and the decision thereon, the Commission, upon filing with such schedules and delivering to the natural-gas company affected thereby a statement in writing of its reasons for such suspension, may suspend the operation of such schedule and defer the use of such rate, charge, classification, or service, but not for a longer period than five months beyond the time when it would otherwise go into effect: *Provided*, That the Commission shall not have authority to suspend the rate, charge, classification, or service for the

sale of natural gas for resale for industrial use only; and after full hearings, either completed before or after the rate, charge, classification, or service goes into effect, the Commission may make such orders with reference thereto as would be proper in a proceeding initiated after it had become effective. If the proceeding has not been concluded and an order made at the expiration of the suspension period, on motion of the natural-gas company making the filing, the proposed change of rate, charge, classification, or service shall go into effect. Where increased rates or charges are thus made effective, the Commission may, by order, require the natural-gas company to furnish a bond, to be approved by the Commission, to refund any amounts ordered by the Commission, to keep accurate accounts in detail of all amounts received by reason of such increase, specifying by whom and in whose behalf such amounts were paid, and, upon completion of the hearing and decision, to order such natural-gas company to refund, with interest, the portion of such increased rates or charges by its decision found not justified. At any hearing involving a rate or charge sought to be increased, the burden of proof to show that the increased rate or charge is just and reasonable shall be upon the natural-gas company, and the Commission shall give to the hearing and decision of such questions preference over other questions pending before it and decide the same as speedily as possible.

SEC. 5. (a) Whenever the Commission, after a hearing had upon its own motion or upon complaint of any State, municipality, State commission, or gas distributing

company, shall find that any rate, charge, or classification demanded, observed, charged, or collected by any natural-gas company in connection with any transportation or sale of natural gas, subject to the jurisdiction of the Commission, or that any rule, regulation, practice, or contract affecting such rate, charge, or classification is unjust, unreasonable, unduly discriminatory, or preferential, the Commission shall determine the just and reasonable rate, charge, classification, rule, regulation, practice, or contract to be thereafter observed and in force, and shall fix the same by order: *Provided, however,* That the Commission shall have no power to order any increase in any rate contained in the currently effective schedule of such natural gas company on file with the Commission, unless such increase is in accordance with a new schedule filed by such natural gas company; but the Commission may order a decrease where existing rates are unjust, unduly discriminatory, preferential, otherwise unlawful, or are not the lowest reasonable rates.

(b) The Commission upon its own motion, or upon the request of any State commission, whenever it can do so without prejudice to the efficient and proper conduct of its affairs, may investigate and determine the cost of the production or transportation of natural gas by a natural-gas company in cases where the Commission has no authority to establish a rate governing the transportation or sale of such natural gas.

SEC. 6. (a) The Commission may investigate and ascertain the actual legitimate cost of the property of every natural-gas company, the depreciation therein, and, when found necessary for rate-making pur-

poses, other facts which bear on the determination of such cost or depreciation and the fair value of such property.

(b) Every natural-gas company upon request shall file with the Commission an inventory of all or any part of its property and a statement of the original cost thereof, and shall keep the Commission informed regarding the cost of all additions, betterments, extensions, and new construction.

SEC. 7. (c) No natural-gas company or person which will be a natural-gas company upon completion of any proposed construction or extension shall engage in the transportation or sale of natural gas, subject to the jurisdiction of the Commission, or undertake the construction or extension of any facilities therefor, or acquire or operate any such facilities or extensions thereof, unless there is in force with respect to such natural-gas company a certificate of public convenience and necessity issued by the Commission authorizing such acts or operations: *Provided, however,* That if any such natural-gas company or predecessor in interest was bona fide engaged in transportation or sale of natural gas, subject to the jurisdiction of the Commission, on the effective date of this amendatory Act, over the route or routes or within the area for which application is made, and has so operated since that time, the Commission shall issue such certificate without requiring further proof that public convenience and necessity will be served by such operation, and without further proceedings, if application for such certificate is made to the Commission within ninety days after the effective date of this amendatory Act. Pending the determination of

any such application, the continuance of such operation shall be lawful.

In all other cases the Commission shall set the matter for hearing and shall give such reasonable notice of the hearing thereon to all interested persons as in its judgment may be necessary under rules and regulations to be prescribed by the Commission; and the application shall be decided in accordance with the procedure provided in subsection (e) of this section and such certificate shall be issued or denied accordingly: *Provided, however,* That the Commission may issue a temporary certificate in cases of emergency, to assure maintenance of adequate service or to serve particular customers, without notice or hearing, pending the determination of an application for a certificate, and may by regulation exempt from the requirements of this section temporary acts or operations for which the issuance of a certificate will not be required in the public interest.

(e) Except in the cases governed by the provisos contained in subsection (c) of this section, a certificate shall be issued to any qualified applicant therefor, authorizing the whole or any part of the operation, sale, service, construction, extension, or acquisition covered by the application, if it is found that the applicant is able and willing properly to do the acts and to perform the service proposed and to conform to the provisions of the Act and the requirements, rules, and regulations of the Commission thereunder, and that the proposed service, sale, operation, construction, extension, or acquisition, to the extent authorized by the certificate, is or will be required by the present or future public con-

venience and necessity; otherwise such application shall be denied. The Commission shall have the power to attach to the issuance of the certificate and to the exercise of the rights granted thereunder such reasonable terms and conditions as the public convenience and necessity may require.

(f) The Commission, after a hearing had upon its own motion or upon application, may determine the service area to which each authorization under this section is to be limited. Within such service area as determined by the Commission a natural-gas company may enlarge or extend its facilities for the purpose of supplying increased market demands in such service area without further authorization.

(g) Nothing contained in this section shall be construed as a limitation upon the power of the Commission to grant certificates of public convenience and necessity for service of an area already being served by another natural-gas company.

SEC. 8. (a) Every natural-gas company shall make, keep, and preserve for such periods, such accounts, records of cost-accounting procedures, correspondence, memoranda, papers, books, and other records as the Commission may by rules and regulations prescribe as necessary or appropriate for purposes of the administration of this act: *Provided, however,* That nothing in this act shall relieve any such natural-gas company from keeping any accounts, memoranda, or records which such natural-gas company may be required to keep by or under authority of the laws of any State. The Commission may prescribe a system of accounts to be kept by such natural-gas companies, and may classify

such natural-gas companies and prescribe a system of accounts for each class. The Commission, after notice and opportunity for hearing, may determine by order the accounts in which particular outlays or receipts shall be entered, charged, or credited. The burden of proof to justify every accounting entry questioned by the Commission shall be on the person making, authorizing, or requiring such entry, and the Commission may suspend a charge or credit pending submission of satisfactory proof in support thereof.

(b) The Commission shall at all times have access to and the right to inspect and examine all accounts, records, and memoranda of natural-gas companies; and it shall be the duty of such natural-gas companies to furnish to the Commission, within such reasonable time as the Commission may order, any information with respect thereto which the Commission may by order require, including copies of maps, contracts, reports of engineers, and other data, records, and papers, and to grant to all agents of the Commission free access to its property and its accounts, records, and memoranda when requested so to do. No member, officer, or employee of the Commission shall divulge any fact or information which may come to his knowledge during the course of examination of books, records, data, or accounts, except insofar as he may be directed by the Commission or by a court.

(c) The books, accounts, memoranda, and records of any person who controls directly or indirectly a natural-gas company subject to the jurisdiction of the Commission and of any other company controlled

by such person, insofar as they relate to transactions with or the business of such natural-gas company, shall be subject to examination on the order of the Commission.

SEC. 9. (a) The Commission may, after hearing, require natural-gas companies to carry proper and adequate depreciation and amortization accounts in accordance with such rules, regulations, and forms of account as the Commission may prescribe. The Commission may from time to time ascertain and determine, and by order fix, the proper and adequate rates of depreciation and amortization of the several classes of property of each natural-gas company used or useful in the production, transportation, or sale of natural gas. Each natural-gas company shall conform its depreciation and amortization accounts to the rates so ascertained, determined, and fixed. No natural-gas company subject to the jurisdiction of the Commission shall charge to operating expenses any depreciation or amortization charges on classes of property other than those prescribed by the Commission, or charge with respect to any class of property a percentage of depreciation or amortization other than that prescribed therefor by the Commission. No such natural-gas company shall in any case include in any form under its operating or other expenses and depreciation, amortization, or other charge or expenditure included elsewhere as a depreciation or amortization charge or otherwise under its operating or other expenses. Nothing in this section shall limit the power of a State commission to determine in the exercise of its jurisdiction, with respect to any natural-gas company, the percentage rates of de-

preciation or amortization to be allowed, as to any class of property of such natural-gas company, or the composite depreciation or amortization rate, for the purpose of determining rates or charges.

(b) The Commission, before prescribing any rules or requirements as to accounts, records, or memoranda, or as to depreciation or amortization rates, shall notify each State commission having jurisdiction with respect to any natural-gas company involved and shall give reasonable opportunity to each such commission to present its views and shall receive and consider such views and recommendations.

SEC. 10. (a) Every natural-gas company shall file with the Commission such annual and other periodic or special reports as the Commission may by rules and regulations or order prescribe as necessary or appropriate to assist the Commission in the proper administration of this act. The Commission may prescribe the manner and form in which such reports shall be made, and require from such natural-gas companies specific answers to all questions upon which the Commission may need information. The Commission may require that such reports shall include, among other things, full information as to assets and liabilities, capitalization, investment and reduction thereof, gross receipts, interest due and paid, depreciation, amortization, and other reserves, cost of facilities, cost of maintenance and operation of facilities for the production, transportation, or sale of natural gas, cost of renewal and replacement of such facilities, transportation, delivery, use, and sale of natural gas. The Commission may require any such natural-gas company to make adequate provision

for currently determining such costs and other facts. Such reports shall be made under oath unless the Commission otherwise specifies.

(b) It shall be unlawful for any natural-gas company wilfully to hinder, delay, or obstruct the making, filing, or keeping of any information, document, report, memorandum, record, or account required to be made, filed, or kept under this act or any rule, regulation, or order thereunder.

SEC. 11. (a) In case two or more States propose to the Congress compacts dealing with the conservation, production, transportation, or distribution of natural gas it shall be the duty of the Commission to assemble pertinent information relative to the matters covered in any such proposed compact, to make public and to report to the Congress information so obtained, together with such recommendations for further legislation as may appear to be appropriate or necessary to carry out the purposes of such proposed compact and to aid in the conservation of natural-gas resources within the United States and in the orderly, equitable, and economic production, transportation, and distribution of natural gas.

(b) It shall be the duty of the Commission to assemble and keep current pertinent information relative to the effect and operation of any compact between two or more States heretofore or hereafter approved by the Congress, to make such information public, and to report to the Congress, from time to time, the information so obtained, together with such recommendations as may appear to be appropriate or necessary to promote the purposes of such compact.

SEC. 14. (b) The Commission may, after hearing, determine the adequacy or inadequacy of the gas reserves held or controlled by any natural-gas company, or by anyone on its behalf, including its owned or leased properties or royalty contracts; and may also, after hearing, determine the propriety and reasonableness of the inclusion in operating expenses, capital, or surplus of all delay rentals or other forms of rental or compensation for unoperated lands and leases. For the purpose of such determinations, the Commission may require any natural-gas company to file with the Commission true copies of all its lease and royalty agreements with respect to such gas reserves.

SEC. 16. The Commission shall have power to perform any and all acts, and to prescribe, issue, make, amend, and rescind such orders, rules, and regulations as it may find necessary or appropriate to carry out the provisions of this act. Among other things, such rules and regulations may define accounting, technical, and trade terms used in this act; and may prescribe the form or forms of all statements, declarations, applications, and reports to be filed with the Commission, the information which they shall contain, and the time within which they shall be filed. Unless a different date is specified therein, rules and regulations of the Commission shall be effective thirty days after publication in the manner which the Commission shall prescribe. Orders of the Commission shall be effective on the date and in the manner which the Commission shall prescribe. For the purposes of its rules and regulations, the Commission may classify persons and matters within its

jurisdiction and prescribe different requirements for different classes of persons or matters. All rules and regulations of the Commission shall be filed with its secretary and shall be kept open in convenient form for public inspection and examination during reasonable business hours.

SEC. 19. (a) Any person, State, municipality, or State commission aggrieved by an order issued by the Commission in a proceeding under this act to which such person, State, municipality, or State commission is a party may apply for a rehearing within thirty days after the issuance of such order. The application for rehearing shall set forth specifically the ground or grounds upon which such application is based. Upon such application the Commission shall have power to grant or deny rehearing or to abrogate or modify its order without further hearing. Unless the Commission acts upon the application for rehearing within thirty days after it is filed, such application may be deemed to have been denied. No proceeding to review any order of the Commission shall be brought by any person unless such person shall have made application to the Commission for a rehearing thereon.

(b) Any party to a proceeding under this act aggrieved by an order issued by the Commission in such proceeding may obtain a review of such order in the circuit court of appeals of the United States for any circuit wherein the natural-gas company to which the order relates is located or has its principal place of business, or in the United States Court of Appeals for the District of Columbia, by filing in such court, within sixty days after the order of the Commission upon the application for rehearing, a writ-

ten petition praying that the order of the Commission be modified or set aside in whole or in part. A copy of such petition shall forthwith be served upon any member of the Commission and thereupon the Commission shall certify and file with the court a transcript of the record upon which the order complained of was entered. Upon the filing of such transcript such court shall have exclusive jurisdiction to affirm, modify, or set aside such order in whole or in part. No objection to the order of the Commission shall be considered by the court unless such objection shall have been urged before the Commission in the application for rehearing unless there is reasonable ground for failure so to do. The finding of the Commission as to the facts, if supported by substantial evidence, shall be conclusive. If any party shall apply to the court for leave to adduce additional evidence, and shall show to the satisfaction of the court that such additional evidence is material and that there were reasonable grounds for failure to adduce such evidence in the proceedings before the Commission, the court may order such additional evidence to be taken before the Commission and to be adduced upon the hearing in such manner and upon such terms and conditions as to the court may seem proper. The Commission may modify its findings as to the facts by reason of the additional evidence so taken, and it shall file with the court such modified or new findings, which if supported by substantial evidence, shall be conclusive, and its recommendation, if any, for the modification or setting aside of the original order. The judgment and decree of the court, affirming, modifying, or setting

aside, in whole or in part, any such order of the Commission, shall be final, subject to review by the Supreme Court of the United States upon certiorari or certification as provided in sections 239 and 240 of the Judicial Code, as amended (U. S. C., title 28, secs. 346 and 347).

(c) The filing of an application for rehearing under subsection (a) shall not, unless specifically ordered by the Commission, operate as a stay of the Commission's order. The commencement of proceedings under subsection (b) of this section shall not, unless specifically ordered by the court, operate as a stay of the Commission's order.

SCHEDULE 1

Canadian River Gas Company
Adjustments Made by Commission in Staff's Cost of Service (Exh. 226)
and Allocation Thereof to Functional Divisions

Line	Description (1)	Amount (2)	Classification (3)	Adjustments Allocated to Functional Divisions: Cost of Gas At Well-head (4)	Gathering (5)	Residuals Refining Cost (6)	Transmission Cost Volumetric (7)	Transmission Cost Capacity (8)
1	Additional Expenses Allowed							
2	Production Expense	$ 11,722	Residuals	$ -	$	$ 11,722	$ -	$ -
3	General Expense (Rate Case Expense)	1/ 41,000	General	19,569	1,410	4,174	-	15,847
4	Depreciation of General Plant	2/ 3,787	"	2,034	471	108	-	1,174
5	Depletion	36,104	Well-head	36,104		-	-	-
6	Federal Capital Stock Tax	2/ 2,021	General	1,086	251	57	-	627
7	Delay Rentals	(6,614)	Well-head	(6,614)		-	-	-
8	Total Additional Expenses	$ 88,020		$ 52,179	$	$ 16,061	-	$17,648
9	Additional Return on Rate Base Allowed							
10	Leaseholds and Well Facilities	$ 67,473	Well-head	$ 67,473	$	$ -	$ -	$ -
11	Gathering Facilities	6,496	Gathering	-		-	-	-
12	Gasoline Plant	1,481	Residuals	-		1,481	-	-
13	Transmission Plant	33,065	Transmission	-		-	16,532	16,533
14	General and Undistributed Plant	2/ 10,289	General	5,527		292	1,595	1,595
15	Total Additional Return	$118,804		$ 73,000	$	$ 1,773	$18,127	$18,128
16	Total Additional Cost of Service Allowed	$206,824		$125,179	$	$ 17,834	$18,127	$35,776

1/ Allocation of Administrative and General Expenses

First Allocation: Between Production and Transmission on basis of total direct expenses.

	Direct Expenses	%
Production (exclud. residuals credit)	$510,984.60	61.35
Transmission	321,869.98	38.65
Total	$832,854.58	100.00

Second Allocation: Allocation of Production Portion to Well-head, Gathering and Residuals on basis of operation and maintenance expenses, Tables 5, 6 and 7 of Exh. 226.

	Basis	%
Well-head	$391,153.40	77.8
Gathering	28,012.89	5.6
Residuals Refining	83,570.90	16.6
Total	$502,737.19	100.0

Composite Result of Both Allocations

Well-head	77.8 x 61.35 =	47.73%
Gathering	5.6 x 61.35 =	3.44
Residuals	16.6 x 61.35 =	10.18
Subtotal		61.35
Transmission		38.65
Total		100.00%

Administrative & General Expense So Allocated
Rate Case Expense $41,000

Well-head	$19,569
Gathering	1,410
Residuals	4,174
Subtotal	$25,153
Transmission	15,847
Total	$41,000

2/ Allocation of General and Undistributed Plant Expenses

Basis: Net Book Cost of Plant in Service 12/31/59

	Basis	%	Depreciation of Gen. and Undistr. Plant	Federal Capital Stock Tax	Return on General and Undistr. Plant
Well-head(Leases,Wells,etc.)	$4,496,351	55.72	$ 2,034	$ 1,086	$ 5,367
Gathering	1,041,004	12.44	471	251	1,230
Residuals	237,224	2.84	108	57	282
Subtotal	$5,774,579	69.00	$ 2,613	$ 1,394	$ 6,879
Transmission	2,595,027	31.00	1,174	627	3,190
Total	$8,369,606	100.00	$ 3,787	$ 2,021	$10,289

APPENDIX B (CONTINUED)

SCHEDULE 2

Colorado Interstate Gas Company
Adjustments Made by Commission in Staff's Cost of Service (Exh.226)
Allocation Thereof to Functional Divisions

Line	Description (1)	Amount (2)	Classification (3)	Adjustments as Allocated to Functional Divisions: Transmission Costs Volumetric (4)	Transmission Costs Capacity (5)	Distribution Costs (6)
1	Additional Expenses:					
2	Rate Case Expense	1/ 43,000	General		$ 36,249	$ 6,751
3	Other General Expense	1/ 887	General		748	139
4	Transmission Maintenance	7,360	Transmission		7,360	
5	Transmission Maintenance	(668)	Transmission		(668)	
6	Depreciation of Trans.Plant	368	Transmission		368	
7	Depreciation of General Plant	2/ 1,552	General		1,531	21
8	Amortization	1/ 13,890	General		11,709	2,181
9	Federal Capital Stock Tax	2/ 22,694	General		22,383	311
10	Total additional exp.	$89,083			$79,680	$9,403
11	Additional Return on Rate Base Allowed:					
12	Transmission Plant	$ 59,172	Transmission	$29,5	$29,586	
13	Distribution Plant	544	Distribution			$ 544
14	General Plant	2/ 13,722	General	6,7	6,767	188
15	Total Additional Return	$ 73,438		$36,3	$36,353	$ 732
16	Total Additional Cost of Service Allowed	$162,521		$36,3	$116,033	$10,135

1/ These additional costs are allocated between transmission and distribution on basis of Colorado's transmission and distribution expenses, as shown in Exhibit 140, p. 103, line 23, col. 5 ($277,246) and p. 104, line 37, col. 5 ($50,992).

2/ These items allocated on basis of net plant in service December 31, 1939 in accordance with method employed in Exhibit 226.

The allocations between volumetric and capacity costs follow the method used in Exhibit 226.

1/ MCF in Column 2 are volumes of gas at pressure of 14.65 pounds per square inch gilute.

2/ Adjustments in Columns 4 to 9 were assigned to each customer in accordance with peedure used in preparation of staff exhibit (Exh.226). Adjustments in Column 10 were assigned in proportion to distribution plant investment as of December 31, 1939, used to serve each customer.

3/ Figures for Arkansas Val sy Natural Gas Company cover its service to Fountain Valley School only, because its remaining properties were sold to Citizens Utilities Company. Costs for the latter company include services communities formerly served by Arkansas Valley Natural Gas Company.

4/ Commission made one finding as to the combined total cost of serving Amarillo Oil company from Denver Pipe Line and at well-head. Finding is shown on line 26, col. 13.

APPENDIX C

Tabulation showing number of hs natural gas deliveries to customers of Canadian and Colorado Companies were comtely interrupted or partially reduced during the period from the beginning of sdse to each customer to December 31, 1940
(R Ex. 290; R. II, 1025-29)

Customers affected (1)	Complete interruption of all deliveries (Hours) (2)	Partial iuction in delivies for industriqurposes: Due to physical causes (Hours) (3)	Due to high Demand (Hours) (4)	Total hours (2) (3) (4) (5)	Total period of service to December 31, 1940: Years (6)	Hours (7)	Percentage of time service was interrupted or reduced from all causes (8)	Percentage of total time, full and complete service was supplied (9)
Resale customers:								
Amarillo Oil Co.	43	0	0	43	12-1/2	109,500	0.04	99.96
Arkansas Valley Natural Gas Co.	12*	0	0	12	11	96,400	0.01	99.99
Citizens Utilities Co.	10*	0	0	10	11-3/4	102,900	0.01	99.99
Pueblo Gas and Fuel Co.	4-1/2*	15	0	19-1/2	12-1/2	109,500	0.02	99.98
City of Colorado Springs	9*	54	29	92	9-1/4	81,000	0.11	99.89
Public Service Company of Colorado	49	170	8	227	12-1/2	109,500	0.21	99.79
Colorado-Wyoming Gas Co.	38	109	30	177	11-1/4	98,600	0.18	99.82
Direct customers:								
American Crystal Sugar Co.	10*	0	0	10	11-1/4	98,600	0.01	99.99
Atchison, Topeka and Santa Fe R.R.	12*	30	5	47	11	96,400	0.05	99.95
Veteran's Administration Facility	13*	36	5	54	10	87,600	0.06	99.94
Colorado Fuel and Iron Corp.	4-1/2*	80	60	144-1/2	12-1/2	109,500	0.13	99.87
Colorado Portland Cement Co.	36*	93	24	153	9-3/4	85,400	0.18	99.82

Note: Percentages in column 8 are ratios of hours in column 5 to hurs in column 7.

* Entire interruption due to break in lateral line serving thi customer.

APPENDIX D

SUMMARY OF LEASE COSTS OF
CANADIAN RIVER GAS COMPANY
DECEMBER 31, 1939

Lease Costs, Per Books	
Bonuses	$2,997,496.91
Renewal costs	127,503.50
Delay rentals	109,100.84
Costs of obtaining leases (legal services, abstracting and recording fees and expenses)	67,163.88
Consideration paid for consolidation of leases	335,791.46
Total cost per books, excluding "appreciation" (R. V, 2737, 2741)	$3,737,006.49
Adjustments Made by the Commission:	
Add: Legal fees and expenses (R. V, 2722)	51,812.14
Deduct:	
Well construction costs erroneously included in lease account which were reclassified and allowed as well costs (R. V, 2667-71)	(343,656.79)
Intercompany profits on leases acquired from affiliates (R. V, 2657-61; 2667-71)	(250,320.54)
Lease Costs Included in Rate Base	$3,[illegible],821.32*

* Includes $109,175.29 for unoperated leases (R. V, 2741). Interest during construction related to lease costs was included in a separate allowance (R. V, 2769) in the amount of $40,453.

DEPRECIATED BASE AND PLANT COSTS
ALLOWED IN RATE BASE

	Leases	Other Plant	Total
Undepreciated Plant Cost at December 31, 1939 (R. I, 149)	$2,194,841	$8,589,622	$10,784,463
Less:			
Accrued Depletion (leases & wells)	252,006	401,675	653,681
Accrued Depreciation		1,480,948	1,480,948
Total Depreciation and Depletion (R. I, 162)	252,006	1,882,623	2,134,629
Depreciated Plant Cost at December 31, 1939 (R. I, 164)	$1,942,835	$6,706,999	$ 8,649,834

** Canadian's rate base was found to be $9,375,000 (R. I, 173) after adding working capital and plant additions through December 32, 1941.

CHARLES ELMORE CROPLEY
CLERK

IN THE

SUPREME COURT OF THE UNITED STATES

October Term, 1944

Nos. 379 and 380

COLORADO INTERSTATE GAS COMPANY
a Corporation, PETITIONER

v.

FEDERAL POWER COMMISSION, CITY AND COUNTY OF DENVER, COLORADO, PUBLIC SERVICE COMMISSION OF WYOMING, COLORADO-WYOMING GAS COMPANY, PUBLIC SERVICE COMPANY OF COLORADO, AND CANADIAN RIVER GAS COMPANY, RESPONDENTS.

CANADIAN RIVER GAS COMPANY,
a Corporation, PETITIONER,

v.

FEDERAL POWER COMMISSION, CITY AND COUNTY OF DENVER, COLORADO, PUBLIC SERVICE COMMISSION OF WYOMING, COLORADO-WYOMING GAS COMPANY, PUBLIC SERVICE COMPANY OF COLORADO, AND COLORADO INTERSTATE GAS COMPANY, RESPONDENTS.

BRIEF OF THE CITY AND COUNTY OF DENVER, SUGGESTING THAT THE COURT BELOW WAS WITHOUT JURISDICTION OVER THE SUBJECT MATTER

MALCOLM LINDSEY,
353 City and County Building,
Denver 2, Colorado

THOMAS H. GIBSON,
353 City and County Building,
Denver 2, Colorado

INDEX

	PAGE
Introductory Statement	1
Opinions Below	5
Jurisdiction	5
Statute Involved	5
Question Presented	5
Subjects of Discussion	6
I. THE DESIGNATION OF THE CIRCUIT WHEREIN "THE COMPANY IS LOCATED OR HAS ITS PRINCIPAL PLACE OF BUSINESS" MADE BY SECTION 19(b) OF THE NATURAL GAS ACT IS A MATTER OF JURISDICTION AND NOT OF VENUE	6
II. SECTION 19(b) OF THE NATURAL GAS ACT DOES NOT CONFER GENERAL JURISDICTION FOR SUCH REVIEWS UPON "ANY" CIRCUIT COURT OF APPEALS OF THE UNITED STATES	6
III. WHEN THE PETITIONS FOR REVIEW WERE FILED WITH THE TENTH CIRCUIT COURT OF APPEALS, PETITIONERS WERE LOCATED AND HAD THEIR PRINCIPAL PLACES OF BUSINESS WITHIN THE THIRD CIRCUIT OF THE UNITED STATES	6
IV. THE PARTICLE "OR" WITH WHICH CONGRESS CONNECTED THE TERMS "LOCATED" ANND "PRINCIPAL PLACE OF BUSINESS" IN SAID SECTION 19(b) WAS USED AS A CONJUNCTIVE "TO EXPRESS AN ALTERNATIVE OR TERMS, DEFINITIONS OR EXPLANATIONS OF THE SAME THING IN DIFFERENT WORDS"	6

PAGE

V. A NATURAL GAS COMPANY WHICH, OR PERSON WHO, IS ENGAGED EXCLUSIVELY IN THE TRANSPORTATION OF NATURAL GAS IN INTERSTATE COMMERCE FOR RESALE, LEGALLY CANNOT "BE LOCATED OR HAVE ITS PRINCIPAL PLACE OF BUSINESS" ELSEWHERE THAN IN THE STATE OF ITS OR HIS DOMICILE FOR THE PURPOSE OF SUING OR DEFENDING PROCEEDINGS IN PERSONAM IN RELATION TO THE REGULATIO OF SUCH BUSINESS 7

VI. THE IMPOUNDING ORDER OF THE CIRCUIT COURT OF APPEALS SHOULD AT THIS TIME BE CONSTRUED AND THE DISTRIBUTION OF THE MONIES IMPOUNDED THEREUNDER ORDERED IN ACCORDANCE WITH THE TERMS THEREOF AS CONTEMPLATED BY THE NATURAL GAS ACT 7

Summary of Argument 7

Argument 11

I. THE DESIGNATION OF THE CIRCUIT WHEREIN "THE COMPANY IS LOCATED OR HAS ITS PRINCIPAL PLACE OF BUSINESS" MADE BY SECTION 19(b) OF THE NATURAL GAS ACT IS A MATTER OF JURISDICTION AND NOT VENUE 11

II. SECTION 19(b) OF THE NATURAL GAS ACT DOES NOT CONFER GENERAL JURISDICTION FOR SUCH REVIEWS UPON "ANY" CIRCUIT COURT OF APPEALS OF THE UNITED STATES 13

III. WHEN THE PETITIONS FOR REVIEW WERE FILED WITH THE 10th CIRCUIT COURT OF APPEALS, PETITIONERS

PAGE

WERE LOCATED AND HAD THEIR PRINCIPAL PLACES OF BUSINESS WITHIN THE THIRD CIRCUIT OF THE UNITED STATES 14

IV. THE PARTICLE "OR" WITH WHICH CONGRESS CONNECTED THE TERMS "LOCATED" AND "PRINCIPAL PLACE OF BUSINESS" IN SAID SECTION 19(b) WAS USED AS A CONJUNCTIVE "TO EXPRESS AN ALTERNATIVE OF TERMS, DEFINITIONS, OR EXPLANATIONS OF THE SAME THING IN DIFFERENT WORDS" 25

V. A NATURAL GAS COMPANY WHICH, OR PERSON WHO, IS ENGAGED EXCLUSIVELY IN THE TRANSPORTATION OR SALE OF NATURAL GAS IN INTERSTATE COMMERCE FOR RESALE, LEGALLY CANNOT "BE LOCATED OR HAVE ITS PRINCIPAL PLACE OF BUSINESS" ELSEWHERE THAN IN THE STATE OF ITS OR HIS DOMICILE FOR THE PURPOSE OF SUING OR DEFENDING PROCEEDINGS IN PERSONAM IN RELATION TO THE REGULATION OF SUCH BUSINESS 34

VI. THE IMPOUNDING ORDER OF THE CIRCUIT COURT OF APPEALS SHOULD AT THIS TIME BE CONSTRUED AND THE DISTRIBUTION OF THE MONIES IMPOUNDED THEREUNDER ORDERED IN ACCORDANCE WITH THE TERMS THEREOF AS CONTEMPLATED BY THE NATURAL GAS ACT 40

IN THE

SUPREME COURT OF THE UNITED STATES

October Term, 1944

Nos. 379 and 380

COLORADO INTERSTATE GAS COMPANY
a Corporation, PETITIONER

v.

FEDERAL POWER COMMISSION, CITY AND COUNTY OF DENVER, COLORADO, PUBLIC SERVICE COMMISSION OF WYOMING, COLORADO-WYOMING GAS COMPANY, PUBLIC SERVICE COMPANY OF COLORADO, AND CANADIAN RIVER GAS COMPANY, RESPONDENTS.

CANADIAN RIVER GAS COMPANY,
a Corporation, PETITIONER,

v.

FEDERAL POWER COMMISSION, CITY AND COUNTY OF DENVER, COLORADO, PUBLIC SERVICE COMMISSION OF WYOMING, COLORADO-WYOMING GAS COMPANY, PUBLIC SERVICE COMPANY OF COLORADO, AND COLORADO INTERSTATE GAS COMPANY, RESPONDENTS.

BRIEF OF THE CITY AND COUNTY OF DENVER

INTRODUCTORY STATEMENT

There is now impounded under the order of the Circuit Court of Appeals between five and six millions of dollars which, as we contend, have been wrongfully and illegally taken under compulsion from ultimate gas consumers, the majority of whom are inhabitant gas consumers of this respondent. Each month there is being and will continue to be impounded,

during the pendency of these proceedings, similar large sums which, in equity and good conscience, belong to said gas consumers.

Our contentions are that: (1) although said order was entered without authority, it is binding upon the depositor, upon whose petition it was made, and expressly provides that the moneys so to be impounded shall be

> "Subject, however, to the further order or orders of this Court, to be returned to such ultimate consumers of gas or persons to whom the Court shall find the same should be returned as contemplated by the provisions of the Natural Gas Act," and

(2) For the reason that said Court never at any time had jurisdiction over the subject matter of these proceedings, all moneys that have been collected from said inhabitant gas consumers and voluntarily deposited by said petitioner should forthwith be returned to said gas consumers or to this respondent, as their representative, for distribution to them at the costs of said petitioners.

The City and County of Denver, respondent, is a "Home Rule" City and County that is invested with full power and authority to regulate the local charges for service by public utility corporations under Article XX of the Colorado Constitution and Section 280 of its charter as amended in 1927. It is now confronted with the following facts and circumstances which it feels bound to call to the attention of this Court in fulfillment of its duties as Trustee for its said inhabitant gas consumers.

Said impounding order was entered by said Circuit Court of Appeals upon a petition for stay pending review of an order of the Federal Power Commission that was filed with said Court by the Colorado Interstate Gas Company on April 20th, 1942.

According to the averments shown on the face of said petition for "stay pending review," there was at that time a petition to "rehear and re-open" the same order that was complained of pending before the Federal Power Commission which had not been determined.

After the entry of said impounding order the petitioners herein filed with said Circuit Court of Appeals their petition

for a review of the final order of said Commission. The jurisdictional averments of said petitions were, respectively, as follows:

> (Case No. 379) "Colorado Interstate Gas Co., a Delaware Corporation * * *, petitioner is a private corporation organized and existing under the laws of the State of Delaware, which owns and operates a main transmission natural gas pipeline extending from Clayton Junction, New Mexico, to a point just outside the city limits of the City and County of Denver, State of Colorado. Its general manager and other representatives have their offices at Colorado Springs, Colorado. All of its physical properties are located, and all of its sales take place, within territory comprising the Tenth Circuit." (R.V.1, Page 1-10.)

> (Case No. 380) "Canadian River Gas Co., a Delaware Corporation * * * is engaged in the production and gathering of natural gas in what is known as the Amarillo Texas, or Texas Panhandle Gas Field, and the transportation thereof to certain points for sale, as follows: Substantially all such gas so produced is sold to the Colorado Interstate Gas Co. at a point near Clayton, New Mexico and at Grey, Oklahoma * * *." (R.V.1., Pages 37-42.)

This respondent filed its motion to dismiss said petitions on the ground that said Circuit Court of Appeals was without jurisdiction over the subject matter thereof for the reason, among others, that said petitioners were not "located and did not have their principal places of business" within the territorial limits of said Tenth Circuit. (R.V.1., Pages 122-123.)

Said motion was denied (R.V.1, Page 124), and, thereupon, permission of Court being first had and obtained, said petitioners filed an amendment to their original jurisdictional averments, by adding thereto the matters shown on Pages 125-133(R.V.1.), all of which, from the viewpoint of this respondent, is not only immaterial but emphasizes the invalidity of the original averments which, as we respectfully contend, show that the petitioners are for all purposes of

jurisdiction, for litigation, taxation and regulation, citizens of, that are domiciled or located, and, for all such purposes have their principal places of business in the State of Delaware that is comprised within the Third Circuit of the United States.

In his closing argument before this Court, the Attorney for the Colorado Interstate Gas Company called attention to the terms of said impounding order, and in response to a question propounded by the Chief Justice, indicated an intention on his part to make the contention that said gas consumers would not be entitled to said moneys on final distribution in the event of a decision adverse to said company.

Since said causes were submitted on their merits, this Court has decided the case of Central States Electrical Co. vs. City of Muscatine, Iowa, et al., (now reported in the March 1, 1945, advance sheets of the Supreme Court Reporter at Pages 565-572) and in the determination of the law as applied to the facts of that case it was held that:

> "The Circuit Court of Appeals had no power, at least in the absence of Federal legislation purporting to confer such power upon it, to adjust the gas rates of the Company selling gas to consumers in Iowa, that being a legislative function of the State of Iowa, notwithstanding the proceeding was one to enjoin collection of a rate for interstate service." (Syl.)

While that decision was based upon a statement of facts that are dissimilar to the facts appearing in the record herein, nevertheless, it may be, and as the statements of said attorney would indicate it would seem certain to be, used as a basis of argument whereby to support a general contention that, because the City and County of Denver is vested with full authority to regulate the charges for service by public utility corporations, the Tenth Circuit Court of Appeals would be without power to order the distribution of said impounded moneys to the inhabitant consumers of gas in said City and County of Denver, and thereby cause a further long drawn out delay and costly second appeal to your Honorable Court before final determination of said proceedings could be had

It is in view of the foregoing facts and circumstances that, at this time, this respondent makes this effort to see that, without unnecessary delay, its inhabitant gas consumers shall have returned to them all moneys that have been, are being and will be so illegally taken from them under compulsion under the provisions of said impounding order, and that said Colorado Interstate Gas Company shall not in any respect profit from its own wrong.

OPINIONS BELOW

The opinion of the United States Circuit Court of Appeals for the Tenth Circuit will be found in R.V.B., Pp. 5066-5094, and is reported in 142 Fed. (2d) 943. The opinion of the Federal Power Commission will be found in R. V. 1, P. 140, and is reported in 43 P. U. R. (N. S.) 205.

JURISDICTION

Jurisdiction of this court is invoked by the petitioners under Section 240(a) of the Jurisdictional Code, as amended by the Act of February 13, 1925, and Section 19(b) of the Natural Gas Act (52 Stat. 821; Title 15, U. S. C. A., Sec. 717(r)):

STATUTE INVOLVED

The statute involved is the Natural Gas Act (52 Stat. 824, 15 U. S. C. A. 717-(r)), and particularly Section 19(b) thereof, which, insofar as material for the consideration of the issue herein presented, provides:

> Sec. 19(b) "Any party to a proceeding under this chapter aggrieved by an order issued by the Commission in such proceeding, may obtain a review of such order in the Circuit Court of Appeals of the United States for any circuit wherein the natural gas company to which the order relates is located or has its principal place of business, or in the United States Court of Appeals for the District of Columbia • • • "

QUESTION PRESENTED

The primary questions presented are (1) whether the United States Circuit Court of Appeals for the Tenth Circuit

had jurisdiction over the subject matter of the Petitions for Review, (2) whether said impounding order should be at this time construed and the distribution of moneys impounded thereunder ordered in accordance with the terms thereof as contemplated by the Natural Gas Act.

SUBJECTS OF DISCUSSION

In view of arguments that heretofore have been made and the statements made in the opinion of said Circuit Court of Appeals, the propositions that we have to submit in support of our motion will be presented under the following headings.

I.

THE DESIGNATION OF THE CIRCUIT WHEREIN "THE COMPANY IS LOCATED OR HAS ITS PRINCIPAL PLACE OF BUSINESS" MADE BY SECTION 19(b) OF THE NATURAL GAS ACT IS A MATTER OF JURISDICTION AND NOT OF VENUE.

II.

SECTION 19(b) OF THE NATURAL GAS ACT DOES NOT CONFER GENERAL JURISDICTION FOR SUCH REVIEWS UPON "ANY" CIRCUIT COURT OF APPEALS OF THE UNITED STATES.

III.

WHEN THE PETITIONS FOR REVIEW WERE FILED WITH THE TENTH CIRCUIT COURT OF APPEALS, PETITIONERS WERE LOCATED AND HAD THEIR PRINCIPAL PLACES OF BUSINESS WITHIN THE THIRD CIRCUIT OF THE UNITED STATES.

IV.

THE PARTICLE "OR" WITH WHICH CONGRESS CONNECTED THE TERMS "LOCATED" AND "PRINCIPLE PLACE OF BUSINESS" IN SAID SECTION 19(b) WAS USED AS A CONJUNCTIVE "TO EXPRESS AN ALTERNATIVE OF TERMS, DEFINITIONS OR EXPLANATIONS OF THE SAME THING IN DIFFERET WORDS."

V.

A NATURAL GAS COMPANY WHICH, OR PERSON WHO, IS ENGAGED EXCLUSIVELY IN THE TRANSPORTATION OF NATURAL GAS IN INTERSTATE COMMERCE FOR RESALE, LEGALLY CANNOT "BE LOCATED OR HAVE ITS PRINCIPAL PLACE OF BUSINESS" ELSEWHERE THAN IN THE STATE OF ITS OR HIS DOMICILE FOR THE PURPOSE OF SUING OR DEFENDING PROCEEDINGS *IN PERSONAM* IN RELATION TO THE REGULATION OF SUCH BUSINESS.

VI.

THE IMPOUNDING ORDER OF THE CIRCUIT COURT OF APPEALS SHOULD AT THIS TIME BE CONSTRUED AND THE DISTRIBUTION OF THE MONIES IMPOUNDED THEREUNDER ORDERED IN ACCORDANCE WITH THE TERMS THEREOF AS CONTEMPLATED BY THE NATURAL GAS ACT.

SUMMARY OF ARGUMENT

The major points proposed for consideration in connection with the language of said Section 19(b) of the Natural Gas Act and of the jurisdictional averments of said petitions for review are:

(1) By Paragraph 3 of Section 8, Article I, of the United States Constitution, exclusive authority is conferred upon the Congress "to regulate commerce * * * among the several states, * * *."

(2) By the Natural Gas Act, administrative authority is conferred upon the Federal Power Commission for the regulation only of business of natural gas companies that is exclusively in interstate commerce (Sec. 1(a) and (b) of the act (15 U. S. C. 717)); and a "natural gas company" is defined by section 2, Paragraph 6, of said Act as, "A person engaged in the transportation of natural gas in interstate commerce or the sale in interstate commerce of such gas for resale."

(3) The transportation or sale of natural gas in interstate commerce by a natural gas company for resale, is a business exclusively in interstate commerce and consists in the exercise of a franchise right to engage in such business which is the principal thing from which all other rights in furtherance thereof spring; in relation to which they are incidents, and the franchise to engage in which is a grant in gross of an incorporeal hereditament that is not appertinent to any particular land or property, but is itself intangible personal property that follows the law of the person of its owner under the common law maxim *mobilia sequuntur personam*, and which for all purposes of jurisdiction, administration, regulation, and taxation, can have no other business situs than that of the domicile of its owner.

(4) A natural gas company under whose certificate of incorporation a franchise right to engage in such a business has been granted by a sovereign state of the United States, cannot be "located or have its principal place of business" elsewhere than in the state of its creation, wherein, of necessity, it must be located and have its principal place of business in order to have any legal existence for the purpose of suing or defending at all.

(5) The particle *or*, as used in said Section 19(b), legally could not have been made use of by the Congress as a disjunctive in the sense of having been intended to answer to an implied preceding "either," but only as a conjunctive "to express an alternative of terms, definitions, or explanations of the same thing in different words," because a corporation legally cannot be located or have its principle place of business elsewhere than in the state by which it was created, and, as a matter of law, that place is the place in that state wherein its "principal office" is located, under the laws thereof, and the terms of its charter or certificate of incorporation upon which its franchise right to be a corporation and to exercise such franchise rights thereby granted were made to depend.

(6) The major and minor premises and conclusions that are embraced within the foregoing generalized statement are:

(a) "Where Congress has not expressly declared a word to have a particular meaning, it will

be presumed to have used the word in its well understood public and judicial meaning," (Toxaway Hotel Co. v. Smathers and Co., 246 U.S. 439), for the reason that it:

"must be presumed also to have had in mind the law as long and uniformly declared by the courts of this country" (Shaw vs. Quincy Mining Co., 145 U.S. 444, p. 449).

(b) Ever since the decision of Covington Drawbridge Co. vs. Shepard et al., infra, wherein Chief Justice Taney said:

"The Covington Drawbridge Company, being chartered by the State of Indiana, it *necessarily* has *its home and place of business* in that state."

this Court and the courts in general of this country have uniformly held and declared that a domestic corporation cannot have ITS "legal existence, home, residence, habitat, domicile, citizenship, location, 'principal office OR place of business'" for purposes of jurisdiction, for litigation, taxation, regulation and other purposes elsewhere than in the state by which it was created; and that, even for such purposes, it is only because the "members of a local 'corporation' are conclusively presumed to be citizens of the State by whose laws it was created, and in which alone the corporate body has a legal existence" that such a corporation can sue or be sued in a Federal Court at all. (Bank of Augusta vs. Earle, 13 Peters 519; Thomas vs. Board of Trustees, 195 U. S. 207, 210, 211).

(c) Section 19(b) of the Natural Gas Act vests jurisdiction only in "any Circuit Court of Appeals of the United States for the circuit wherein the Natural Gas Company to which the order relates is located or has *its* principal place of business," and it is fundamental that:

"Legislative enactments where the language is unambiguous cannot be changed by construction, nor divested of its plain and obvious meaning (State Tonnage Tax Cases, 12 Wall. 204, 217).

(d) It is as thoroughly established by the decisions of this and other courts of this country that the incidental

"means and instruments" by which a business in interstate commerce is carried on or conducted are a part of that business, that have no legal existence apart from the business itself, which is the principal, intangible thing to which such "means and instruments" are incidents, and that such "means and instruments" do not and cannot have an independent "location or place of business" of their own apart from that of their owner for purposes of litigation, jurisdiction, regulation, taxation and other purposes, as it is self evident that Congress has no authority under the Commerce clause of the Federal Constitution to regulate anything else than "commerce with foreign nations, and among the several States, and with the Indian Tribes"; that such "means and instruments," are, for all such purposes, only

> "means and instruments which are employed by Congress to carry into execution the powers given by the people to the Federal Government, whose laws, made in pursuance of the Constitution are supreme," and that,

for all such purposes, the only place of business that is or can exist is the place of the domicile of the owner of the business which, of necessity, follows the law of his or its person, for the simple reason that, because of its intangibility, such a business can have no legal existence, location or place of business apart from that of its owner.

In view of the conditions under which this brief and argument now has to be presented, the foregoing propositions will be discussed and supported by the authorities upon which we rely as if they were in reply to the theories that heretofore have been advanced in arguments and in statements contained in the opinion of said Circuit Court of Appeals.

ARGUMENT

I.

THE DESIGNATION OF THE CIRCUIT WHEREIN "THE COMPANY IS LOCATED OR HAS ITS PRINCIPAL PLACE OF BUSINESS" MADE BY SECTION 19(b) OF THE NATURAL GAS ACT IS A MATTER OF JURISDICTION AND NOT VENUE.

It has been argued that:

> "The designation of the circuit wherein 'the company is located or has its principal place of business' is a matter of venue and not jurisdiction."

As a matter of course (as this statement impliedly concedes), if the question raised is one respecting the jurisdiction of the subject matter, it is one that cannot be waived, and we respectfully suggest that it is such a matter because of the following reasons:

1. The ordinary jurisdiction of all circuit courts of appeals is purely appellate.

2. Such a review is an original proceeding that calls for the exercise of original jurisdiction which, except for the special statutory provisions of Section 19(b) of the Natural Gas Act, would not and could not exist in any circuit court of appeals.

3. Therefore, the purpose of that section necessarily was, according to the literal meaning of its words, to create a right, provide a remedy, and confer jurisdiction for a direct review of administrative orders of the Federal Power Commission. It particularly conditions and limits such jurisdiction in each particular case to the facts thereof which, in each instance, are made the measure by which the right, the remedy, and the jurisdiction are to be determined (18 C.J.S., Sec. 177).

This proceeding is, therefore, a strictly special statutory proceeding that calls for strict construction by the court and for similar adherence thereto by a petitioner thereunder, who, seeking such a review, "must allege exactly those facts the statute names as the basis for the right conferred" (49 C.J., P. 151, Sec. 167).

> "Such jurisdiction as the court of appeals had to review directly the action of administrative agencies is especially conferred by legislation relating specifically to the determinations of such agencies made subject to review and perscribing the manner and extent of such review." *A. F. of L. v. National Labor Board*, 308 U. S. 401, 402, 60 S. Ct. 300, 84 L. Ed. 347; *Federal Trade Commission v. Balme*, 23 Fed. (2d) 615, cert. den., 277 U. S. 598; *Chamber of Commerce v. Federal Trade Commission*, 280 Fed. 45.

By the Natural Gas Act the existence of jurisdiction is conditioned upon the existence of the jurisdictional fact that the natural gas company to which the order relates "is located or has *its* principal place of business" within the circuit wherein the proceeding is instituted. Therefore, that fact is a jurisdictional fact without the existence of which there can be no jurisdiction over the subject matter for such a review, and any attempted review by the court would be a nullity. *Noble v. Union River Logging Company*, 147 U. S. 167; *In re First National Bank of Belle Fourche*, 152 Fed. 64; *McClain v. Kansas City Bridge Co.*, (Missouri) 88 S.W. (2d) 1019.

For these reasons we respectfully suggest:

> "Jurisdiction as the term is to be applied in this instance is the power to hear and determine the controversy persented, in a given set of circumstances. If the court finds the power is not granted, it lacks jurisdiction of the subject matter and must refrain from any adjudication of rights in connection therewith." *In the Matter of the Petition of National Labor Board*, 304 U.S. 486, 58 S. Ct. 1001, 83 L. Ed. 1482; *Spring Coal Co. v. Commissioner of Internal Revenue*, 38 F. (2d) 764; *State ex rel. v. Nixon*, 232 Mo. 496, 134 S. W. 538.

Because the statute does not purport to confer general jurisdiction upon all circuit courts of appeals as a class to hear and determine every such review of the class of reviews for which it confers such a conditioned right and remedy; but fixes the condition under which the jurisdiction may be exercised in each particular instance, both the jurisdiction and the remedy are exclusive (1 C. J. 989, 990), and, if this be a correct statement, we respectfully suggest that in this pro-

ceeding the Tenth Circuit Court of Appeals was without jurisdiction over the subject matter under the rules as stated above and in *Galpin v. Page*, 18 Wall. 350, 31 L. Ed. 959, P. 964, wherein it is said that,

> "Where the general powers of the court are exercised over a class not within its ordinary jurisdiction upon the performance of prescribed conditions, no such presumption (of jurisdiction) will attend the judgment of the court. The facts essential to the exercise of the special jurisdiction must appear in such cases upon the record. The extent of the special jurisdiction and the condition of its exercise over subjects or persons necessarily depend upon the terms upon which the jurisdiction is granted and not upon the rank of the court upon which it is conferred. Such jurisdiction is not therefore the less to be strictly pursued because the same court may posses over other subjects or persons a more extended and general jurisdiction."

For these reasons we respectfully suggest that the question here involved is peculiarly one respecting jurisdiction of the subject matter, and that it is, therefore, one over which the parties to the proceeding can neither by consent confer jurisdiction nor by agreement or conduct waive or estop themselves from questioning. 15 C. J. 802, 806, 844: *Utah-Nevada Co. v. LeLamar*, 113 Fed. 112.

Even if the matter were one of *venue* that might be a subject of waiver, no such waiver can be attributed to this respondent, because it appeared specially for the purpose and moved the lower court to dismiss the petitions on the ground of its lack of jurisdiction (*Leonardi v. Chase National Bank*, 81 Fed. (2d) 19-22).

II.

SECTION 19(b) OF THE NATURAL GAS ACT DOES NOT CONFER GENERAL JURISDICTION FOR SUCH REVIEWS UPON "ANY" CIRCUIT COURT OF APPEALS OF THE UNITED STATES.

Heretofore the argument has been made to the effect that:

> "The use of the comprehensive term 'any circuit' plus the unqualified availability of the Court of Appeals for the District of Columbia, show a congressional intention to vest all intermediate federal appelate courts with the power to review orders of the Commission, leaving the selection of the particular tribunal to the petitioner for review, subject only to objection by the respondent if the circuit selected possesses none of the qualifications specified in Section 19(b), since there is thus a general grant of power to all the Courts of Appeals. The question of which one should exercise that power in a particular case is a question of venue."

If this construction of said section were correct, it would confer jurisdiction upon any Circuit Court of Appeals of the United States, regardless of the circuit for which any such court might have general appelate jurisdiction. But according to its plain words the jurisdiction conferred thereby is a territorial jurisdiction limited to "any Circuit Court of Appeals for the circuit wherein the natural gas company to which the order relates is located or has its principal place of business"; consequently, any other Circuit Court of Appeals than the Circuit Court of Appeals for that particular circuit would not, according to the unambiguous words of the statute, be a court of competent jurisdiction. In Robertson v. Railroad Labor Board, 268 U. S. 619, 45 S. Ct. 621 it is said that: "We are of opinion that by the phrase 'any District Court of the United States' Congress meant any such court 'of competent jurisdiction.' The phrase 'any court' is frequently used in the federal statutes and has been interpreted under similar circumstances as meaning 'any court of competent jurisdiction.'"

III.

WHEN THE PETITIONS FOR REVIEW WERE FILED WITH THE TENTH CIRCUIT COURT OF APPEALS, PETITIONERS WERE LOCATED AND HAD THEIR PRINCIPAL PLACES OF BUSINESS WITHIN THE THIRD CIRCUIT OF THE UNITED STATES.

Heretofore an argument has been made to the effect that:

> "At the time the petition for review was filed • • • the integrated system was *conducted* in all its business and operating phases from the offices maintained by petitioners" that were purely administrative offices in charge of subordinate agents. (142 Fed. (2d) Page 951 par. [4]).

This theory is based upon the false assumptions that offices, agents, agencies, and properties that are mere incidental "means and instruments" that are devoted by the owner thereof to, and constitute a part of, a public utility business that is exclusively in interstate commerce, and that are "managed, supervised, and directed" by its subordinate agents from a central office in a state of its own selection other than the state wherein such owner itself is "located or has its principal office," constitute the place where its business in interstate commerce is conducted, and that the place where such offices, agents, agencies, "means, and instruments" happen to be so located by such owner for the more convenient operation of such incidental "means and instrumentalities," is the place where such public utility company itself is located and has its principal place of business.

But this theory substitutes the location of mere incidental "means and instrumentalities" that are in charge of subordinate agents and are themselves a part of a business that is exclusively in interstate commerce and in no proper sense constitute or contribute to the doing of a local business of any kind, for the location of the owner of the national business of which such "means and instrumentalities" are but incidents, and asserts that the states wherein such "means and instrumentalities" are managed, supervised, and directed by such subordinate agents is the "principal place of business" of the owner of the business which is national in character and extent, both within and without the states wherein such "means and instrumentalities" are located, managed, supervised, and directed, all in disregard of the fact that the "operation" of such incidental "means and instrumentalities" does not constitute or contribute to the "doing" of a local business within those states, and, for that reason, their location does not constitute a place of business of the owner of the national business of which such "means and instrumentalities" are mere incidents; and the further fact that such a corporate entity cannot, for such purposes,

legally be "located or have its principal place of business" or legal existence elsewhere than in the state by which it was created.

Furthermore, said theory ignores the fact that said agents, agencies, "means and instrumentalities" are subordinates of, and are subject to the superior control and direction of, the stockholders and directors who are the governing powers who control the corporate affairs and prescribe the policies of such corporate entities in their exercise of such franchise rights from which such businesses in interstate commerce spring and of which they are themselves but incidents.

Said petitions for review show on their faces that said petitioners are Delaware corporations whose "principal offices" are located in the City of Wilmington, County of Newcastle, in that state (R. V. 2, P. 633, 647); therefore, instead of the offices that are located at Colorado Springs for the more convenient "management, supervision, and direction" of the "operation" of such "means and instrumentalities" that constitute a part of said national business, being the "principal offices" or places where said natural gas companies are "located or have their principal places of business," they are but subordinate administrative offices, agencies, "means and instrumentalities" that are entirely devoted to and a part of said business in interstate commerce, that is itself an incident of the franchise right to engage in it and that is national in its character and extent both within and without the states wherein such offices, agents, agencies, "means and instrumentalities" are located.

For these reasons, we respectfully submit that it affirmatively apears on the faces of said petitions for review that said natural gas companies are not "located" and that they do not "have their principal places of business," within the Tenth Circuit; and that said petitions fail to even mention any place where the stockholders and directors of said companies actually meet to determine their policies and transact their corporate affairs; and that for such reasons the Tenth Circuit Court of Appeals was without jurisdiction over the subject matter of said controversies, because:

> "The business actually engaged in by the appellant (petitioners) was exclusively in interstate

commerce. The maintenance of an office, the purchase of supplies, employment of labor, maintenance and operation of telephone and telegraph lines and automobiles, and appellant's other acts within the Sate, were all exclusively in furtherance of its interstate business; and the property itself, however extensive or of whatever character, was likewise devoted only to that end. They were means and instrumentalities by which that business was done and in no proper sense constituted, or contributed to, the doing of a local business." Ozark Pipe Line Corporation v. Monier, 266 U. S. 555, 45 S. Ct. 184, 186.

"The transportation from wells outside of Ohio by the lines of the producing companies to the state lines and thence by means of appellant's high pressure transmission lines to their connection with its local systems is essentially national—not local—in character and in interstate commerce within as well as without that state."

"It is elementary that a state can neither impose a tax on the act of engaging in interstate commerce nor on gross receipts therefrom." East Ohio Gas Company v. Tax Commission, 283 U. S. 465, 51 S. Ct. 499, p. 500; Norfolk, etc., R. Co. v. Pennsylvania, 136 U. S. 114, 10 S. Ct. 958, 34 L. Ed. 394; Missouri v. Kansas Gas Co., 265 U. S. 298, 44 S. Ct. 544; United Fuel Co. v. Hallanan, 42 S. Ct. 105, 66 L. Ed. 234, 257 U. S. 277; Eureka Pipe Line Co. v. Hallanan, 257 U. S. 265, 42 S. Ct. 101, 105; State Tax Commission v. Interstate Gas Co. 284 U. S. 41, 52 S. Ct. 62, 76 L. Ed. 156; Heyman v. Hays, 236 U. S. 178, 35 S. Ct. 403, 59 L. Ed. 527; Illinois Gas Co. v. Central Illinois P. S. Co., 314 U. S. 498, 62 S. Ct. 384; Pennsylvania Gas Co. v. Public Service Commission, 252 U. S. 23; Haskell v. Kansas Natural Gas Co., 224, U. S. 217; Public Util. Commission v. Attleboro, 273 U. S. 83, 47 S. Ct. 294; Peoples Natural Gas Co. v. Public Util. Commission, 270 U. S. 550, 46 S. Ct. 371; Public Utilities Commission v. United Fuel Gas Co., 317 U. S. 456, 63 S. Ct. 369, 375; Smith v. United Fuel Gas Co. (West Virginia); 112 S. E.

205; Miller v. United Fuel Gas Co. (West Virginia), 106 S. E. 419; Minnesota Rate Cases, 230 U. S. 352; Southern Pacific Co. v. Kentucky, 222 U. S. 63; Gloucester Ferry Co. v. Pennsylvania, 114 U. S. 196; West v. Kansas Natural Gas Co., 221 U. S. 229.

While it is, as a matter of course, conceded that the power to tax as property, and the power to regulate, as a public utility, the business of a natural gas company that is engaged in public service, are distinct powers, the exercise of the former being done under the taxing power, and of the latter, under the police power, of government, it would seem to be certain that the question whether, in a given instance, power exists in a particular government for the exercise of either or both of such powers, is purely a question of authority or jurisdiction. In truth, by its taxation, such a business would be indirectly regulated, and, in that sense the power to tax may be said to be a power to regulate. Consequently, whether the jurisdiction sought to be sustained in any given case be for the regulation of such a business in interstate commerce or the franchise right to engage in it by the taxation thereof under the power to tax or by the regulation thereof under the power to regulate, the question is purely one of jurisdiction over the subject matter, because:

> "The exclusive power is, by the Constitution of the United States, delegated to Congress to regulate interstate commerce, and the power to tax is a power to interfere with, or *regulate* * * * "; and
>
> "Commerce is business * * *. It relates to the commercial transaction more than to the calling or occupation; and *any* burden placed upon the income of *commerce* between the states by local authority or *any* impediment to its freedom is an entrenchment upon the power of Congress." City of Topeka v. Jones, 86 P. 162; McCall v. California, 136 U. S. 108; Lyng v. State, 135 U. S. 161, 166.

Our contentions are that the principles set forth in the foregoing cases apply with equal force to both the taxation and the regulation of such business; that states have no more authority to impose burdens upon such a business in interstate commerce by the exercise of one of said powers than by the

exercise of the other; that a business exclusively in interstate commerce is not within the jurisdiction of a state for the exercise of one of said powers any more than for the exercise of the other, for the reason that such business is not local in character or extent; and that, *because* all "means and instrumentalities" that are exclusively in furtherance of, and devoted to, and by which such a business is "*done*," are parts thereof and "in no proper sense constitute or contribute to, the *doing* of a *local* business," for all purposes of jurisdiction for the regulation and/or taxation of such *business*, "such means and instrumentalities" are exactly as foreign to states other than the state of the business domicile of the owner of the business, as is the business exclusively in interstate commerce itself. Consequently, our contention is that, for such purposes, the fact that such "means and instrumentalities" might be located within states other than the state of the business domicile of the owner of such a business (notwithstanding the fact that they might, to the extent that they might consist of *tangible* personal or real property, acquire an actual situs for the purpose of local taxation and sanitary regulation) cannot make of the location of such "means and instrumentalities" in such other states, the place where, or "circuit within which the natural gas company to which the order relates is located or has its principal place of business."

From this viewpoint, we respectfully suggest that the decisions of this court hereinbefore cited, bring the theory that "the integrated system was conducted in all its business and operating phases from the offices maintained by the petitioners," into direct conflict with every authority upon the issue here presented, not only because the maintenance of such offices by the petitioners at the places of their own selection constitutes nothing more or less than the maintenance of agencies or means or instruments for the conduct of "integrated systems" that are in themselves nothing more or less than "means or instrumentalities" designed by petitioners for their own convenience in the conduct of public utility businesses exclusively in interstate commerce, to which both said offices and systems are devoted and of which they constitute a part, but because of the following further reasons:

The franchise right to engage in such an interstate business is the principal thing from which all other rights, prop-

erty, means, and instruments, that are used in connection therewith, spring, and of which they are all but incidents. Such a franchise is a grant in gross of an incorporeal hereditament, that is not appertinent to any specific land or property, and together with the business in which it is engaged and that is incident to its use by its owner, is intangible personal property (Chapman Valve, etc., Co. v. Oconto Water Co., 89 Wisconsin 264; Consolidated Gas Co. v. Baltimore, 101 Maryland 532, 109 A. S. R. 584, 586; Trust Co. of America v. City, 182 Fed. 64, 68).

Such a franchise is a part of the capital of the company that owns it and such capital is intangible property (C. M. & St. Paul R. Co. v. Harmon, 89 Mont. 1, 295 P. 762-769; State Tonnage Tax Case, 12 Wallace 220; National Paper Co. v. Mass., 246 U. S., 135, 142).

Such personal property, by reason of its intangibility, not only consists in its ownership and use, (Dawson v. Ky. Dis. & Warehouse Co., 255 U. S. 288), but it follows the law of the person of such owner under the common law doctrine *mobilia sequuntur personam* (Blodgett v. Silberman, 277 U. S. 1, 48 S. Ct. 410). Therefore, for all jurisdictional purposes for the regulation of the exercise of such franchise rights, all "means and instruments" that are devoted thereto, are but "means which are employed by Congress to carry into execution the powers given by the people to the Federal Government, whose laws, made in pursuance of the Constitution, are supreme." (Transportation Co. v. Wheeling (99 U.S. 273, 277; State Tonnage Tax Cases, 12 Wall. 204).

As shown hereinbefore, said petitioners are citizens of, that are domiciled in, the State of Delaware, wherein their principal offices are located. They are, therefore, "located and have their principal places of business" in that state wherein alone they have or can have any legal existence, be located or have their principal offices or places of business for the exercise of such primary franchise rights or the conduct of their corporate affairs. While ordinary private corporations may conduct or transact ordinary, private industrial business, when so authorized by their charters, elsewhere than in the states by which they are created, a public utility corporation whose business consists only in its exercise of

such a right to engage exclusively in interstate commerce cannot, for such a purpose, be located or have its principal place of business other than in the state of its creation, because, in its exercise of such a primary corporate right in the conduct of such a national business, it does not "do business" within any other state than that of it own creation, however numerous or extensive may be the "means and instrumentalities" that it may own or employ in the furtherance of such business elsewhere than within the state by which it was created (West v. Kansas Natural Gas Co., 221 U. S. 229; Sioux Remedy Co. v. Cope, 235 U. S. 197, 203; Western Union Telegraph Co. v. Kansas, 216 U. S. 1, 27; Davis v. Cooper, 262 U. S. 318; International Textile Co. v. Pigg, 217 U. S. 91).

> "The fact that certain acts or transactions require an office and employees to perform and transact them, is not important in determining whether they constitute interstate commerce, and it is not essential to interstate commerce that persons engaged in it have established places of business in the several states or in more than a single state" (15 C. J. S. 281).

The petitions for review herein and the certificates of incorporation of the petitioners show that they were incorporated and have their "principal offices" in the State of Delaware, with authority from that state to conduct such a business in interstate commerce, but they make no pretense of showing any authority from any other state for the conduct of that or any other kind of business. Said petitioners, therefore, have the absolute right to own, occupy, maintain, and operate whatever property, offices, facilities, "means, or instrumentalities" that may be necessary or incidental to the conduct of that business anywhere within the United States; and that business, being national in character and local in its territorial limits to no state or judicial circuit of the United States, petitioner cannot be located or have its principal place of business elsewhere than in the State of Delaware, to which such business in intertate commerce can be referred, because such principal places of business can only be:

> "Where the governing power of the corporation is exercised, where those who meet in counsel have

a right to control its affairs * * *, and not where the labor is performed in executing the requirements of a corporation in transacting *its* business." (Carter v. Spring Branch, 113 Connecticut 636.)

Chapter 65 of the Revised Code of Delaware, under which petitioners were incorporated and by which they are bound (R. V. 2, P. 640) expressly provides that:

(Sec. 5) "The certificate of incorporation shall set forth * * * (2) the name of the county and the city, town or place within the county in which its principal office or place of business is located in this state."

(Sec. 29) "The original or duplicate stock ledger * * * shall, at all times during usual hours of business be open to the examination of every stockholder at its principal office or place of business in this state."

(Sec. 32) "Every corporation shall maintain a principal office or place of business in this state."

The certificates of incorporation of each of the said petitioners, as shown hereinbefore, say:

"Its principal office in the State of Delaware is located at 7 West 10th Street in the City of Wilmington, County of New Castle" (R. V. P. 633, 647).

And Section 19(b) of the Natural Gas Act says as plainly as words can say that jurisdiction for such a review can be obtained only:

"In the Circuit Court of Appeals of the United States for any circuit wherein the natural gas company to which the order relates is located or has its principal place of business."

Consequently, petitioners are domestic corporations of the State of Delaware, wherein they do some business that is not exclusively in interstate commerce; and because the only business they do elsewhere in the United States is, as shown on the face of said petitions, exclusively in interstate commerce, and what they do through their subordinate agencies, and instrumentalities that are devoted to said interstate business within the Tenth Circuit thereof, does not "constitute or contribute to the doing of a local business" of any

kind, as hereinbefore shown, it follows as a necessary consequence that, as natural gas companies to which said order of the Federal Power Commission relates, they have no place of business of any kind within any other than the Third Circuit of the United States, wherein the State of Delaware is comprised, to which the plain words of said Section 19(b) could possibly refer, for the simple reason that:

Carlos Ruggles Lumber Co. v. Commonwealth, 261 Massachusetts 450; 158 Northeastern 899, 900:

> "It is manifest that the petitioner during the year in question was 'carrying on' and 'doing business' in this commonwealth which was *not interstate* in its nature. Its main office and principal place of business were here. Its 'corporate functions' were carried on here. This descriptive phrase must include as matter of fair interpretation the holding of meetings of directors and of stockholders, the declaration of dividends, the maintenance of essential corporate offices such as those of the president, treasurer and secretary, the making of corporate records, the keeping of the books of the treasurer and whatever else may be necessary for the continuance of corporate existence."

Mullen v. Northwestern Accident Insurance Co., 26 S. D. 402; 128 N. W. 483:

> "By its 'principal place of business' is meant the place where its president, secretary, and board of directors meet to transact the governing business of the corporation proper, where the books of the corporation are kept; that is, where the governing power of the corporation is exercised and controlled by the board of directors and officers of such corporation, and does *not* mean every place where such corporation may happen to transact business. 6 Words & Phrases, Sec. 5559; Standard Oil Co. v. Commonwealth, 110 Kentucky 821, 62 S. W. 897; Middletown Ferry Co. v. City of Middletown, 40 Connecticutt 65; Milwaukee Steamship Co. v. City of Milwaukee, 83 Wis. 590, 53 N. W. 839, 18 L. R. A. 353."

Galveston, etc., Railway Co. v. Gonzales, 151 U. S. 496, P. 504:

"In the case of a corporation, the question of inhabitancy must be determined not by the residence of any particular officer but by the principal offices of the corporation where its books are kept and its *corporate* business is transacted, even though it may transact its most important business in another place."

State ex rel. v. Ditrict Court, 191 Iowa 244, 182 Northwestern 211:

"The presumption exists that the officers and offices of a corporation are to be found at its principal place of business as defined in its recorded articles. At common law, corporations were created to exist in some particular place. They were not permitted to have two domiciles * * *.

"The residence of a corporation, so far as it has a residence, may be considered as the place where its business is done or its franchises are exercised."

"A corporation cannot acquire a *de facto* residence for the purpose of venue, as in the instant case. It cannot confer jurisdiction or create venue. This is a legislative power."

"A corporation, unlike a natural person, has a stationary legal domicile in the state and county of its creation, which may not be changed at will, but only as authorized by statute. It is not migratory. It is a legal entity, and, as such, its existence, its name, and its residence are born of the law. It can act only through its officers and agents, and through them alone may any business be done by or with the corporation; but its officers, agents, directors, and stockholders, viewed collectively or otherwise, are not the corporation."

"Domestic corporations, being entities created by the law, can only be sued and jurisdiction obtained over them in the manner provided by statute.

"If our statute was silent in the matter, it would not be essential for a corporation upon its organization to designate its principal place of business, or that it should have an office or place of business. Such provisions are written into the statute in order to secure service of process, determine venue, and for the purpose of general jurisdiction and taxation."

IV.

THE PARTICLE "OR" WITH WHICH CONGRESS CONNECTED THE TERMS "LOCATED" AND "PRINCIPAL PLACE OF BUSINESS" IN SAID SECTION 19(b) WAS USED AS A CONJUNCTIVE "TO EXPRESS AN ALTERNATIVE OF TERMS, DEFINITIONS, or EXPLANATIONS OF THE SAME THING IN DIFFERENT WORDS."

We respectfully submit that the uniform decisions of this court and of the courts in general in this country support the proposition that said terms, wherever and whenever they have been so associated, are the equivalents of, or synonymous with, each other and refer to one and the same place. Heretofore, we have challenged the petitioners, and now repeat the challenge, to submit a single decided case or text that has construed a statute in which said terms have been used without modification, for the purposes of jurisdiction, venue of action, taxation, or other purposes, as in said statute, that has not held them to be equivalents that give expression to the same idea. To support this challenge we submit the following from among the many cases and texts upon the subject:

Galveston, etc., Railway v. Gonzales, 151 U. S. 496.

West Travel Acc. Assn. v. Taylor, (Neb.) 87 N. W. 950.
Holgate v. Ore. Pac. R. R. Co., 16 Ore. 123;

Crookston v. Centennial Co., 133 Utah 117; 44 Pac. 714,

Mullen v. Northwestern Acc. Co., 128 N. W. 483, 484; 25 S. D. 402.

Nevertheless, in arriving at its conclusion that it had jurisdiction of the subject matter of said petitions for review, and notwithstanding the fact that the foregoing authorities were accessible to it, the Tenth Circuit Court of Appeals held, in substance, that, while said petitioners were not located within said circuit, their "principal places of business" are within it. In so doing, said court said:

> "Congress in the exercise of its discretion authorized a review in the circuit wherein the *principal business* of the corporation is *conducted* (Colorado Interstate Gas Co. v. Federal Power Commission, et al., 142 Fed. (2d) 943, 950-951)."

Plainly, said Section 19(b) of the Natural Gas Act uses no such language, and said court could have done so only upon the theory that such business in interstate commerce is actually "conducted or transacted" by subordinate agents of the company who "manage, supervise, and direct" the maintenance of an office, the purchase of supplies, the employment of labor, maintenance and operation of telephone and telegraph lines and automobiles, and other acts" within and from an administrative office at Colorado Springs, Colorado—all of which were exclusively in furtherance of said company's interstate business and devoted entirely thereto, and none of which "in any proper sense constitute or contribute to the doing of a local busines."

Not only does such a theory substitute subordinate administrative agencies for the stockholders and directors of said companies, and the place where such "means and instrumentalities" that are exclusively in interstate commerce are managed, supervised, and directed by such subordinate agents for the place "where the governing power of a corporation is exercised," but said opinion actually classified the place "where the labor is performed in executing the requirements of the corporation in transacting *its* business" as the "situs of *its* operations," and, with that statement for its premise, reached the conclusion that, "we think it clear that

the principal place of business of each company is in this circuit within the purview of the statute." (142 Fed. (2d) at page 951.)

Thereupon, said court cited, in support of said conclusion, three cases that construed the *National Bankruptcy Act*, the language of which bears no analogy to said Section 19(b) of the Natural Gas Act and the issues in which, we respectfully submit, were as foreign to the issue here involved as the East is to the West. In this manner, said Circuit Court of Appeals has reduced the issue herein to the question, "Where does each of these natural gas companies to which the order relates" have *its* principal place of business."

We respectfully submit that neither of said petitioners has its principal place of business in said circuit, and that the conclusion stated in said opinion is manifestly erroneous for the further reasons:

It is especially to be noted, and particular attention is called to the facts that (1) the theory so advanced makes no distinction whatever between the business of a public utility company that is engaged exclusively in an interstate business of such general public concern and the business of a private corporation that consists only of ordinary industrial business; and (2) it makes no distinction between the principal place of business of a corporation for the conduct of its corporate affairs in the exercise of its primary franchise rights, and the principal place or places of business or businesses for the conduct or transaction of ordinary private industrial business, the conduct of which might constitute some of the objects or purposes for which a private corporation might be created, as stated in its articles of incorporation, pursuant to the statutes of the state by which it is created, and which legally might be conducted in any state or county where permitted.

Said opinion fails to give consideration to the principles that the place where a corporation "is located or has its principal place of business" is one of contractual relationship with the state of its creation, upon which its legal existence depends, and that is determined and governed by the law of that state, while the place or places where it might conduct or carry on its ordinary private industrial business is purely a matter of fact that is determined and governed by, and di-

pendent only upon its own selection, and the comity of any states or countries wherein it might desire to conduct or transact such business. It fails to give consideration to the facts that, in relation to the public from which it derives its corporate being and business domicile for the conduct of its corporate affairs, it is bound by the law of its creation to have and maintain its principal office and place of business within the state of its creation, especially when so required, as by the statute of Delaware and its contract so to do; and because as a matter of common law, it cannot be located or even have a legal existence elsewhere for the conduct of its corporate affairs. (State ex rel. District Court, 191 Iowa 244, 182 Northwestern 211, P. 212; Gorman v. Leach, 11 Fed. (2d) 454, P. 456; Ex Parte Shaw, 145 U. S. 444).

On the other hand, said opinion fails to give consideration to the fact that, in its relations with private individuals in conducting or transacting ordinary industrial business, the conduct or transaction of which might have constituted some of the objects or purposes it proposed in its certificate or articles of incorporation, such a private corporation may have and maintain as many principal places of business as it may from time to time see fit to establish anywhere in any state or country that does not refuse it permission so to do (Standard Oil Co. v. Commonwealth, 110 Kentucky 821, 822; 62 Southwestern 897; Frick v. Norfolk & Co., 86 Fed. 725, 729, 730; Jossey v. Railway Co., (Georgia) 28 Southeastern 273, Georgia 95 Fed. (2d) 946; U. S. v. Shotter, 110 Fed. 867; Stanton v. State Tax Commission, 117 Ohio 436, 159 Northeastern 823).

The Natural Gas Act says nothing whatever concerning any place or places of business or businesses for the conduct, transaction, or carrying on of any private industrial business which might have been stated in the petitioners certificate or articles of incorporation as the purposes of such incorporation. And the business here involved, being of a public nature and, exclusively in interstate commerce, ordinary private industrial business, is beside the question at issue herein and wholly immaterial because even Congress has no jurisdiction for the regulation of such business.

The consequence is that the Tenth Circuit Court of Appeals illegally assumed jurisdiction over the subject matter of these controversies by substituting the place where "means

and instruments" of interstate commerce are physically located for the place where the natural gas companies that own them have their principal places of business, and thereby endowed such companies with "the faculty of arbitrarily selecting" a place for the review of the orders of the Federal Power Commission "in defiance of the law of domicile" (So. Pac. Co. v. Ky., 222 U. S. 63, P. 68).

This was simply a ratification of the theory advanced by the petitioners herein, to the effect that the integrated system was conducted in all its business and operating phases from the offices maintained by petitioners at Colorado Springs. But, we respectfully submit, this does violence to the unambiguous words of said Section 19(b), which has relation solely to the "location or principal place of business of the natural gas company," and, according to the uniform decisions of this court and courts of the country in general, that language refers and can refer only to one and the same place, because the particle "or" that connects said terms is a conjunctive, and said terms are but alternative expressions for the same thing.

We furthermore respectfully submit that this construction of such language is so interrelated with other fundamental principles of corporation law that, of necessity, from the time the first statute that required certificates of incorporation to state the location of the "principal office or place of business" in the state of its creation, was first construed, it became an elementary principle of corporation law in this country, because:

At common law the legal existence, the home, the domicile, the habitat, the residence, the citizenship of a domestic corporation can only be in the state by which it was created (Ex parte Shaw, 145 U. S. 444, P. 449).

A corporation at common law cannot be established or located elsewhere than in the state of its creation by or under the authority of its charter; it must dwell in the place of its creation and cannot migrate to another sovereignty. It cannot change its residence or citizenship and must live and have its being in the state by which it is created. (Bank of Augusta v. Earle, 13 Peters 519 Ex Parte Schollenberger, 96 U. S. 369, 377, 378).

In the case of a corporation the question of habitation must be determined not by the residence of any particular officer but by the principal offices of the corporation where its books are kept and its *corporate* business is transacted, even though it may transact its most important business in another place (Galveston, etc., Railway v. Gonzales, 151 U.S. 496, P. 504).

At common law the place of location of its principal office must be the point at which the corporation as a corporate entity, resides; and, although it may establish subordinate offices of a purely administrative character elsewhere, a distinction must be taken between the principal office of a corporation and such administrative offices as may from time to time be created by it for the more convenient transaction of the business for the conduct of which it was created. It must have a place at which its corporate functions may be performed (Frick v. Norfolk & Ovr. Co., 86 Fed. 725, 729, 730).

For all purposes of suing and being sued within or without the state of its creation, that state is the only place where a corporation can be located, domiciled, reside, inhabit, have a legal existence, home, citizenship, principal office or place of business, because a corporation that is chartered by a state,

> "Necessarily has its home and place of business in that state" (Covington v. Drawbridge Co., 20 How. 227, P. 233).
>
> "It must have a home, a legal existence, a domicile, a principal place of business within the boundaries of the state which creates it. It may send agents into other states to do business, but it cannot migrate in a body to go beyond the jurisdiction of the laws which bind and hold it together. It dissolves into its original elements, and the persons who compose it become only individuals." (State ex rel. v. Milwaukee, etc., Co., 45 Wisc. 579; Land Grant R. & T. Co. v. Commissioner of Coffey County, 6 Kan. 243; Illinois v. Beach, 1 Beas. 31).

Even the ability of a domestic corporation to sue or defend in a Federa lcourt at all has its foundation established in the soil of a "conclusive presumption that the members

thereof are citizens of the state by whose laws it was created and in which alone the corporate body has a legal existence" (Thomas v. Board of Trustees, 195 U. S. 207, 210, 211; Bank of Augusta v. Earle, 13 Peters 519).

On the other hand, it would seem to be equally elementary and academic that at common law the particular place or point within the state of its creation at which its principal office and place of business was to be located was not required to be set forth in the certificate or articles of incorporation of such corporations, and it was the serious difficulties and embarrassments that were caused to litigants in instituting suits, sheriffs and other officers in executing process, and revenue officials in assessing taxes that necessitated resort to oral proof for the establishment of that place, and that were the impelling causes for the enactment in almost all the states of the Union of statutes for the purpose of definitely locating every corporation incorporated thereunder, and its principal place of business, in the state of its creation; and that such statements in certificates or articles of incorporation, in conformity with such statutes, are conclusive (Lloyd's Executorial Trustees v. City of Lynchburg, 112 Va. 627; 75 S. E. 233; 1 Clark & Marsh, Private Corporations, Sec. 122).

1 Machen, Modern Law Corporations, Section 114, says that: "General corporation laws usually require that the incorporation papers shall contain certain particulars regarding the company's office or place of business."

After stating that the original on which such statutes were modeled is the English law, Mr. Machen says, in the same section, "The statutes of almost all states of the Union require that the location of the chief office or place of business in the state shall be specified in the incorporation papers (14 C. J. 338-340; 9 Fletcher Cyc. Corp., P. 661, Sec. 4373).

For the support of the proposition that the particle "or" as used in said Section 19(b) has the established judicial meaning that we suggest, we respectfully call attention to the following:

Said terms as used in such statutes have been construed by the courts as follows:

The place where the principal office is to be located is to be regarded as the residence of the corporation. Fairbanks

Shovel Co. v. Wills, 240 U. S. 648; Pelton v. Transportation Co., 37 O. S. 450; Harrison Bristol v. C. & A. R. R. Co., 15 Ill. 463; First National Bank of Everett v. Wilcox, 72 Wash. 473, 130 Pac. 756; Creditors v. Consumers Lumber Co., 98 Cal. 318; 319, 33 Pac. 196, 197; Gallup v. Drainage District, 107 Cal. 171, 74; 151 Pac. 1142; Sangamon etc., R. R. Co. v. County of Morgan, 14 Ill. 163; Jenkins v. Stage Co., 22 Cal. 538; In re A. B. Oil Co., 95 F. (2d) 946.

"The term 'principal office' was intended to include principal place of business." Bernstein v. Kaplin, 150 Ala. 22, 48 So. 581; Trans. Co. v. Wheeling, 99 U. S. 273.

For the purpose of jurisdiction the phrase "principal place of business" is synonymous with "domicile." Plummer and Lewis Co. v. Francher; (Ala.) 71 So. 907.

The terms "principal office" and "principal place of business" are synonymous. In re Federal Contracting Co., 212 Fed. 688, 692; State v. Mobile, etc., R. Co., 108 Ala. 29, 18 So. 801; Roberson v. Greenleaf Lumber Co., 153 N. Car. 120, 68 S. E. 1064; Hurley v. Tucker, 142 N. Y. S. 980, 985; Foreman Clark Mfg. Co. v. Bartler, 211 N. Y. S. 602, 604; People, ex rel. Barker, 34 N. Y. S. 269, 270.

The "principal office or place of business" means the domicile of the corporation. Southern Express Co. v. Patterson, 122 Tenn. 279, 123 S. W. 353, 359.

The terms "the principal office or principal place of business" of a corporation are but alternative expressions for the same thing and mean one and the same place. State ex rel. Harrington v. Vincent, 144 Wash. 246, 257 Pac. 849; Spratley v. L. & A. R. Ry Co., 77 Ark. 412, 95 S. W. 776.

"The "principal office" of a corporation as designated in its organic certificate fixes the location of the company. Union Steamboat Co. v. City of Buffalo, 82 N. Y. 351; The Oswego Starch Co. v. Dolloway, 21 N. Y. 449; Western Transportation Co. v. Scheu, 19 N. Y. 408; State v. Mobile and O. R. Co., 108 Ala. 9, 18 So. 801; Ex Parte Schollenberger, 96 U. S. 369, Pp. 377, 38; Firestone Tire Co. v. Vehicle Equipment Co., 155 Fed. 676.

The terms "located," "location," and "principal place of business" refer to the place "where the governing power

of the corporation is exercised, where those who meet in council have a right to control its affairs * * * and not where the labor is performed in executing the requirements of a corporation in *transacting* its business.' Carter v. Spring Perch Co., 113 Conn. 636; 155 A. 832; Mullen v. N. W. Accident Ins. Co., 25 S. D. 402; 128 N. W. 483; Standard Oil Co. v. Kentucky, 110 Ky. 821; 62 S. W. 897; Middletown Ferry Co. v. City of Middletown, 40 Conn. 65; Milwaukee Steamship Co. v. City of Milwaukee, 83 Wisc. 590; 53 N. W. 839; Leonardi v. Chase Nat'l Bank, 81 Fed. (2d) 1922.

A corporation cannot be a *resident* of a state where it has its *usual* place of business if it is other than the state of its creation. A. Wolff & Co. v. Choctaw, O. & G. R. Co., 133 Fed. 601.

It is submitted that there are no cases or texts to be found that construe the words "principal office" or "principal place of business" otherwise than as hereinbefore set forth except Mason Co. v. Sharon, 231 Fed. 861, and bankruptcy cases wherein the statutes construed used said terms with modifications and in a qualified sense that set them apart in a class by themselves that is clearly distinguishable; and that distinction has been given thorough consideration and clearly stated in Gorman v. Leach, 11 F. (2d) 454, and in State ex rel. Harrington v. Vincent, 144 Wash. 246; 257 P. 849, and in Roszelle Bros. v. Continental Coal Corp., 235 Fed. 343.

V.

A NATURAL GAS COMPANY WHICH, OR PERSON WHO, IS ENGAGED EXCLUSIVELY IN THE TRANSPORTATION OR SALE OF NATURAL GAS IN INTERSTATE COMMERCE FOR RESALE, LEGALLY CANNOT "BE LOCATED OR HAVE ITS PRINCIPAL PLACE OF BUSINESS" ELSEWHERE THAN IN THE STATE OF ITS OR HIS DOMICILE FOR THE PURPOSE OF SUING OR DEFENDING PROCEEDINGS *IN PERSONAM* IN RELATION TO THE REGULATION OF SUCH BUSINESS.

It has been argued that:

> "The principal place of business of a corporation is the place where its business is actually conducted, from which its operations are directed, and

at which it holds itself out to do business with the public.'

However coreret this statement may be with respect to the ordinary industrial business of private corporations, it has no application here, for the reasons hereinbefore stated.

This definition does violence to the plain words of said Section 19(b), which limits jurisdiction to the "principal place of business" of the natural gas company, and makes no mention or intimation of any "principal place of business" of private industrial corporations where the principal place of business for the conduct of which such companies are created is conducted, transacted, or carried on, or of any place from which industrial operations are directed or at which such a company might hold itself out to do any such business with the public.

State Tonnage Tax Cases, 12 Wall. 204, 217:

> "Legislative enactments where the language is unambiguous cannot be changed by construction, nor can the language be divested of its plain and obvious meaning."

Said definition is derived from the language of the Bankruptcy Act, which has relation to an altogether different statutory provision, that has a history of its own, and the phraseology of which not only differs most radically from that of said Section 19(b), but has required and received the application of rules of construction that were necessitated by facts and circumstances and a subject matter none of which bear any analogy to a proceeding for review such as this. We suggest that reference to the cases cited to support such a proposition except Colorado Interstate Gas Co. v. Federal Power Commission, 142 Fed. (2d) 943, are all bankruptcy cases and that in this case the Tenth Circuit Court of Appeals not only based its decision on such bankruptcy cases, but wholly failed to give any consideration to any of the points to which attention is directed hereinbefore, and, in so doing, actually gave credit to said Section 19(b) for saying the exact opposite of what it actually says and cited said bankruptcy cases as authority for the direct opposite of what those cases that construe that act actually hold as follows:

As respects the language of said Section 19(b), said opinion says that:

> "Congress in the exercise of its discretion authorized a review in the circuit wherein the *principal business* of the corporation is *conducted*, and the Principal *place* of business is where the actual business of the corporation is *conducted* or *transacted*. Cf. In re Guanacevi Tunnel Co., 201 Fed. 216; In re Hudson River Navigation Co., supra; Chicago Bank of Commerce v. Carter, 61 Fed. (2d) 986." * * *
>
> "We think it is clear that the principal place of business of each company is in this circuit within the purview of the statute. Continental Coal Corporation v. Roszelle Bros., supra (242 Fed. 243); Dryden v. Ranger Refining and Pipe Line Co., 280 Fed. 257; In re Lone Star Shipbuilding Co., 6 Fed. (2d) 192."

Here it is especially noticeable not only that said Section 19(b) does not say what this opinion states, and Congress did not thereby so much as indicate an intention to authorize a review in the circuit wherein the *principal business* in which the company is engaged is *conducted*, but that the cases cited in the opinion are all cases under the Bankruptcy Act, all of which follow the construction placed upon that act by Judge Cochran of the Eastern District of Kentucky in Roszelle Bros. v. Continental Coal Corporation, 235 Fed. 342, which was approved and affirmed in Continental Coal Corporation v. Roszelle Bros., 242 Fed. 243, and both of which courts applied to the facts of that case a rule that is the very opposite of that for which said bankruptcy cases are cited, and that is applied in the Colorado Interstate Gas case, supra, as being applicable to the issue presented therein for determination.

We respectfully suggest that the opinion of Judge Cochran, which is followed by all of the other bankruptcy cases that are cited in the Colorado Interstate Gas case, casts an unbroken light upon and altogether dissipates the very broken light that is cast by the opinion in the Colorado Interstate Gas Company case in the following, among other, respects:

As originally enacted, the Bankruptcy Act of 1898 made no provision for bankrupt proceedings by or against corporations. It provided that the district courts shall have power

"to adjudge persons bankrupt who have had their principal place of business, resided, or had their domicile within their territorial jurisdiction for the preceding six months or the greater portion thereof," etc. (Section 2 of the Bankruptcy Act (Title 11, U. S. C. A. Section 11.)) Later the act was amended by provision that the word "persons" shall include corporation *except* where otherwise provided. (Subdivision 19 of Section 1 of the same act.). And general jurisdiction was vested in all Federal District Courts over the subject matter of bankruptcy proceedings.

A corporation was a party to the proceeding before Judge Cochran. The head office of the corporation was in Tennessee, where its main stockholders and most of its officers and directors, who had general direction and supervision of the business, resided, and where its financial business was conducted. The business of the corporation was private industrial business that consisted in coal mining and shipping operations, and nearly all of its coal lands were in the Eastern District of Kentucky. The question to be decided was whether the *venue* of the proceedings was in Tennessee or Kentucky, and called for a contruction of the provisions of the Bankruptcy Act and a decision of the question whether the "principal place of business" of the corporation had been in Tennessee or Kentucky for the preceding six months or greater part thereof. In view of the ambiguity of the venue provision of the amended Bankruptcy Act in its application to corporations, Judge Cochran considered the old Bankruptcy Act of 1867 as being in *pari materia*, and after having stated the facts of the case in hand, quoted at length from Judge Woodruff's opinion In re Alabama and C. R. R. Co., Fed. Cas. No. 124, that construed that act which fixed the district in which the *debtor* "*had* resided or *carried on* business" as that in which bankruptcy proceedings could be instituted thereunder. Plainly that act contemplated the place where the principal industrial business of the bankrupt debtors had been "carried on" during the preceding time required by the act, and had relation to the place or places where such business or businesses had been carried on or actually transacted or conducted during the time specified, as distinguished from the permanent principal place of business in the states of their creation which quasi-public corporations that are engaged in interstate commerce must have and maintain therein

in order to have any legal or valid existence at all for all purposes or suing and being sued, as shown hereinbefore. Moreover, no question respecting the regulation of interstate commerce was involved in that or any other of said bankruptcy cases. So, construing said bankruptcy acts together, Judge Cochran said:

> "There is no reason to think that the word 'business' in the present act has any different meaning from what it had in the Act of 1867. The change in provision was brought about no doubt by the consideration that a person may *carry on* business in several districts in the meaning thus given to that word, and it was desired to limit the jurisdiction of *bankruptcy* proceedings to the district which was the principal place of *so* doing. * * * If this restricted meaning is to be given to the word 'business' in the present act, then all that is to be considered in determining its principal place of business is where did it mine and sell its coal; and if it mined and sold in different places, which of these was the *principal*. All the rest of the business transacted by it was merely incidental thereto as the referee in the case of In re Elmira Steel Company, supra, expressed it, that is the 'principal place of the *principal* business' that determines jurisdiction."

Judge Cochran held upon the facts of that case that the *venue* was in Kentucky, where the coal was produced and shipped, and not in Tennessee, where the *head* office of the company was located and from whence the business was directed and supervised, and the matter was one over which all Federal District Courts had general jurisdiction. For these reasons we respectfully suggest that it will not only be seen from the opinion in the Colorado Interstate Gas Company case and the record herein that the actual operation, transaction, or conduct of the business of producing and transporting natural gas in interstate commerce by said companies, respectively, was not within the circuit wherein the proceedings for review were instituted in either case, but that the bankruptcy cases that were relied on by the Tenth Circuit Court of Appeals and that are cited to support jurisdiction by the petitioners herein actually refute in the most emphatic manner the very proposition to support which

they have been cited. In truth and fact it actually appears in the most affirmative manner by the purported jurisdictional averments of the petitions for review herein that all the gas that is transported in interstate commerce by the petitioners is produced, gathered in and transported from the State of Texas, without the Tenth Circuit of the United States. For such reasons we respectfully suggest that the bankruptcy cases cited in support of the decision in these cases demonstrate in the most affirmative manner that in matter of both fact and law the Circuit Court of Appeals for the Tenth Circuit was clearly without a semblance of jurisdiction to hear and determine the proceedings for review over which it so assumed jurisdiction.

We, therefore, respectfully submit that the assumption of jurisdiction over the subject matter of the petitions for review herein was manifest error that resulted from acceptance of the definition of the term "principal place of business" that is contained in the National Bankruptcy Act for the determination of the *venue* in such proceedings in said district courts, all of which are vested with general jurisdiction over the subject matter of all such proceedings *in rem* and which are governed in each particular instance by the particular facts of the case, when the "principal place of business" that is defined by said Section 19(b) has relation only to proceedings *in personam*, jurisdiction over the subject matter of which is expressly limited to the territorial jurisdiction of Circuit Courts of Appeals for the particular circuit of the United States "wherein the natural gas company to which the order relates is located or has its principal place of business;" and because both the location and the principal place of business of such a company, as a matter of law, can "only be in the state by which it was created," upon which such companies depend for, and wherein alone they can have, any legal existence, home, residence, domicile, citizenship, habitation, location, principal office, or principal place of business, for all of the reasons hereinbefore set forth, said Tenth Circuit Court of Appeals violated the commerce clause of Section 8, of Article I and the due process clause of the Fifth Amendment of the Constitution of the United States (Pennoyer v. Neff, 95 U. S. 714; 12 C. J. 1225, Section 1001; Robertson v. Railroad Labor Board, 268 U. S. 619 45 S. Ct. 621), the unambitious language of Sec 19(b) of the Natural

Gas Act, and the uniform interpretation that has been given to that language by this Court and the courts of this country in general.

VI.

THE IMPOUNDING ORDER OF THE CIRCUIT COURT OF APPEALS SHOULD AT THIS TIME BE CONSTRUED AND THE DISTRIBUTION OF THE MONIES IMPOUNDED THEREUNDER ORDERED IN ACCORDANCE WITH THE TERMS THEREOF AS CONTEMPLATED BY THE NATURAL GAS ACT.

It appears upon the face of the stay order pending review, under which said moneys are impounded, that the same was entered on May 16, 1942, upon the prayer of a petition filed by the Colorado Interstate Gas Company with said Court on April 20, 1942, when there was then pending before the Federal Power Commission a petition for rehearing which had not been determined (R. V. 1, P. 118). The terms of said stay order are in substance that as surety, and solely in lieu of bond, said moneys were to be deposited under an escrow agreement to be approved by the court, or any Judge thereof upon the following conditions:

1. The petitioner, Colorado Interstate Gas Company, shall pay or cause to be paid to the purchasers of Natural Gas under its rate schedules FPC 1-9, inclusive, referred to in said order of the Commission, as their several interests may appear, the amounts representing the reduction required by said Commission's order; and

2. The amounts so deposited shall * * * remain on deposit as provided in said order and in said escrow agreement, "subject, however, to the further order or orders of this court, to be returned to such ultimate gas consumers or persons to whom the court shall find the same should be returned as contemplated by the provisions of the Natural Gas Act." (R. V. 1, P. 118.)

It also appears on the face of the order entered in said cause on July 8, 1944; (R. V. 8, P. 5095) that said original stay order under which said moneys were to be deposited was continued on the terms and conditions therein set forth until the final disposition of said cause in this Court.

Notwithstanding said original stay order was improvidently entered without authority before the administrative remedy prescribed by the Natural Gas Act was exhausted, (Leebern vs. U. S., 124 Fed. 505; Myers vs. Bethlehem Ship Building Corporation, 303 U. S. 41; 58 Sup. Ct. Rep. 958), it was entered and continued upon the voluntary request of the Colorado Interstate Gas Company who is presumed to have invoked the entry and continuance thereof with full knowledge of the law of the subject. And, we respectfully submit, that the law applicable to the facts shown by this record is as follows:

1. The primary purpose of Congress in passing the Natural Gas Act was to protect ultimate consumers of gas from excessive prices, (Federal Power Commission v. Hope Natural Gas Company, 320 U. S. 591, 510, 512).

2. As stated in the opinion of the Tenth Circuit Court of Appeals, (142 Fed. 2(d) 947, 948, 949) and as shown by the original Memorandum of Stipulations of the joint adventurers who were the prime movers by whom this so-called "integrated system" was initiated and who are primarily interested in the petitioners herein:

> "The primary objectives of the contracting parties, as expressed in their agreement, were the acquisition of natural gas properties in the gas field, the construction of a pipe line from the field to the City of Denver via Pueblo and Colorado Springs, the sale and delivery of natural gas at the city gate of Denver and other cities, and supplying of natural gas to Colorado Fuel and Iron Company at Pueblo * * * Under the terms of the contract * * * Cities Service, through its subsidiaries, was to obtain a franchise and rate ordinance in Denver and Pueblo, respectively, for the sale of natural gas, and convert the artificial distribution plants then in use in such cities into natural gas distribution plants * * * Franchises and rate ordinances were obtained in Denver and Pueblo."

In pursuance of Section 265 (277 of 1927 Edition) and Section 268 (280 of 1927 Edition) of its charter, a franchise and rate ordinance were granted to the Public Service Com-

pany of Colorado (the subsidiary of Cities Service) by this respondent, which, as a party thereto, is the real party in interest therein. International Ry. Co. v. Mann, 224 N. Y. 83; 120 N. E. 153:

> "The city is the real party in intetrest to the agreement. The individual inhabitants are not, nor can they become parties thereto. They merely have the benefit of it while it remains in force * * *
> "If we look to the substance of things we must conclude that the common rights of the inhabitants of the city, secured through the agency of the city officials, are rights of the city."

The City and County of Denver is both a municipality and a "State Commission" within the meaning of the Natural Gas Act, being authorized by Article XX of the Constitution of Colorado, and its charter to regulate the charges for service by public utility corporations.

The monies that are on special deposit in the banks of Denver were deposited and are being deposited by the petitioner under its agreement as aforesaid, and are now being held in trust "subject to the further order or orders of the Court, to be returned to the ultimate consumers of gas or such persons as the Court shall find should receive the same in contemplation of the provisions of the Natural Gas Act."

And the rights of the city in respect of such a fund are stated by this Court, as follows:

In re Engelhard, 231 U. S. 646, 651:

> "It was in consequence of the motion of the city that the telephone company agreed to keep account of charges in excess of the ordinance rates, and, if they should finally be decided to be illegal, to pay into court the excess sums for distribution among its subscribers. It was the representative of all interests to provide for the creation of the fund; it is properly the representative of all interests to see to its proper distribution. This is a necessary deduction from the cases."

WHEREFORE, in consideration of all the foregoing, this respondent contends:

1. That the provisions of the Natural Gas Act and said stay order and escrow agreement contemplate the return of said impounded moneys to said ultimate gas consumers. (R.V.I. pp 115-119).

2. That they are of right entitled thereto, in equity and good conscience, as moneys had and received by the Colorado Interstate Gas Company for their benefit; and are the equitable owners of a primary right thereto.

3. That this respondent, as their legal representative, instituted these proceedings for the benefit of its said inhabitant gas consumers as well as in its own behalf, and is the real party in interest, legally authorized and entitled to receive said moneys for distribution under the further order or orders of said Circuit Court of Appeals at the costs of said petitioners, without diminution or loss of any part of the principal or interest thereon, in accordance with the conditions of said stay order wherein it is expressly provided that said Company shall pay or cause to be paid "all costs which may be adjudged against it should said order of the Commission, as amended, be sustained." (R.V.I. p. 118).

4. That, although said Circuit Court of Appeals had no jurisdiction over the subject matter of said proceedings,

> "Still, this court has full jurisdiction * * * to reverse the action of that court and * * * to remand the cause and give directions to that effect, and also, to direct that a writ of restitution issue to the proper parties."

Morris v. Coton, 8 Wall. 510, 512;

Northwestern Fuel Co. v. Brock, 139 U.S. 216;

U.S. v. Morgan, 309 U.S. 183, 197, 198;

Doggett v. Johnson, 79 Mont. 499; 257 Pac. 267, 268;

Am. Con. Tire Co. v. O'Malley, 342 Mo. 139; 113 S.W. (2d) 795, 804;

Masser v. London, 106 Fla. 474; 145 So. 72, 78, 79;

So. Railway Co. v. Tift, 206 U.S. 434; 51 L. Ed. 1124.

Ex parte Morris and Johnson, 9 Wall. 605.

5. Under the terms of said stay order and escrow agreement said petitioner is bound for the repayment of said moneys, with interest from the dates of all payments to it of overcharges.

Arkadelphia Milling Co. v. St. Louis Southwestern Railway Company et al., 249 U. S. 134,

Ex parte in the Matter of Lincoln Gas and Electric Company, Petitioner, 256 U. S. 512.

Respectfully submitted,

CITY AND COUNTY OF DENVER,

By MALCOLM LINDSEY,

SUPREME COURT OF THE UNITED STATES

October Term, 1944.

No.

CANADIAN RIVER GAS COMPANY, a Corporation,
PETITIONER,

v.

FEDERAL POWER COMMISSION, CITY AND COUNTY OF DENVER, COLORADO, PUBLIC SERVICE COMMISSION OF WYOMING, COLORADO-WYOMING GAS COMPANY, PUBLIC SERVICE COMPANY OF COLORADO, and COLORADO INTERSTATE GAS COMPANY, RESPONDENTS.

PETITION FOR WRIT OF CERTIORARI TO THE UNITED STATES CIRCUIT COURT OF APPEALS FOR THE TENTH CIRCUIT.

The petitioner herein respectfully prays for a writ of certiorari to review the judgment of the United States Circuit Court of Appeals for the Tenth Circuit, affirming an order of the Federal Power Commission under the Natural Gas Act of 1938, which order reduced the rates or charges for natural gas charged by petitioner in the amount of $551,000 annually for natural gas sold to Colorado Interstate Gas Company, and the amount of $10,000 annually for natural gas sold to Clayton Gas Company.[1]

[1] This petition is being filed simultaneously with a like petition by Colorado Interstate Gas Company, and the two petitions are made on a joint printed record in the Circuit Court of Appeals.

OPINIONS BELOW.

The opinion of the Circuit Court of Appeals (R., V. 8, 5066-5094) is reported in 142 Fed. (2) (Adv. Op.) p. 943. The opinion and order of the Federal Power Commission can be found at R., V. 1, 140-195; 43 P.U.R. 205. (n. s.)

JURISDICTION.

The judgment of the Circuit Court of Appeals was entered on July 8, 1944. (R., V. 8, 5094) The jurisdiction of this Court is invoked under Section 240(a) of the Judicial Code, as amended by the Act of February 13, 1925, and Section 19(b) of the Natural Gas Act.

STATUTE INVOLVED.

The pertinent provisions of the Natural Gas Act of 1938 (52 Stat. 821; 15 U.S.C. Sec. 717) are set forth in Appendix A, *infra*. (pp. 45-48)

ABBREVIATIONS USED.

For the sake of brevity the following abbreviations will be used in this petition:

"R." for the printed Record filed herein, and "V" for the "Volume" of the Record, followed by the page number in the Record to which reference is made.

"Circuit Court" for "United States Circuit Court of Appeals for the Tenth Circuit."

"Commission" for "Federal Power Commission."

"Act" for "Natural Gas Act of 1938."

"Canadian" for the petitioner, "Canadian River Gas Company."

"Colorado Interstate" for "Colorado Interstate Gas Company."

"Southwestern" for "Southwestern Development Company."

"Standard" for "Standard Oil Company (New Jersey)."

"Cities Service" for "Cities Service Company."

"Cost Contract" for the Agreement dated as of January

3, 1928, between Canadian and Colorado Interstate covering the purchase and sale of gas at cost under the terms of which petitioner has been ordered by the Commission to reduce its rates or charges in the amount of $551,000 annually.

"Natural Gas Pipeline case" for *"Federal Power Commission v. Natural Gas Pipeline Company,"* 315 U. S. 575.

"Hope case" for *"Federal Power Commission v. Hope Natural Gas Company,"* 320 U. S. 591.

QUESTIONS PRESENTED.

As will be shown more fully in the Statement of the matters involved in this petition, which follows hereinafter, the questions presented are:

1. Whether the Circuit Court, after correctly holding that the Commission has no rate regulatory jurisdiction over Canadian's production and gathering properties, facilities and business, erroneously concluded and ruled that the Commission in this case did not exercise such prohibited jurisdiction.

2. Whether, even assuming, *arguendo,* that the Commission has rate regulatory jurisdiction over Canadian's production and gathering properties, facilities and business, the Commission can, consistently with the Fifth Amendment to the Constitution of the United States, the requirements of the Act, and the decisions of this Court in the Natural Gas Pipeline, Hope and other cases, limit Canadian generally to a return only on the "wildcat" or original cost of its gas leaseholds to predecessor companies prior to discovery and development over 20 years ago, to the exclusion of all evidence of value, market or otherwise, the result of this procedure being, among other things, the inclusion in the Commission's rate base of a substantial block of Canadian's most valuable leaseholds at zero valuation and a still larger block of valuable leaseholds at only 10¢ per acre valuation.

3. Whether, even assuming, *arguendo,* that the Commission has rate regulatory jurisdiction over Canadian's production and gathering properties, facilities and business,

and further assuming, *arguendo,* that it is proper in this case to include Canadian's leaseholds and wells in the rate base on the basis of original cost, the Commission can, consistently with the Fifth Amendment to the Constitution of the United States, the requirements of the Act, and the principles announced by this Court in the Natural Gas Pipeline, Hope and other cases, disallow and eliminate more than $3,000,000, plus interest during construction paid thereon, from the amount actually invested by Canadian in its original acquisition of production properties in about 1928 solely upon the ground that the sum so eliminated allegedly represented a profit between affiliated companies, and, therefore, formed no proper part of the cost of said properties, where the Record clearly demonstrates that the transaction resulting in the acquisition of said properties was not between affiliates and that the price paid therefor was not excessive.

4. Whether the Commission has the power, consistently with the Fifth Amendment to the Constitution of the United States and the provisions of the Act, to abrogate and nullify the cost reimbursement provisions of Canadian's Cost Contract covering the sale of gas to Colorado Interstate, in view of the fact that said Contract had been entered into long prior to, and had been substantially performed at the time of, the adoption of the Act; and if it be held that the Commission has such power, then whether the Commission has exercised such power in an arbitrary and capricious manner by abrogating and nullifying the cost reimbursement provisions of said Contract, while at the same time leaving Canadian with the impossible task of performing all obligations of that Contract which give rise to the necessity for full cost reimbursement, including obligations over which the Commission has no jurisdiction.

5. Whether the Commission acted erroneously, arbitrarily and capriciously, and without support of substantial evidence, in determining the life of Canadian's gas reserves to be 53 years from December 31, 1939, and in computing Canadian's depreciation and depletion allowances on said assumed life, where the uncontradicted evidence will support a finding of not more than 27 years from said date.

6. Whether the Commission erroneously, arbitrarily and capriciously, overstated Canadian's annual income available for return in an amount of not less than $114,000, which sum constitutes a part of the reduction made by the Commission in its rate reduction order, and therefore deprives Canadian of this sum annually, in violation of the Fifth Amendment to the Constitution of the United States, the provisions of the Act, and the decisions of this Court.

7. Whether the Commission can, consistently with the Fifth Amendment to the Constitution of the United States and the requirements of the Act, refuse to allow Canadian a sum over and above normal depreciation on properties in place, which will be sufficient to enable Canadian to make necessary interim replacements of property which will be required long before the end of the 50-year service life period adopted by the Commission.

8. Whether the Commission can, consistently with the Fifth Amendment to the Constitution of the United States and the provisions of the Act, reduce the rates and charges of Canadian on that part of its natural gas sales to Colorado Interstate which is not sold by the latter for ultimate distribution to the public but is sold by it directly to its industrial customers; furthermore, independent of the above question, whether the Commission erred in making no separation or allocation as between Canadian's properties devoted to intrastate sales in Texas and its properties devoted to interstate sales, or as between the properties of Canadian and the properties of Colorado Interstate, and in using in lieu thereof a substitute method of allocation of cost of service which results in burdening non-regulable gas with costs actually chargeable against regulable gas, in violation of the Fifth Amendment to the Constitution of the United States and the Act.

9. Whether the Commission's rate reduction order, when viewed as a whole, can be sustained as being just and reasonable, or in the public interest, in the light of the requirements of the Act and the "end result" and "rate impact" principles announced by this Court in the Natural Gas Pipeline and Hope cases.

STATEMENT.

Among other things, it is contended in this petition that the Commission's order, when viewed as a whole, cannot be sustained as being just and reasonable, or in the public interest, in the light of the requirements of the Act or the "end result" and "rate impact" principles announced by this Court in the Natural Gas Pipeline and Hope cases. Hence, a brief statement of the pertinent historical facts involved, taken from a printed record containing over 5,000 pages, is deemed imperative. For convenient reference purposes, appropriate headings have been incorporated from time to time throughout this Statement.

The Petitioner.

Canadian produces and gathers natural gas in the Texas Panhandle Field, which it subsequently transports and sells to Colorado Interstate at two points, i.e., (1) near Clayton, New Mexico, for resale to customers of Colorado Interstate in Colorado, and (2) near Gray, Oklahoma, for resale to Natural Gas Pipeline Company of America. Canadian also sells smaller quantities of gas to Amarillo Oil Company at the wellhead and along its pipe line system for resale in the State of Texas and to Clayton Gas Company for resale in the State of New Mexico. Canadian produces all gas which it sells from a block of gas leaseholds embracing approximately 300,000 acres in the Texas Panhandle Field, substantially all of which was acquired from Amarillo Oil Company in 1928 under circumstances hereinafter related. (R., V. 1, 143, 402) All of the issued and outstanding capital stock of Canadian has been at all times owned by Southwestern.

General History of Canadian's Gas Leasehold Properties.

Over 27 years ago (1917), a few ranchers and small businessmen residing in and about Amarillo, Texas, incorporated and organized a small corporation, called "Amarillo Oil Company," for the purpose of drilling a "wildcat" well for oil in what has now become the great Texas Panhandle Field in the State of Texas. (R., V. 5, 2837, 3040) At that time there had been no discovery of oil or gas within 200 miles of the proposed well location. (R., V. 7, 3673)

Consequently, the cost to Amarillo Oil Company of assembling the block of leases to be tested was purely nominal, except for drilling obligations.

After many unfortunate experiences, financial and otherwise, the "wildcat" test well was finally completed in the fall of 1918 as a gas well—the first commercial producer of either oil or gas in the Texas Panhandle Field. From that successful "wildcat" beginning, the field has been subsequently developed by the drilling of successive test wells until it now contains 1,500,000 proven acres on which there are located approximately 1,650 wells producing gas only, and approximately 4,200 wells producing both oil and gas. (R., V. 1, 409) Canadian's acreage produces no oil.

In 1924 Southwestern became the owner of all the capital stock of Amarillo Oil Company. In the meantime, Amarillo Oil Company had acquired additional blocks of leaseholds in the field, and its total holdings were then approximately 300,000 acres. Substantialy all of such leaseholds were likewise granted for oil exploration at a time when the acreage embraced therein was classified as "unproven" and valued accordingly. Additional test wells were drilled on this acreage most of which proved to be substantial gas producers, although some resulted in dry holes.

Amarillo Oil Company had no market at that time for its gas production, except for relatively small sales *at the wellhead* for the City of Amarillo, Texas, and vicinity, and one industrial sale at a plant near Amarillo. It had one well with a capacity substantially in excess of the quantity required to supply its entire available market. (R., V. 1, 459)

Added to the lack of adequate markets, the gas properties and investments of Amarillo Oil Company were threatened at that time with still another menace. Tremendous volumes of gas in the field were being blown and wasted in the air, to the extent that it became a national scandal. (R., V. 7, 3673) Enormous quantities of gas were being consumed by carbon black plants and natural gasoline plants. The seriousness of the situation was ultimately recognized by the Texas Legislature, which enacted new legislation to

control the wastage of gas, as well as its use for carbon black purposes. (R., V. 7, 3675-3676)[2]

It became obvious that the Company could not realize upon its extensive gas properties unless new markets of a substantial character were developed promptly. There were then no long-distance pipe lines connected to the field. Pipe line markets in the immediate vicinity of the field were either occupied or too small to be attractive, and it seemed advisable to look for markets at greater distances. (R., V. 1, 402)

Origin of Denver Project.

The transportation of gas by pipe line over long distances was in its infancy. Neither Southwestern nor any of its affiliated companies had had any previous experience in transporting gas over long distances; moreover, Southwestern and its subsidiaries lacked the necessary capital with which to construct such a pipe line. (R., V. 1, 402, 403) The City of Denver, located a distance of approximately 350 miles from the Texas Panhandle Field, and intervening territory, seemed to be the closest available market for natural gas in substantial quantities. (R., V. 1, 402) In 1926 Southwestern approached Standard Oil Company (New Jersey) regarding the construction of a pipe line project to Denver and intervening territory, because the latter had had a long and successful experience in operating natural gas projects in other areas, and was fully able to finance such a project. (R., V. 1, 403) Standard investigated the feasibility of the project with favorable results. Cities Service Company was then brought into the negotiations because its subsidiary, Public Service Company of Colorado, held a manufactured gas franchise in Denver, and another subsidiary company held a similar gas franchise in Pueblo, Colorado. (R., V. 1, 403)

The three parties, to-wit: Standard, which was experienced in operating long-distance pipe lines and had the ability to finance the same; Cities Service, which controlled important market outlets in Colorado through its subsidiaries; and Southwestern, which controlled substantial gas reserves.

[2]Thompson v. Consolidated Gas Utilities Corp., 300 U. S. 55.

in the Texas Panhandle Field through its subsidiary, Amarillo Oil Company, began negotiations which continued for almost a year and finally culminated in an agreement between the parties on April 5, 1927, for the construction of a pipe line to Denver and intervening points and the acquisition of gas leaseholds and wells owned by Amarillo Oil Company for the project. (R., V. 1, 403-416.)

Neither Standard nor Cities Service had any interest whatsoever in either Amarillo Oil Company or Southwestern on that date (April 5, 1927), prior thereto, or subsequent thereto. There was no corporate affiliation between any of the three participating companies which executed the contract of April 5, 1927. (R., V. 1, 460, 613-622) *As stated above, the contract was entered into only after long and continued arm's-length negotiations between the parties* (R., V. 1, 493-526)

The Denver Project agreement of April 5, 1927, between Standard, Cities Service and Southwestern (Ex. 1; R. V. 1, 381-400), known as the "Memorandum of Stipulations," sets out in considerable detail the terms and conditions under which the parties agreed to develop and participate in the project, but it is important here to point out briefly two of the principal obligations assumed thereunder by Southwestern.

Under this three-party agreement Southwestern obligated itself (1) to organize and incorporate a company (now Canadian), *separate and apart from its other companies and projects*, to which it would cause Amarillo Oil Company to convey, free of all debts, liens and encumbrances, all of Amarillo Oil Company's gas leaseholds, rights and wells in the Texas Panhandle Field at an agreed price of $5,000,000; and (2) to cause the company receiving such gas leaseholds, rights and wells to enter into a long-term contract to dedicate its gas reserves to the project and to sell gas to the principal project company (now Colorado Interstate) on a cost basis in consideration of the issuance by Colorado Interstate to Southwestern, as the nominee of Canadian, of 42½% of its authorized common stock with no par value and $1,000,000 par value of its authorized 6% preferred stock. (R., V. 1, 381-400)

Canadian's Purchase of Gas Leaseholds, Rights and Wells for $5,000,000.

The purchase price of $5,000,000, as negotiated and agreed to by Standard, Cities Service and Southwestern, for the gas leaseholds, rights and wells of Amarillo Oil Company, which was to form the foundation for the project, was advanced and paid to Amarillo Oil Company by Standard in two equal payments made in December, 1927, and January, 1928, which was prior to the incorporation of Canadian. (R., V. 2936) Pursuant to its obligation under the original three-party project agreement, Southwestern organized Canadian in February, 1928, *separate and apart from its other companies and projects,* and subsequently caused Amarillo Oil Company to formally transfer and convey its gas leaseholds, rights and wells to Canadian. There were no negotiations whatsoever between Canadian and Amarillo Oil Company. (R., V. 1, 455-456)

To finance the several obligations imposed upon Canadian under the three-party agreement of April 5, 1927, i.e., to acquire gas-producing properties, to drill wells, to construct gathering facilities and transmission facilities, and to pay the agreed purchase price of $5,000,000 for the gas leaseholds, rights and wells of Amarillo Oil Company, Canadian issued and sold to Colorado Interstate $11,000,000 principal amount of its 6% First Mortgage Bonds maturing in annual installments of approximately $600,000 through 1947. Out of the proceeds derived from the sale of its bonds to Colorado Interstate, Canadian repaid the $5,000,000 advance made by Standard to finance Canadian's purchase of gas leaseholds, rights and wells from Amarillo Oil Company. (R., V. 1, 406, 462; R., V. 2, 656-685)

Canadian's Cost Contract with Colorado Interstate:

Acting again in pursuance of the obligations imposed upon it under the terms of the three-party project agreement of April 5, 1927, Canadian, for the consideration hereinabove described, entered into a contract with Colorado Interstate as of January 3, 1928, to furnish Colorado Interstate with its natural gas requirements at cost over a period of years. (Ex. 16; R., V. 2, 711-780)

This particular contract is unusual and unique in many

respects. It is not the ordinary contract for the current purchase and sale of natural gas as a commodity, and it is not the ordinary contract that courts or regulatory bodies are called upon to consider when confronted with a challenge to the right of abrogation. Briefly, the Cost Contract, and Canadian's related Trust Indenture (R., V. 2, 656-685) securing its bonds held by Colorado Interstate, require Canadian:

(a) to maintain and renew all its gas leasehold interests, to drill necessary wells, and to construct and maintain necessary pipe line and other facilities in order to supply Colorado Interstate's market at all times with its gas requirements;

(b) to produce, gather, transport and *sell* its gas to Colorado Interstate *at absolute cost* for a fixed period of 20 years, and so long thereafter as Colorado Interstate elects to buy;

(c) to dedicate its gas reserves and facilities to the service of Colorado Interstate's market, with no right to sell or otherwise dispose of its gas or gas properties to others for carbon black, industrial or any other purpose without the consent of Colorado Interstate (except for outstanding commitments to sell gas to Amarillo Oil Company to supply the Amarillo market)[3]; and

(d) to credit Colorado Interstate's cost of gas with any and all revenues, income or profits which it may receive from *any* source, and to continue to operate strictly as a non-profit company for the full term of the Cost Contract.

The cost of gas delivered by Canadian to Colorado Interstate under the Cost Contract is computed by deducting all outside revenues[4] received by Canadian (including sales of

[3] Canadian has two outstanding contract obligations to sell gas *at cost*, i.e., (1) to supply all markets of Colorado Interstate, as above described, and (2) to supply the Amarillo market of Amarillo Oil Company, which commitment was in existence long prior to the organization of Canadian and has certain preferential rights over all other markets of Canadian. (R., V. 1, 102; V. 2, 714, 715, 748)

[4] For example, in 1929 Canadian received in excess of $500,000 from the United States Government in final payment of the purchase price for certain helium-bearing leaseholds and wells of Canadian. Since the sum so paid represented revenues received by Canadian, it was likewise credited as a deduction against Colorado Interstate's current cost of gas under the Cost Contract. (R., V. 5, 2723; R., V. 1, 381-401)

gas to others) from the aggregate cost of producing and delivering all gas sold to all purchasers. Such cost includes interest on and amortization of Canadian's funded and other indebtedness, but does not include depreciation and depletion; or retirements.

Thus, it will be seen that for the services to be rendered to it by Canadian under the Cost Contract, Colorado Interstate agreed to underwrite and guarantee Canadian's net cost of operations after crediting profits or income from all other sources, but no more. Moreover, Colorado Interstate was granted direct and complete control over Canadian's costs which it is obligated to reimburse. Obviously, Canadian has not paid, and cannot pay so long as the Cost Contract is in effect, any dividends, earnings or profits in any manner to the owners and holders of its capital stock. This Contract, as above indicated, covers not only Canadian's transmission system, but also its production and gathering properties, facilities and business. Under the Cost Contract Canadian's receipts in any given year can never exceed its actual costs.

Canadian's Trust Indenture provides that in case of default thereunder, in addition to the usual remedies of foreclosure, etc., the Trustee may forthwith take possession, of, operate, manage and control the trust estate and, at its discretion, may sell the trust estate to the highest and best bidder "who will assume and perform the obligations of the company" under its Cost Contract with Colorado Interstate. The trust estate *must* be sold in one parcel and as an entity, and the purchaser or purchasers at any sale *must* be required to assume the performance of Canadian's obligations under its Cost Contract with Colorado Interstate.

The Commission's Findings and Order.

As indicated in the statement of questions presented, the Commission's "Order Reducing Rates" in this case, its opinion supporting such order, and the opinion of the Circuit Court affirming such order, raise several important questions which form the basis of this petition. Canadian contends that on a rate regulatory theory or any other theory the

Commission in its various findings and ultimately in its rate reduction order, committed numerous errors of law, constituting violations of the Act itself and which necessarily deprive Canadian of its property without due process in violation of the Fifth Amendment, and that viewed as a whole, the rate reduction order cannot be sustained under the "end result" or "rate impact" principles announced by this Court in the Natural Gas Pipeline and Hope cases. In so far as deemed pertinent at this time, the following additional statements are submitted with respect to the questions involved:

1. *Jurisdiction Over Production and Gathering.*

The Commission avowedly exercised rate regulatory jurisdiction over Canadian's production and gathering properties, business and facilities, notwithstanding the prohibitory provisions of the Act (Sec. 1, Appendix), contending that such action was proper because it was essential to its rate regulatory jurisdiction over interstate transportation and sale. (R., V. 1, 147) The Circuit Court, while ruling against the Commission on this contention, held that what the Commission had done in this case, in so far as production and gathering are concerned, did not constitute the prohibited rate regulation over production and gathering. (R., V. 8, 5073-5075) In this connection Canadian points out:

(a) that the Commission wholly disregarded substantial and uncontradicted evidence with respect to the prevailing market value of Canadian's gas at the wellhead in the field, as well as the prevailing market value of Canadian's gas at the termini of gathering operations in the field (R., V. 1, 140-195); and consequently there was no sound basis for the Commission's contention that rate regulation of production and gathering is necessary to accomplish rate regulation over interstate transportation and sale of natural gas as contemplated by the Act;

(b) that in arriving at its rate reduction order, the Commission determined a rate base which includes not only Canadian's interstate transmission system, but also its production and gathering properties (R., V. 1, 144-195; V. 5, 2717-2721); that in determining its rate base for Canadian's producing and gathering properties, the Com-

mission applied its so-called original cost or prudent investment theories, and in so doing totally ignored both the true value of such properties as well as the actual cost thereof to Canadian; that in its rate base for production and gathering properties, the Commission determined and included an allowance for working capital which it deemed sufficient to enable Canadian to carry on its production and gathering operations, and that likewise the Commission has purported to determine in its rate base for production and gathering properties what additional wells should be drilled and what additional gathering facilities should be installed in the future;[3]

(c) that after finding Canadian's total rate base to be $9,375,000 (R., V. 1, 187), of which approximately two-thirds represents production and gathering properties, (R., V. 5, 2717-2721), (even on the Commission's basis of determining a rate base), the Commission then found that Canadian was entitled to a return of 6½% per annum upon its total rate base (R., V. 1, 187), more than two-thirds of which, as above stated, is attributable to the hazardous business of discovering, exploring, developing and operating natural gas production properties;

(d) that the Commission has determined and made an allowance for Canadian's total annual operating expenses (including depreciation and depletion), the greater portion of which represents the cost of producing and gathering natural gas; (R., V. 1, 171; V. 4, 2341-2345)

(e) that after determining the total annual income of Canadian from all sources, the greater portion of which represents the cost of producing and gathering natural gas under its Cost Contract with Colorado Interstate, the Commission has deducted its determined annual operating expenses (mostly production and gathering) from such total income, and then, after making a return allowance of 6½% upon its determined rate base (mostly production and gathering), it has found an alleged excess income

[3]The Commission deducted $3,864,357 from Canadian's original cost, practically all of which is applicable to leaseholds. (R., V. 1, 149-151) The Commission, through a member of its staff, also offered detailed testimony with respect to the requirements for additional wells and gathering lines. (R., V. 5, 2530-2556)

being received by Canadian, which forms the basis for its rate reduction order; (R., V. 1, 187)

(f) that the Commission's order changes and abrogates the amount of compensation which Canadian is entitled to receive from Colorado Interstate under its Cost Contract, which compensation represents cost reimbursement to Canadian not only for the cost of current deliveries of gas to Colorado Interstate, but for the cost of performing various other services under the Cost Contract relating to Canadian's production and gathering properties and operations, such as the maintenance of leaseholds, the drilling of wells and the construction of gathering facilities as directed by Colorado Interstate; and finally,

(g). that the Commission has treated every element of Canadian's production and gathering properties, facilities and business in precisely the same manner as its interstate transmission properties, facilities and business, and has subjected every element of Canadian's production and gathering facilities to the same rate regulatory measures and procedures as Canadian's interstate transmission properties, facilities and business for the purpose of arriving at its ultimate conclusions with respect to rates and charges; and that if the Commission had sought directly and openly to assume and exercise full and complete rate regulatory jurisdiction over Canadian's producing and gathering properties, facilities and business, it could have done no more than it did do.

2. *Valuation of Canadian's Leasehold Properties.*

In considering Canadian's gas leasehold properties for rate base purposes, the Commission has limited its consideration to the original cost of acquisition, commencing with the leases upon which the first discovery well of Amarillo Oil Company was drilled in 1918. This practice of the Commission purports to limit Canadian generally to a return of 6½% per annum on only the "wildcat" value of its leaseholds while in the hands of predecessor companies, to the exclusion of all discovery, market or other values, notwithstanding the fact that prior to the acquisition by Canadian none of such gas leaseholds had produced gas for interstate transportation, and none of such gas leaseholds had been

devoted to a public use. (R., V. 1, 459; R., V. 5, 2861-2929) Canadian contends (even assuming rate regulatory jurisdiction) that original cost is not the proper basis for the inclusion of gas-producing leaseholds in a rate base, and that the Commission has erred in blindly following its original cost and prudent investment theories with respect to Canadian's gas leaseholds and in wholly disregarding uncontroverted evidence of value.

An analysis of the testimony of Commission witnesses, which the Commission adopted substantially (Ex. 146, Sheets 62-64; R., V. 5, 2717, 2721), shows that the Commission used the sum of $1,604,020.61 as the starting point for its findings as to original cost of or investment in Canadian's leaseholds as of December 31, 1939. Then, as appears from Paragraph 8 of the Commission's formal findings (R., V. 1, 186), a deduction of $653,681 was made for depletion. This means that Canadian's bare leaseholds have been included in the Commission's original cost rate base at a value of something less than $1,000,000.

In adopting this valuation for rate base purposes, the Commission has wholly ignored substantial and uncontradicted evidence that "the present market value of Canadian's leaseholds" (excluding wells) is the sum of $15,646,787.64. This evidence is the testimony of Canadian's witness Wallace. (Ex. 181; R., V. 6, 3181-3254)

The Commission has found that Canadian's recoverable gas reserves are 2,800,000,000 Mcf. (R., 1, 159) Reducing these figures so found by the Commission to its *value of the gas in place*, it appears that the Commission, in effect, has found the present value of the gas in place to be only 34/1000ths of one cent per Mcf. On a comparative basis, and using Wallace's $15,646,787.64 valuation, as applied to the Commission's finding of 2,800,000,000 Mcf. recoverable reserve, the value of the gas in place is approximately ½c per Mcf.

The original "wildcat" cost to Canadian's predecessors in interest of five important leaseholds, containing approximately 47,000 acres, allowed by the Commission is $4,244.24, which is less than 10c per acre. (R., V. 5, 2735, 2736, 3051) Three of these leases are included *at zero valuation*. The

present fair value of these same five leaseholds (exclusive of wells), as testified to by Wallace with supporting evidence as to such value, was $3,345,923. (R., V. 5, 3237, 3243) A similar situation exists in respect to the Commission's valuation of the remainder of Canadian's leaseholds. (R., V. 5, 3051)

The Commission has wholly ignored all evidence of the market value of gas at the wellhead in the Texas Panhandle Field as a measure of the value of said leaseholds. Canadian's General Superintendent Ford testified that the market value of gas at the wellhead in the Texas Panhandle Field is not less than 4c per Mcf. on a 16.4-pound pressure base, or not less than 3.6c per Mcf. on a 14.65-pound pressure base. (R., V. 6, 3255-3281) This testimony was corroborated by Wallace, and by Commission's Exhibit 168, Sheets 13 and 127. (R., V. 6, 3281.)*

3. *Canadian's Original Cost of Leasehold Properties.*

The Commission did not question the fact that Canadian had actually invested in its gas properties the sum of $14,648,821 as of December 31, 1939. It deducted from such actual investment, however, the sum of $3,370,817 on the ground that it represented "affiliated company profits," and in addition thereto the sum of approximately $245,000 interest during construction on such alleged profits. (R., V. 1, 149-151) Virtually the full amount of such deduction arises from the transaction heretofore related, in which Canadian acquired from Amarillo Oil Company all of the latter's gas leaseholds, rights and wells for the sum of $5,000,000 for the purpose of inaugurating the Denver Project in 1928. (See pp. 6-10, supra.) The Circuit Court,

*The Commission has found that Canadian's remaining recoverable reserves as of December 31, 1939, are not less than 2,800,000,000 Mcf.; that Canadian's future rate of production will be approximately 55,000,000 Mcf. (14.65-pound pressure base) per year; (R., V. 1, 159); and that on that basis Canadian's recoverable reserves will last for 53 years. The gross value of the 55,000,000 Mcf. to be so produced annually at 3.6c per Mcf. is $1,980,000. The Commission has found (R., V. 1, 171) Canadian's annual operating expenses to be $1,169,096, which includes gathering expense and transmission expense, as well as producing expense. Even if all of this expense, however, be attributed to the production of gas at the wellhead and be deducted from the gross annual value of $1,980,000, there remains a net income of $810,904 for Canadian's gas production in one year, which is almost as much as the Commission has allowed in the rate base for the total of Canadian's leaseholds for all time.

in upholding the Commission in this deduction, stated that the purchase price paid constituted a "synthetic inflation." (R., V. 8, 5082)

The Commission found that Amarillo Oil Company, commencing with its "wildcat" discovery well in 1918, had invested in the properties sold only the sum of $1,879,504, and that this sum should be further reduced by $128,534 by reason of an alleged profit of another predecessor company in a sale of property by it to Amarillo Oil Company (R., V. 1, 150), all of which resulted in a so-called original cost to Amarillo Oil Company of approximately $1,750,000, or $3,250,000 less than the sum actually paid by Canadian in cash for such properties.

Based upon the facts heretofore and hereinafter summarized, Canadian contends that the Record in this case establishes beyond question with respect to this transaction:

(a) that the amount of the purchase price to be paid for such properties, and other terms and conditions of sale, as well as the agreement to buy and sell, were determined and agreed to by the three non-affiliated organizers of the project after prolonged arm's-length bargaining, long before formal consummation of the transaction and even prior to the incorporation of Canadian itself;

(b) that the affiliation between Amarillo Oil Company and Canadian is only nominal, and does not exist in fact or in practice, and in any event did not arise until after the contract to buy and sell was consummated and the entire consideration paid;

(c) that the transaction was not a mere matter of intercompany book entries with no cash changing hands, as is ordinarily the case in a "write-up"; that the $5,000,000 in cash was actually paid by Canadian for its properties, and that such sum represented outside funds advanced by outside interests for that specific purpose;

(d) that the record does not even create an intimation that Canadian paid an excessive price for such properties, but that as a matter of fact the record demonstrates that such property is worth substantially more than the amount paid;

(e) that prior to acquisition by Canadian such properties had not been devoted to a public use or to the transportation or sale of gas in interstate commerce; and

(f) that the application of the Commission's original cost theories to production properties in this instance results in relegating Canadian to the provable cost of its predecessor companies, and denies Canadian any return on over $3,000,000 of its actual cash investment in production properties, as well as the right to recover such sum through the sale of its gas.

4. *Abrogation of the Cost Reimbursement Provisions of the Cost Contract.*

The Commission's purported rate reduction order in this case directs that Canadian's rates and charges "for the transportation and sale of natural gas for resale to Colorado Interstate Gas Company under its FPC Rate Schedule No. 1 shall be reduced by not less than $551,000 per year." (R., V. 1, 188) Canadian's FPC Rate Schedule No. 1, which was filed with the Commission by Canadian with a full reservation of its legal rights, consists of nothing but a copy of the Cost Contract. (R., V. 2, 709) Hence, the Commission's order on its face directs that Colorado Interstate's obligation to reimburse Canadian for its costs under the Cost Contract shall be reduced by the sum of $551,000 per year.

Cost reimbursement received from time to time by Canadian from Colorado Interstate, against which the Commission has aimed its reduction order, represents cost reimbursement to Canadian not only for the gas being currently delivered to Colorado Interstate as a commodity, but for the cost of performing various other obligations and services under the Cost Contract for the benefit of Colorado Interstate and its customers, some of which are clearly beyond the jurisdiction of the Commission, i. e., to acquire, maintain and develop a substantial block of gas leaseholds; to drill and operate wells; to construct and operate gathering facilities; to pay off funded debt in fixed amounts at fixed times; to sell gas to others only as permitted by Colorado Interstate, etc.

Under the operation of its Cost Contract, Canadian receives no revenue from Colorado Interstate except for the purpose of reimbursing it for actual costs incurred under the terms thereof. Its annual revenue is always in exact balance with its annual expenses. If Canadian is to retain its properties and remain solvent, it must receive currently sufficient funds to meet the cost of performing its obligations under the Cost Contract. The Commission by its rate reduction order has reduced the amount of revenue which Canadian is entitled to receive under its Cost Contract by the sum of $551,000 annually, but it did not change or abrogate any other provisions of said Contract or relieve Canadian of any of its obligations which give rise to the necessity for cost reimbursement.

The Cost Contract was made in 1928, long prior to the adoption of the Act, and was substantially performed at the time of the enactment of the Act. Canadian contends that the Commission's rate reduction order as applied to the Cost Contract is unworkable, and that it requires Canadian to do the impossible.

5. *Life of Canadian's Gas Reserves.*

The Texas Panhandle Field in which Canadian's gas reserves are located contains approximately 1,500,000 acres, of which approximately 500,000 acres produce sour gas that is not suitable in its natural state for pipe line use, and approximately 1,000,000 acres produce sweet gas (R., V. 1, 409; V. 7, 3672) Commission witnesses testified that Canadian owned gas leaseholds and gas rights on approximately 222,515 acres in the area of proven gas production (Table R., V. 6, 3669), or approximately one-seventh of the entire Texas Panhandle Field area.

Through the year 1940, pipe lines had utilized but little more than 20% of total field production. Canadian in 1939 produced approximately 41,000,000 Mcf. (R., V. 8, 4703), or about one-fourteenth of the total production for that year, and from the beginning of the field through 1939 Canadian produced approximately 340,000,000 Mcf. (R., V. 8, 4703), or about one-twenty-fourth of total field production, all

from approximately one-seventh of the productive acreage in the entire field.[7]

The record is uncontradicted that the Texas Panhandle Field is definitely a completely interconnected porous reservoir. (R., V. 8, 4753)

"Porous spaces throughout the Field are interconnected." (R., V. 7, 3741)

"It is theoretically possible that a single gas well could eventually drain substantially all of the gas out of the Texas Panhandle Reservoir." (R., V. 8, 4751)

"Drainage inevitably takes place in a gas reservoir comprising an interconnected porous system." (R., V. 8, 4752; also R., V. 8, 4753, 4754, 4755, 4756, 4758, 4760)

Every single witness who made a study of drainage in this case testified unequivocally that Canadian was suffering from drainage and that the life of its reserves for long-distance pipe line purposes could be measured only by the life of the Texas Panhandle Field as a whole. (R., V. 8, 4752, 4760, 4766, 4767) The Commission, however, totally ignored this uncontradicted evidence and computed the life of Canadian's reserves simply by estimating the recoverable reserves in place under Canadian's acreage *as of December 31, 1939*, and then dividing this figure by the estimated annual future production of Canadian. The Commission found from this calculation that Canadian's reserves had a life of 53 years from December 31, 1939. (R., V. 1, 159)

The life of Canadian's reserves for long-distance pipe

---

[7] The total production for the entire Texas Panhandle Field for the year 1939 and the cumulative field production from the beginning (16.4 pressure base) are as follows:

	Production in Mcf. 1939	Cumulative Field Production in Mcf. From Beginning
Gas used by gas pipe lines	222,299,905	1,887,199,782
Gas used by gasoline and carbon black plants	329,653,273	5,189,824,088
Casinghead gas not treated—blown in air	7,300,000	722,580,000
Gas blown in air and used in drilling wells, etc.	13,026,239	526,391,496
Total	572,279,417	8,325,995,366

(R., V. 7, 8, 4342, 4343, 4345, 4354)

line purposes based upon the highest estimate for recoverable reserves in the Texas Panhandle Field as a whole,* adjusted to a 50-pound abandonment pressure and divided by the future estimated annual production from the field as a whole, does not exceed 27 years from December 31, 1939. (R., V. 1, 157; V. 7, 3701; V. 8, 4638, 4646)

Canadian contends that in view of the uncontradicted drainage evidence in this case the Commission's determination of the life of Canadian's reserves was arbitrary and capricious and is wholly unsupported by the record, and therefore that such a determination is a nullity as a matter of law, as has been held in a long line of decisions by this Court. This erroneous and arbitrary action of the Commission necessarily resulted in an insufficient annual allowance for depreciation and depletion expense for Canadian as well as Colorado Interstate.

6. *Canadian's Revenues Available for Return.*

The Commission's order requiring Canadian to reduce its rates and charges by not less than $551,000 per year is based upon an alleged excessive return realized by the Company in the test year of 1939. In computing such alleged excessive return, Canadian contends that the Commission has erroneously, arbitrarily and capriciously, overstated Canadian's annual income available for return in an amount of not less than $114,000, which sum constitutes a part of the reduction ordered by the Commission, as is shown by the following:

(a) Under its Cost Contract, Canadian receives revenue only for its actual out-of-pocket cash expenditures, and therefore its accounts have been kept on a cash basis—not on an accrual basis. In computing Canadian's allowable costs, the Commission determined and restated Canadian's cash expenditures for the test year of 1939 on an *accrual* basis, and in so doing eliminated therefrom actual cash expenditures in the amount of $72,600, on the ground that such expenditures, although made in 1939, were applicable to the business of prior years. This sum is made up of two adjustments made by the Commission.

*This is the estimate of the Commission's Witness Hammer, which the Commission has said is too high. (R., V. 1, 157, 158)

Canadian actually paid federal income taxes during the year 1939 in the sum of $125,441. The Commission adjusted such taxes downward on an accrual basis to the sum of $66,403. (R., V. 1, 167; V. 6, 3432, 3457) This "adjustment" necessarily eliminated from Canadian's actual cash expenditures for that year the sum of $59,038 and understated Canadian's expense by that amount. Again, Canadian actually paid as rate case expense during the year 1939 the sum of $54,600. (R., V. 6, 3407, 3447) The Commission adjusted this cash expenditure downward on an accrual basis to $41,000 (R., V. 1, 166-167), and in so doing reduced Canadian's actual expenses for that year by $13,600. Assuming that this all was proper accounting on an accrual basis, the Commission, to be consistent, should also have determined and restated Canadian's revenues for the year 1939 on an *accrual* basis, which would have resulted in an offsetting deduction of $72,600 from such revenues, if revenues and expenses had been stated on a comparable basis, for the reason that Canadian's revenues are measured entirely in terms of cash required to meet current expenses. The Commission's failure to do so overstated Canadian's operating revenues by the amount of $72,600, and as a consequence thereof its net revenue available for return was overstated by a like amount.

(b) The Commission further overstated Canadian's income available for return by deducting from Canadian's 1939 operating expenses the sum of $15,056.24 because such sum was alleged to be a profit made by an affiliate (Amarillo Oil Company) through the extraction of gasoline from gas purchased by it from Canadian. (R., V. 6, 3425) Amarillo Oil Company purchases gas from Canadian for the Amarillo, Texas, market under a contract dated January 3, 1928, which provides expressly that Amarillo Oil Company shall receive title to and possession of such gas *in its natural state* as produced at Canadian's wells. As a part of Amarillo Oil Company's operation of transporting such gas from the wellhead to the City of Amarillo, the gas is processed for gasoline extraction by a non-affiliated company pursuant to the terms of a contract entered into by Amarillo Oil Company

over 20 years ago. The gas in question is produced, sold, transported, processed for gasoline extraction and consumed entirely within the State of Texas by parties which have nothing whatever to do with the operations of Canadian. The Commission's action in this respect resulted in an understatement of Canadian's actual operating expenses for the test year of 1939 in the amount of $15,056.24, and as a consequence thereof overstated Canadian's income available for return for that year in a like amount.

(c) The Commission failed to take into account increases in gross production taxes levied by the State of Texas subsequent to the termination date of the hearing, but long prior to the date of the rate reduction order, and in so doing failed to allow a minimum of $26,350 as a necessary operating expense. As a consequence thereof, the Commission has overstated Canadian's income available for return in this amount.*

7. *Depreciation as an Annual Operating Expense.*

The Commission allowed Canadian as an annual operating expense the sum of $80,969 for depletion and $157,774 for depreciation. (R., V. 1, 171). It allowed nothing for amortization as such. On this basis Canadian will accrue in its depreciation and depletion reserve during the remaining physical service life of its properties (38 years, as found by the Commission) the total sum of $9,072,234, plus accrued depreciation and depletion of $2,134,629 from 1928 to 1939, inclusive, (as determined by the Commission, R., V. 1, 164), or a total sum of $11,206,863, which is less than Canadian's original cost as of December 31, 1939, and capital additions to December 31, 1941, in the amount of

*Canadian in the year 1939 paid a gross receipts tax or gas production tax on the natural gas it produced in the sum of $34,220.09, (R., V. 6, 3457), which tax was computed on the basis of 3% of the value of the gas at the well, less 2% for gas loss, being net tax of 2.96%. (Chap. 495, Art. 4, Sec. 8, 3rd Called Session of the 44th Texas Legislature.) This tax act was amended, effective May 1, 1944, after the close of this hearing, but long before the Commission handed down its opinion on March 18, 1942. The new Act provided for a tax of 5.2%. (H. B. 8, Chap. 184, Acts of 47th Texas Legislature, Regular Session, 1941, p. 269.) The Commission allowed as an operating expense the gross receipts tax paid for 1939 and gave no effect to the increase in such taxes. The amended act increased Canadian's taxes, measured by the 1939 volume of production, approximately $26,350.

$11,356,387 (as allowed by the Commission, R., V. 1, 164). The salvage value will be negligible. (R., V. 3, 1757)

Based upon the most favorable testimony in the Record in support of the Commission's theory of depreciation (R., V. 8, 4944-4946), Canadian will be required to expend a minimum of $6,500,000 to make replacements of physical equipment which will have been worn out and retired prior to the end of the service life period adopted by the Commission.[10]

The average service life of virtually all of Canadian's physical property shown in footnote 10 below will have expired long before the termination of the 50-year average service life period which has been assigned by the Commission to the transmission system comprised mostly of main pipe line. It is reasonable to assume that one-half of the main pipe line will require replacement prior to the end of the assigned service life of 50 years, but if only approximately one-fourth of it is replaced, the total replacements for all types of physical property will aggregate approximately $6,500,000.

There has been no allowance made to accrue a fund for such replacements. They can only be made out of the depreciation reserve, which will leave such reserve inadequate by approximately $6,500,000 if Canadian's original cost as determined by the Commission (which is substantially less than its actual investment) is to be returned at the end of the life of the enterprise.

---

[10] The testimony given by a Commission witness which formed the predicate for the Commission's depreciation allowance, excluding non-depreciable items such as leaseholds, rights of way and other real estate, with adjusted book costs as determined by the witness, is briefly summarized as follows: (R., V. 8, 4944-4946)

Character of Property	Adjusted Book Cost 12/31/39	Service Life Years
Well Construction Costs and Equipment	$3,029,610.61	39
Field Lines	1,229,760.29	40
Other Field Facilities	78,225.47	Approx. 24
Gasoline Investment	350,239.94	" 30
Main Line Compressor Station	632,258.38	" 36
Bivens Camp	185,425.85	" 35
Transmission System	2,444,754.50	50
Dehydration Plant	41,332.45	" 26
Measuring Stations	18,923.32	" 32
General Property	175,677.93	4 to 35
Total	$8,186,208.74	

Canadian contends that under an unbroken line of decisions by the state and federal courts a gas company of limited life is entitled to a depreciation and amortization charge sufficient to keep its plant at 100% operating efficiency, as nearly as it is possible to do so, and in addition thereto, a sum that will refund the capital investment, including replacements, within the life of the business.

8. *Allocation Errors.*

The Commission made no allocation of Canadian's property with respect to gas sold by Canadian to Colorado Interstate for "direct sale" and gas sold by Canadian to Colorado Interstate for "resale"; and likewise it made no allocation between interstate and intrastate sales by Canadian. The Commission in determining the cost of service from a rate regulatory viewpoint considered all of the properties and operating expenses of Colorado Interstate, as well as all of the properties and operating expenses of Canadian, and applied its allocation formula to the combined properties and operating expenses of both companies, thus treating both companies as one composite system. (R., V. 4, 2317-2363)

In 1939, Canadian sold to Colorado Interstate at Clayton Junction for resale, 10,974,156 Mcf. and for direct sale and for Colorado Interstate's own use, which was not subject to rate regulatory jurisdiction of the Commission, 10,158,353 Mcf. Canadian also sold to Colorado Interstate for resale at Gray, Oklahoma, 20,783,301 Mcf. (R., V. 4, 2319), (all on a 14.65 pressure base). Approximately one-fourth of the gas sold to Colorado Interstate, therefore, was sold by it directly to industrial consumers. The Commission, however, made a blanket reduction of $551,000 with respect to all gas sold by Canadian to Colorado Interstate. In doing so the Commission completely ignored the fact that one-fourth of such gas was sold for direct sale to industrial consumers over which it had no jurisdiction, under the terms of the Act and completely ignored the fact that in determining the cost of service from a rate regulatory viewpoint it considered all of Canadian's and Colorado Interstate's properties as constituting one composite system.

Canadian contends that in view of the express provisions

of the Act, as applied to the facts in this case, the Commission has no rate regulatory jurisdiction over that portion of the gas sold by Canadian to Colorado Interstate which was, in turn, sold by the latter company to direct industrial consumers and not for resale. Canadian contends also, that since the Commission, in applying its rate making allocation formula made no allocation of properties as between Canadian and Colorado Interstate, but considered the two companies as constituting one system, it necessarily follows, in any event, that no reduction in rates should have been made as to the gas sold to Colorado Interstate for direct sale to industrial consumers. Such sales comprised approximately one-fourth of all the gas sold to Colorado Interstate. Canadian further contends that the failure to make any allocation of properties at all is contrary to the decisions of this Court, and unlawfully burdens non-regulable sales.

REASONS FOR GRANTING THE WRIT.

Question 1. Exercise of Prohibited Rate Regulatory Jurisdiction Over Canadian's Production and Gathering. Section 1 (a) of the Act declares "that the business of *transporting and selling* natural gas for ultimate distribution to the public is affected with a public interest, and that Federal regulation in matters relating to the *transportation* of natural gas and the *sale* thereof in interstate and foreign commerce is necessary in the public interest."

Section 1 (b) of the Act then provides that its provisions shall apply to such interstate transportation and sale "*but shall not apply to* any other transportation or sale of natural gas or to the local distribution of natural gas, or to the facilities used for such distribution or to *the production or gathering of natural gas.*" (Appendix, p. 45) (Italics supplied)

In both the Natural Gas Pipe Line case and the Hope case, this Court approved the actions of the Commission only because the Commission was found to have acted within the "ambit of its authority."

In the Hope case this Court stated:

"As we have said, the Act does not intrude on the domain traditionally reserved for control by state commis-

sions; and the Federal Power Commission was given no authority over 'the production or gathering of natural gas.'"

The Commission held, notwithstanding the prohibitory provisions of the Act, that it did have rate regulatory jurisdiction over Canadian's production and gathering properties, facilities and business, and that such jurisdiction was essential to its rate regulatory jurisdiction over interstate transportation and sale of natual gas, and avowedly the Commission exercised such assumed jurisdiction. (R., V. 1, 147) The uncontradicted evidence in this case establishes a commodity market value for Canadian's natural gas at the wellhead in the field and at its gathering system termini. (R., V. 6, 3255-3281) *The Commission could have used this commodity value of Canadian's gas as the starting point for the exercise of its delegated jurisdiction over interstate transportation and sale and avoided any usurpation of prohibited jurisdiction over production and gathering.*

The Circuit Court in the present case overruled the Commission in its contention that it does have rate regulatory jurisdiction over production and gathering but then ruled that what the Commission had done in this case did not constitute prohibited rate regulation of Canadian's production and gathering properties, facilities and business. (R., V. 8, 5075)

In view of the facts set forth in the Statement, it is submitted that the opinion and ruling of the Circuit Court to the effect that the various steps taken by the Commission in arriving at its rate reduction order, and the rate reduction order itself, do not constitute an exercise of prohibited rate regulatory jurisdiction over Canadian's production and gathering properties, facilities and business, are not consistent with, or supported by, the Record, and serve only as a convenient whitewash for a direct violation of the express provisions of the Act; that in holding that the action of the Commission in this case does not constitute an exercise of rate regulatory jurisdiction over Canadian's production and gathering properties, facilities and business, the Circuit Court has decided a federal question in a way not only in conflict with the facts and the Act, but also probably in conflict with the Hope and Natural Gas Pipe Line decisions

of this Court; that in so ruling the Circuit Court has decided an important question of federal law which has not been, but should be, settled by this Court; and likewise in so ruling, the Circuit Court has so far departed from the accepted and usual course of procedure, and has so far sanctioned such departure by the Commission, as to call for an exercise of this Court's power of supervision.

The question presented here is whether the Commission in the exercise of its rate regulatory powers can, without violating the prohibitory provisions of the Act, include production and gathering properties in its rate base; apply its original cost or prudent investment theories to such production and gathering properties for rate base purposes; determine operating expenses, depreciation and depletion for such production and gathering properties; abrogate the cost reimbursement provisions of a contract relating to such production and gathering properties; include such production and gathering operations in its cost of service allocation; determine what is a fair rate of return on its rate base which is primarily composed of such production and gathering properties, and, in fact, exercise every rate regulatory function which can be possibly exercised by a rate regulatory commission under an express grant of jurisdictional authority. It is submitted that the question thus presented is of great importance, not only to the natural gas industry as a whole and the Commission, but to the public as well. It is also a question which must necessarily arise in numerous cases in the future. A similar or related question concerning jurisdiction over production and gathering is presented to this Court in the petition for certiorari filed herein (October Term, 1944) in the case of *Panhandle Eastern Pipe Line Co., et al. v. Federal Power Commission, et al.*

Question 2. The Commission's Valuation of Canadian's Leasehold Properties. In avowedly exercising rate regulatory jurisdiction over Canadian's production and gathering properties, facilities and business in this case, the Commission has included Canadian's gas leaseholds in its rate base at original cost of acquisition, which results generally in limiting Canadian to a return of 6½% per annum on only the "wildcat" value of such leaseholds while in the hands of predecessor companies prior to discovery and development

over 20 years ago. In adopting this procedure, the Commission has wholly disregarded and excluded all evidence as to Canadian's actual original cost of such leaseholds, as well as all evidence as to the true value thereof, such as their fair market value, as established by uncontradicted evidence, and their value, as measured by the market value of Canadian's natural gas at the wellhead in the field, likewise established by uncontradicted evidence.

Neither the Commission nor the Circuit Court in their respective opinions gave any consideration or made any reference to the uncontradicted evidence in the Record establishing the value of Canadian's leaseholds. The Circuit Court in its opinion impliedly treated gas leaseholds as falling in the same category as ordinary physical property for rate base valuation purposes. It is Canadian's contention that even though original cost may be held to be the proper basis for inclusion of the ordinary classes of property in the rate base of a regulated utility, original cost (and particularly original "wildcat" cost to predecessor companies) is entirely inappropriate for rate base purposes when applied to gas leaseholds and cannot result in a fair valuation and return, either from the viewpoint of the owner of the leaseholds or of the public, and must necessarily deprive the owner of his property without due process in violation of the Fifth Amendment. The natural gas produced from a leasehold costing $1,000,000 has the same commodity value (and is of the same value to the consuming public) as natural gas produced from an adjacent leasehold costing $100,000, and the difference in the cost of the leaseholds cannot justify a return to the million dollar investor ten times larger than that granted to the $100,000 investor.

The Circuit Court, without discussing this question relating to gas leaseholds, stated that it felt bound to approve the Commission's original cost rate base because of the opinions of this Court in the Natural Gas Pipe Line and Hope cases. (R., V. 8, 5079-5081) It is submitted that, even assuming, *arguendo*, the Commission has rate regulatory jurisdiction over Canadian's production and gathering properties, facilities and business, the action of the Commission in including Canadian's leaseholds in its rate base at original cost of acquisition (in most instances to predecessor

companies), and the opinion of the Circuit Court affirming such action, are not justified by, but are in conflict with, the provisions of the Act; that the Circuit Court has decided a federal question in a way probably in conflict with the Hope and Natural Gas Pipe Line decisions of this Court, as well as a long line of earlier decisions of this Court, ending with the case of *Los Angeles Gas & Electric Corp. v. Railroad Commission*, 289 U. S. 287; that the action of the Commission in this respect, and the affirmance by the Circuit Court, deprive Canadian of its property in violation of the Fifth Amendment; that the Circuit Court has decided an important question of federal law which has not been, but should be, settled by this Court, and likewise has so far departed from the accepted and usual course of procedure, and has so far sanctioned such departure by the Commission, as to call for an exercise of this Court's power of supervision. It is of great importance, not only to Canadian and the natural gas industry as a whole, but also to the public, that the scope of the administrative powers of the Commission in this respect be finally determined. The "rate impact" or "end result" effect of the actions of the Commission and the Circuit Court in this matter is further referred to in connection with Question 9.

Question 3.. Canadian's Actual Original Cost of Leasehold Properties. It has been pointed out in Question 2, supra, that original cost is not the proper basis for inclusion of gas producing leaseholds in a rate base, even though it be assumed, *arguendo*, that the Commission has rate regulatory jurisdiction over such leaseholds. If it be further assumed, *arguendo*, that this contention is invalid and that original cost is the proper basis for inclusion of such leaseholds in a rate base, then the Commission in this case, with the affirmance of the Circuit Court, has arbitrarily and erroneously deprived Canadian of more than $3,000,000 of its *actual and legitimate original cost* of such leaseholds for the reasons set forth in the Statement, pp. 6 to 19, supra. This elimination of more than $3,000,000 of Canadian's actual cash cost and investment in gas-producing properties is arbitrary and therefore is condemned by an unbroken line of decisions of this Court.[11]

[11] Northern Pacific Ry. Co. v. Department of Public Works, 268 U. S. 39, 44-45.

There is no finding by either the Commission or the Circuit Court that Amarillo Oil Company had ever devoted the properties sold to a public use,[12] and a finding to this effect could not be sustained on the Record; but even if this were not true, still there is no basis in the Act, or in this Court's opinions in the Hope and Natural Gas Pipe Line cases, for the elimination from the so-called prudent investment rate base of any portion of the $5,000,000 actually paid by Canadian in cash for the gas producing properties purchased from Amarillo Oil Company. It is not even intimated that the consideration was excessive. The record supports a much higher figure as to its actual value.

This Court has said in the Natural Gas Pipe Line and Hope cases that the Commission is not restricted to any particular formula or combination of formulas in arriving at a rate base. These opinions, however, clearly contemplate that the formula or combination of formulas adopted by the Commission shall bear some reasonable relationship to value and to the admitted facts in any given case. This is clearly demonstrated in the concurring opinion in the Natural Gas Pipe Line case wherein it is stated: "The Commission has a broad area of discretion for selection of an appropriate rate base. * * * Various routes to that end may be worked out by the expert administrators charged with the duty of regulation. * * * *The decision in each case must turn on considerations of justness and fairness which cannot be cast into a legalistic formula.*" (pp. 606-607) (Italics supplied.)

The "legalistic formula" adopted by the Commission for inclusion of Canadian's leaseholds in its rate base has re-

---

Interstate Commerce Commission v. Union Pacific RR. Co., 222 U. S. 541, 547.
U. S. v. B. & O.S.W. RR. Co., 226 U. S. 14, 20.
Interstate Commerce Commission v. L. & N. RR. Co., 227 U. S. 88, 91.
Florida E. Coast Ry. Co. v. U. S., 234 U. S. 167, 185.
United States v. Abilene and S. Ry. Co., 265 U. S. 274, 288.

[12]The Commission does make an offhand reference, which hardly reaches the dignity of a finding, that Master Oil and Gas Company and Mission Oil Company (both predecessor companies of Canadian) had devoted their properties to a public use prior to the acquisition by Canadian. (Commission Opinion R., V. 1, 150.) This offhand statement, however, is not even supported by the record. Master Oil and Gas Company had never sold any gas from its properties prior to the acquisition thereof by Canadian (R., V. 5, 2801, 2802), and the record is entirely silent with respect to any sales by Mission Oil Company.

sulted in the assignment of a zero valuation to some of Canadian's most valuable leaseholds and a value of only 10 cents per acre to a still greater block of important leaseholds. The undisputed testimony in the Record demonstrates that these leaseholds were worth many millions of dollars, exclusive of the wells. Clearly the Commission's "legalistic formula" in this case does not meet any test of "justness and fairness."

It is submitted that the action of the Commission, and the affirmance of such action by the Circuit Court, in eliminating more than $3,000,000 of Canadian's actual cash investment in its gas producing properties from its rate base, and denying Canadian any return on such sum, as well as the right to recover such sum through the sale of gas, violates the provisions of the Fifth Amendment and the Act and is probably contrary to the decisions of this Court in the Hope, Natural Gas Pipe Line and other applicable cases hereinabove referred to. It is also submitted that the question here involved presents a federal question of great and far-reaching importance which has not been, but should be, settled by this Court; that the Commission in its action, and the Circuit Court by its affirmance of such action, have so far departed from accepted procedures as to call for an exercise of this Court's power of supervision.

Question 4. Abrogation of Cost Reimbursement Provisions of Canadian's Cost Contract. The pertinent provisions of this Cost Contract are summarized and the action of the Commission in abrogating the cost reimbursement provisions thereof are analyzed in the Statement supra, (pp. 10-12 and 19-20). While under the Contract Canadian's total revenues, can never exceed, but must always be in exact balance with, its costs, the Commission has purported to reduce the amount which Canadian shall be entitled to receive under the Contract by $551,000 annually, without relieving Canadian from any of its obligations under the Contract which render full cost reimbursement imperative. The effect of the Commission's order is that Canadian will be short $551,000 annually in the amount necessary to defray the cost of performing its obligations under the Contract.

The Circuit Court's affirmance of the Commission's action (R., V. 8, 5075-5078) is erroneous, deprives Canadian of its

properties without due process in violation of the Fifth Amendment, violates the provisions of the Act and is probably in conflict with the Hope and Natural Gas Pipe Line and other applicable decisions of this Court in that:

(a) The Circuit Court misconstrues the statement of this Court in the Natural Gas Pipeline case (p. 590), "but regulation does not insure that the business shall produce net revenues, * * *," as meaning that a rate reduction order can be sustained where it absolutely forecloses the possibility of net revenues;

(b) Any general power to abrogate contracts made prior to the adoption of the Act must be exercised in a manner consistent with the due process clause of the Fifth Amendment. *Monongahela Navigation Co. v. United States*, 148 U. S. 312; *United States v. Chicago, Milwaukee, St. Paul & Pacific R. R. Co.*, 282 U. S. 311; *Dubuque & Sioux City R. R. Co. v. Richmond*, 19 Wall. 173; *Great Northern Utility Co. v. Public Service Comm.*, 52 Fed. (2d) 802; *United States v. Seven Oaks Dairy Co.*, 10 Fed. Supp. 995;

(c) Passage of the Act did not automatically overthrow Canadian's Cost Contract and the rates and charges under that Contract could be changed only after an express finding of unreasonableness supported by substantial evidence. *Wichita Railroad & Light Co. v. Public Utilities Comm.*, 260 U. S. 48; *Allen W. Hinkle Dry Goods Co. v. Wichtson Industrial Gas Co.*, 64 Fed. (2d) 881. In this case the Commission's finding of unreasonableness of the rates under the Cost Contract is not supported by substantial evidence.

(d) The Circuit Court has misconstrued its judicial functions in this review under Section 19(b) of the Act and has affirmed the Commission without any analysis of the Cost Contract or the ultimate and inevitable effect of the Commission's action thereon.

(e) The action of the Commission, particularly in abrogating only the cost reimbursement provisions of the Cost Contract and leaving Canadian obligated to perform all the obligations of the Contract, but depriving it of the revenues necessary to such performance, is an arbitrary

and capricious exercise of any general power to abrogate contracts, in violation of the Fifth Amendment. *Nashville, Chattanooga & St. Louis Ry. v. Walters*, 294 U. S. 405; *Nebbia v. New York*, 291 U. S. 502; *Yick Wo v. Hopkins*, 118 U. S. 356.

The only attempted answer of the Circuit Court to Canadian's contentions is that Canadian received $5,000,000 initially in cash from Standard and that Southwestern acquired a portion of Colorado Interstate's common and preferred stock, and is entitled to participate in Colorado Interstate's net earnings. The Circuit Court then states: "Taking these and other factors into account, there is no basis for challenging the order on the ground that it exacts the impossible and is confiscatory." (R., V. 8, 5078) What the "other factors" are which the Circuit Court took "into account" cannot be ascertained from the Court's opinion. In any event, the Circuit Court's reasoning is definitely specious and its conclusions are clearly erroneous in that:

(a) Canadian, as a wholly-owned subsidiary of Southwestern which is kept separate and apart from the latter's other companies and projects in accordance with the original project agreement, did receive temporarily the benefit of a $5,000,000 cash advance by Standard to pay the purchase price for its gas leaseholds, rights and wells with which to commence the Denver Project, but that sum was paid to Amarillo Oil Company for such properties before Canadian was incorporated and the advance was subsequently repaid in cash by Canadian to Standard through Colorado Interstate out of the purchase price for Canadian's First Mortgage Bonds, which were issued and sold, in part, for that purpose; and

(b) The $5,000,000 purchase price can have no pertinency whatsoever to this question except upon the questionable theory that a portion thereof constituted a profit between affiliated companies, which contention is answered elsewhere. Even on such theory "profits of the past cannot be used to sustain confiscatory rates for the future." *Board of Public Utilities Commissioners v. New York Telephone Co.*, 271 U. S. 23, 30.

(c) In any event there can be no justification for a

theory that Southwestern, as the owner of less than one-half of Colorado Interstate's outstanding capital stock, should bear 100% of the burden of meeting deficits created by the Commission under Canadian's Cost Contract in connection with the production, gathering, transportation and delivery of gas for the benefit of Colorado Interstate.

The affirmance by the Circuit Court of the Commission's abrogation of the cost reimbursement provisions of Canadian's Cost Contract deprives Canadian of its property in violation of the Fifth Amendment and is in violation of the provisions of the Act. The Circuit Court, in affirming the Commission, has decided an important question of federal law which has not been, but should be, settled by this Court, and has so far departed from the accepted and usual course of procedure, and has so far sanctioned such departure by the Commission, as to call for an exercise of this Court's power of supervision. The opinion of the Circuit Court is in conflict with the applicable decisions of this Court and with the decisions of other Circuit Courts of Appeal hereinabove referred to.

Question 5. Life of Canadian's Reserves. This question presents a proposition of law. For the purposes of this petition, the accuracy of the various estimates of gas reserves and the methods employed as the basis of such estimates, are not attacked. Moreover, for the purpose of the argument, the very highest applicable reserve estimate is accepted.

Five witnesses in this case testified unequivocally and *without contradiction* that due to the effects of drainage the life of Canadian's gas reserves for long distance pipe lines could be measured only by a determination of the life of the field as a whole. Witnesses for the Commission made no definite study of drainage (R., V. 6, 3640-3641; R., V. 7, 3738-3739, 4002, 4042, 4045, 4072, 4074), and made no effort to refute such testimony.

The Commission ignored this uncontradicted testimony and computed the life of Canadian's reserves not by considering the life of the field as a whole, but by considering only estimated reserves in place under Canadian's acreage

and the estimated future production therefrom. It gave no consideration to the question of drainage from Canadian's acreage or to production from other portions of the interconnected reservoir. Had the Commission considered Canadian's recoverable reserves in connection with the field as a whole, its finding for the life thereof would have been not more than 27 years from December 31, 1939, instead of 53 years from such date, as found by the Commission. Twenty-seven years is the maximum life of Canadian's reserves based upon the estimate of total field reserves submitted by a Commission witness, which is the highest in the Record.

It is true that both the Commission and the Circuit Court agreed generally that drainage should be taken into account in making reserve estimates. This statement of principle, however, does not answer the question here presented. This question does not concern estimates of gas reserves in place, but is directed to the determination of the life of such reserves, which involves many additional factors. The method utilized by the Commission in computing the life of only one segment (Canadian's acreage) of an interconnected reservoir, where all of the gas can be produced by one well and where drainage is definitely present, finds no support in the Record but is affirmatively condemned by the Record.

Mr. Justice Brandeis has said:

> "An order based upon a finding made without evidence, or *a finding made upon evidence which clearly does not support it*, is an arbitrary act against which courts afford relief * * *." (Italics supplied.) *Northern Pacific Ry. Co. v. Dep't Public Works*, 268 U. S. 39, 44-45.

This same principle is also announced by other decisions of this Court.[13]

The finding of the Commission with respect to the life of Canadian's reserves, which finding resulted in an insuf-

[13] Interstate Commerce Comm. v. Union Pac. R. R. Co., 222 U. S. 541-547.
U. S. v. B. & O. S. W. R. R. Co., 226 U. S. 14, 20.
Interstate Commerce Comm. v. L. & N. R. R. Co., 227 U. S. 88, 91.
U. S. v. Abilene & S. Ry. Co., 265 U. S. 274, 288.
Florida E. Coast Ry. Co. v. U. S., 234 U. S. 167, 185.

ficient allowance for depreciation and depletion, and the failure of the Circuit Court to set aside such finding, is in conflict with the decisions of this Court hereinabove referred to.

Question 6. Canadian's Revenues Available for Return. It requires nothing but a few simple arithmetical computations to demonstrate conclusively that the Commission has overstated Canadian's annual revenues available for return by not less than $114,000, as is shown in the Statement. (pp. 22 to 24 supra) This overstatement is reflected in, and becomes a part of, the rate reduction ordered in exactly the same sum. Along with many other questions, the Circuit Court apparently dissolved this glaring error in its over-all conception of the "end result" and "rate impact" principles announced by this Court in the Hope and Natural Gas Pipeline cases. We submit that this is no answer to the question presented. Since there is no basis in the Record for the Commission's action in this respect such action was wholly arbitrary and, therefore, is condemned by, and is in conflict with, the applicable decisions of this Court,[14] including the Hope and Natural Gas Pipeline cases.

Question 7. Depreciation as an Annual Operating Expense. This question raises one of the fundamental distinctions between a regulated natural gas business of limited life and other regulated businesses having an unlimited life.

Various Circuit Courts of Appeal and other courts have recognized this distinction, and have held that a natural gas company is entitled to an annual allowance for amortization over and above the allowance for depreciation as such. This allowance must be sufficient not only to make necessary replacements and to keep the physical properties in 100% operating efficiency as nearly as it is possible to do so, but also to return to the company its total investment at

Interstate Commerce Comm. v. Union Pac. R. R. Co., 222 U. S. 541-547.
U. S. v. B. & O. S. W. R. R. Co., 226 U. S. 14, 20.
Interstate Commerce Comm. v. L. & N. R. R. Co., 227 U. S. 88, 91.
U. S. v. Abilene & S. Ry. Co., 265 U. S. 274, 288.
Florida E. Coast Ry. Co. v. U. S., 234 U. S. 167, 185.

the end of the life of the enterprise.[15] These decisions have been approved in principle by this Court.

The Commission completely ignored this principle and has allowed a sum that will not be sufficient to return the invested capital, even on the basis of the Commission's determination, at the end of the service life period fixed by it. It has made no allowance whatsoever to cover replacements in the amount of aproximately $6,500,000, which will be required during the life of the enterprise, as is shown in the Statement. (pp. 24 to 26 supra)

This question was likewise not discussed by the Circuit Court. The action of the Commission, and the Circuit Court's silent affirmance of the same are in conflict with the applicable decisions of other Circuit Courts of Appeal and of this Court, hereinabove referred to.

Question 8. Allocation Errors. Sections 1(a) and 1(b) of the Act provide only for the regulation of rates with respect to the transportation and sale of gas in interstate commerce "for ultimate public consumption." Approximately one-fourth of the gas sold by Canadian to Colorado Interstate is not sold for "ultimate public consumption," but for resale to direct pipe line industrial consumers. These sales are not now subject to regulation by the Commission or any other rate regulatory body. Such reduction, therefore, does not enable the Commission to reduce the rates of Colorado Interstate to such customers by a single penny. It is thus apparent that the reduction in the rates for such gas sold by Canadian to Colorado Interstate, which reduction is in excess of $137,500 per annum, not only serves no useful purpose whatsoever, but represents an attempt by the Commission to regulate transactions over which it has no jurisdiction.

---

[15] United Fuel Gas Co. v. Public Service Comm. of W. Virginia, 14 Fed. (2d) 209-11. (Affirmed without discussion of this point, 278 U. S. 322.)

United Fuel Gas Co. v. Railroad Comm., 13 Fed. (2d) 510, 518. (Affirmed without discussion of this point, 278 U. S. 300.)

Oklahoma Natural Gas Co. v. Corporation Comm., 90 Okla. 84; 216 Pac. 917, 923-924.

People ex Rel. Pennsylvania Gas Co. v. Public Service Comm., 204 App. Div., 73 (N. Y.)

Landon v. Public Utilities Comm., 242 Fed. 658. (Reversed on other grounds, 249 U. S. 236.)

This purported rate reduction is also erroneous, as well as inconsistent and contradictory, because the Commission in the development of its "allocation of cost of service" formula considered Canadian and Colorado Interstate as one composite system. The Commission made no effort to segregate transportation costs and determine such costs for each company as a separate entity. This being true, there is no basis in any event for the reduction in rates for gas sold to direct industrial consumers from a single composite system.

The Circuit Court overruled this contention without discussion. The action of the Commission and affirmance of such action by the Circuit Court are erroneous under the facts of this case, as shown in the Statement. (pp. 26-27, supra) The question presented raises an important question of federal law in determining the scope of the Commission's administrative powers under the Act, which will likely arise in other cases and which has not been, but should be, settled by this Court.

In the companion case Colorado Interstate elaborates on the additional contentions that the decisions of this Court require a separation of property, which the Commission and the Circuit Court admit was not done in this case; and that even if the Commission's "allocation of cost of service" is a valid substitute for the separation of the property itself and could be approved (which is denied), no "end result" formula such as was approved in the Hope case can possibly excuse the flagrant errors in its application in this case. In order to avoid repetition, reference is hereby made to the petition and brief of Colorado Interstate upon this subject and your petitioner relies upon the facts stated and the argument made therein.

Question 9. The "End Result" and "Rate Impact" Principles Announced in the Natural Gas Pipe Line and Hope Cases. In affirming the Commission's rate reduction order, the Circuit Court relies almost entirely upon the Hope and Natural Gas Pipeline decisions of this Court. Canadian submits that the Circuit Court's opinion is in conflict with such decisions, and that, when viewed as a whole, the Commission's order cannot be sustained as being

just and reasonable or in the public interest in the light of the requirements of the Act and the "end result" and "rate impact" principles announced by this Court in the Natural Gas Pipeline and Hope cases, where it appears from the Record that such order of the Commission, among other things, results in the following:

(a) The assumption of full and complete rate regulatory jurisdiction over production and gathering properties, facilities and business which has been expressly withheld by Congress;

(b) The absolute denial of actual cost, discovery, market and all other values of gas leaseholds for rate base purposes, except provable capital expenditures of predecessor companies commencing with the first "wildcat" or discovery well drilled over 25 years ago;

(c) The nullification of the cost reimbursement provisions of a Cost Contract entered into over 15 years ago for the purpose of dedicating and perpetuating substantial gas reserves and properties to the service of the Denver pipe line market *at cost* for a period of years, thereby leaving Canadian in an impossible situation to perform its contract obligations;

(d) The enforced default of Canadian not only in its Cost Contract obligations, but its funded debt obligations, notwithstanding the fact that Canadian is operated as a non-profit company and has not had, and will not have, any earnings or profits for distribution to its owners, so long as the Cost Contract remains in effect;

(e) An allowance for annual depreciation and depletion based upon a 53-year assumed life of Canadian's gas reserves, whereas the evidence will not support a finding of a life of Canadian's recoverable reserves in excess of 27 years;

(f) An erroneous, arbitrary and capricious overstatement of Canadian's annual income available for return in the amount of $114,000, which is reflected in the rate reduction order and deprives Canadian of that amount annually;

(g) A failure to grant depreciation allowances sufficient to permit Canadian to recover approximately $6,500,000 for replacements which will necessarily have to be made long prior to the 50-year service life period adopted by the Commission; and

(h) A reduction in Canadian's annual income by not less than $137,500 annually through the Commission's application of its cost of service allocation theories which, among other things, assumes jurisdiction over that portion of Canadian's gas sold by Canadian to Colorado Interstate which Colorado Interstate sells for other than resale purposes and over which the Commission has no jurisdiction.

It is submitted that a rate reduction order which is grounded upon an unwarranted assumption of prohibited jurisdiction expressly withheld from the Commission by the Congress, over production and gathering and over gas not sold for resale for ultimate public consumption cannot be in the public interest, and that a rate reduction order which must of necessity leave Canadian with an annual cash deficit of $551,000 and thus foreshadow its early financial ruin cannot be squared with the provisions of the Act, the Fifth Amendment, or the "end result" and "rate impact" principles announced by this Court in the Natural Gas Pipeline and Hope cases.

It is further submitted that the Circuit Court has misconstrued and misinterpreted the pronouncements of this Court in the Hope and Natural Gas Pipeline cases with respect to "end result" and "rate impact" principles and has adopted a view of such pronouncements which would reduce judicial review of the actions of the Commission under the Act to merely a perfunctory burial service over the grievances of the petitioner. It is further submitted that such a view is not justified by, but is in conflict with, said decisions and that this Court should exercise its supervisory power to clarify the same in the interest of the public and the natural gas industry, as well as your petitioner and the Commission.

CONCLUSION.

For the foregoing reasons it is respectfully submitted that the petition for writ of certiorari should be granted.

APPENDIX

The pertinent provisions of the Natural Gas Act of 1938 (52 Stat. 821, et seq.; Title 15, U.S.C.A., Sec. 717) are as follows:

Sec. 1 (a). "As disclosed in reports of the Federal Trade Commission made pursuant to S. Res. 83 (Seventieth Congress, first session) and other reports made pursuant to the authority of Congress, it is hereby declared that the business of transporting and selling natural gas for ultimate distribution to the public is affected with a public interest, and that Federal regulation in matters relating to the transportation of natural gas and the sale thereof in interstate and foreign commerce is necessary in the public interest."

Sec 1 (b). "The provisions of this Act shall apply to the transportation of natural gas in interstate commerce, to the sale in interstate commerce of natural gas for resale for ultimate public consumption for domestic, commercial, industrial, or any other use, and to natural-gas companies engaged in such transportation or sale, but shall not apply to any other transportation or sale of natural gas or to the local distribution of natural gas or to the facilities used for such distribution or to the production or gathering of natural gas."

Section 4 (a). "All rates and charges made, demanded, or received by any natural-gas company for or in connection with the transportation or sale of natural gas subject to the jurisdiction of the Commission, and all rules and regulations affecting or pertaining to such rates or charges, shall be just and reasonable, and any such rate or charge that is not just and reasonable is hereby declared to be unlawful.

(b). "No natural-gas company shall, with respect to any transportation or sale of natural gas subject to the jurisdiction of the Commission, (1) make or grant any undue preference or advantage to any person or subject any person to any undue prejudice or disadvantage, or (2) maintain any unreasonable difference in rates, charges, service, facilities, or in any other respect, either as between localities or as between classes of service.

(c). "Under such rules and regulations as the Commission may prescribe, every natural-gas company shall file with the Commission, within such time (not less than sixty days from the date this Act takes effect) and in such form as the Commission may designate, and shall keep open in convenient form and place for public inspection, schedules showing all rates and charges for any transportation or sale subject to the jurisdiction of the Commission, and the classifications, practices, and regulations affecting such rates and charges, together with all contracts which in any manner affect or relate to such rates, charges, classifications, and services."

Section 5 (a). "Whenever the Commission, after a hearing had upon its own motion or upon complaint of any State, municipality, State commission, or gas distributing company, shall find that any rate, charge, or classification demanded, observed, charged, or collected by any natural-gas company in connection with any transportation or sale of natural gas, subject to the jurisdiction of the Commission, or that any rule, regulation, practice, or contract affecting such rate, charge, or classification is unjust, unreasonable, unduly discriminatory, or preferential, the Commission shall determine the just and reasonable rate, charge, classification, rule, regulation, practice, or contract to be thereafter observed and in force, and shall fix the same by order: *Provided, however,* That the Commission shall have no power to order any increase in any rate contained in the currently effective schedule of such natural gas company on file with the Commission, unless such increase is in accordance with a new schedule filed by such natural gas company; but the Commission may order a decrease where existing rates are unjust, unduly discriminatory, preferential, otherwise unlawful, or are not the lowest reasonable rates."

Sec. 5 (b). "The Commission upon its own motion, or upon the request of any State commission, whenever it can do so without prejudice to the efficient and proper conduct of its affairs, may investigate and determine the cost of the production or transportation of natural gas by a natural-gas company in cases where the Commission has no authority to establish a rate governing the transportation or sale of such natural gas."

Section 6 (a). "The Commission may investigate and ascertain the actual legitimate cost of the property of every natural-gas company, the depreciation therein, and, when found necessary for rate-making purposes, other facts which bear on the determination of such cost or depreciation and the fair value of such property."

Section 19 (b). "Any party to a proceeding under this Act aggrieved by an order issued by the Commission in such proceeding may obtain a review of such order in the circuit court of appeals of the United States for any circuit wherein the natural-gas company to which the order relates is located or has its principal place of business, or in the United States Court of Appeals for the District of Columbia, by filing in such court, within sixty days after the order of the Commission upon the application for rehearing, a written petition praying that the order of the Commission be modified or set aside in whole or in part. A copy of such petition shall forthwith be served upon any member of the Commission and thereupon the Commission shall certify and file with the court a transcript of the record upon which the order complained of was entered. Upon the filing of such transcript such court shall have exclusive jurisdiction to affirm, modify, or set aside such order in whole or in part. No objection to the order of the Commission shall be considered by the court unless such objection shall have been urged before the Commission in the application for rehearing unless there is reasonable ground for failure so to do. The finding of the Commission as to the facts, if supported by substantial evidence, shall be conclusive. If any party shall apply to the court for leave to adduce additional evidence, and shall show to the satisfaction of the court that such additional evidence is material and that there were reasonable grounds for failure to adduce such evidence in the proceedings before the Commission, the court may order such additional evidence to be taken before the Commission and to be adduced upon the hearing in such manner and upon such terms and conditions as to the court may seem proper. The Commission may modify its findings as to the facts by reason of the additional evidence so taken, and it shall file with the court such modified or new findings, which if supported by substantial evidence, shall be conclu-

sive, and its recommendation, if any, for the modificati
or setting aside of the original order. The judgment a
decree of the court, affirming, modifying, or setting asi
in whole or in part, any such order of the Commissi
shall be final, subject to review by the Supreme Court
the United States upon certiorari or certification as p
vided in sections 239 and 240 of the Judicial Code,
amended (U.S.C., title 28, secs. 346 and 347)."

No. 380

CANADIAN RIVER GAS COMPANY, a Corporation,
PETITIONER,

v.

FEDERAL POWER COMMISSION, CITY AND COUNTY OF DENVER, COLORADO, PUBLIC SERVICE COMMISSION OF WYOMING, COLORADO-WYOMING GAS COMPANY, PUBLIC SERVICE COMPANY OF COLORADO, and COLORADO INTERSTATE GAS COMPANY, RESPONDENTS.

BRIEF OF PETITIONER.

OPINION BELOW.

The Opinion of the Circuit Court of Appeals, Tenth Circuit, is reported in 142 Fed. (2d) 943. (R., V. 8, 5066-5094.) The Opinion and Order of the Federal Power Commission is reported in 43 P.U.R. (N.S.) 205. (R., V. 1, 140-195.)

GROUNDS UPON WHICH JURISDICTION OF THIS COURT IS INVOKED.

The jurisdiction of this Court is invoked under Section 19(b) of the Natural Gas Act (52 Stat. 821; Title 15, USCA, Sec. 717r) and Section 240a of the Judicial Code, as amended by the Act of February 13, 1925 (Title 28, USCA, Section

347). The sections of the Natural Gas Act pertinent to this review are set forth in Appendix A hereto.

THE QUESTIONS PRESENTED.

The Court, by its Order of November 13, 1944, granted certiorari limited to Question No. 8 presented in the Petition for Certiorari filed herein by Canadian River Gas Company, and by its Order of January 2, 1945, enlarged the scope of review so as to include Questions 1, 2 and 3 stated in the Petition for Certiorari. The four questions now presented for the consideration of the Court in the numerical sequence set forth in the Petition for Certiorari are as follows:

Question 1.

"Whether the Circuit Court, after correctly holding that the Commission has no rate regulatory jurisdiction over Canadian's production and gathering properties, facilities and business, erroneously concluded and ruled that the Commission in this case did not exercise such prohibited jurisdiction."

Question 2.

"Whether, even assuming, *arguendo*, that the Commission has rate regulatory jurisdiction over Canadian's production and gathering properties, facilities and business, the Commission can, consistently with the Fifth Amendment to the Constitution of the United States, the requirements of the Act, and the decisions of this Court in the Natural Gas Pipeline, Hope and other cases, limit Canadian generally to a return only on the 'wildcat' or original cost of its gas leaseholds to predecessor companies prior to discovery and development over 20 years ago, to the exclusion of all evidence of value, market or otherwise, the result of this procedure being, among other things, the inclusion in the Commission's rate base of a substantial block of Canadian's most valuable leaseholds at zero valuation and a still larger block of valuable leaseholds at only 10¢ per acre valuation."

Question 3.

"Whether, even assuming, *arguendo,* that the Commission has rate regulatory jurisdiction over Canadian's production and gathering properties, facilities and business, and further assuming, *arguendo,* that it is proper in this case to include Canadian's leaseholds and wells in the rate base on the basis of original cost, the Commission can, consistently with the Fifth Amendment to the Constitution of the United States, the requirements of the Act, and the principles announced by this Court in the Natural Gas Pipeline, Hope and other cases, disallow and eliminate more than $3,000,000, plus interest during construction paid thereon, from the amount actually invested by Canadian in its original acquisition of production properties in about 1928 solely upon the ground that the sum so eliminated allegedly represented a profit between affiliated companies, and, therefore, formed no proper part of the cost of said properties, where the Record clearly demonstrates that the transaction resulting in the acquisition of said properties was not between affiliates and that the price paid therefor was not excessive."

Question 8.

"Whether the Commission can, consistently with the Fifth Amendment to the Constitution of the United States and the provisions of the Act, reduce the rates and charges of Canadian on that part of its natural gas sales to Colorado Interstate which is not sold by the latter for ultimate distribution to the public but is sold by it directly to its industrial customers; furthermore, independent of the above question, whether the Commission erred in making no separation or allocation as between Canadian's properties devoted to intrastate sales in Texas and its properties devoted to interstate sales, or as between the properties of Canadian and the properties of Colorado Interstate, and in using in lieu thereof a substitute method of allocation of cost of service which results in burdening non-regulable gas with costs actually chargeable against regulable gas, in violation of the Fifth Amendment to the Constitution of the United States and the Act."

ABBREVIATIONS USED.

For the sake of brevity the following abbreviations will be used herein:

"R." for the printed Record filed herein, and "V" for the "Volume" of the Record, followed by the page number in the Record to which reference is made.

"Circuit Court" for "United States Circuit Court of Appeals for the Tenth Circuit."

"Commission" for "Federal Power Commission."

"Act" for "Natural Gas Act of 1938."

"Amarillo" for "Amarillo Oil Company."

"Canadian" for the petitioner, "Canadian River Gas Company."

"Colorado Interstate" for "Colorado Interstate Gas Company."

"Southwestern" for "Southwestern Development Company."

"Standard" for "Standard Oil Company (New Jersey)."

"Cities Service" for "Cities Service Company."

"Cost Contract" for the Agreement dated as of January 3, 1928, between Canadian and Colorado Interstate covering the purchase and sale of gas at cost under the terms of which petitioner has been ordered by the Commission to reduce its rates or charges in the amount of $551,000 annually.

"Natural Gas Pipeline case" for "*Federal Power Commission v. Natural Gas Pipeline Company,*" 315 U. S. 575.

"Hope case" for "*Federal Power Commission v. Hope Natural Gas Company,*" 320 U. S. 591.

STATEMENT OF THE CASE.

The Commission entered an order following a hearing, affirmed by the Circuit Court, reducing the purchase price for natural gas and compensation for the performance of other contract obligations, which Canadian is entitled to

receive, in the aggregate sum of $561,000 annually. Such total reduction is in the amount of $10,000 annually for natural gas sold by Canadian to Clayton Gas Company for resale in the Town of Clayton, New Mexico, and in the amount of $551,000 annually for the compensation (including the sale price of gas) which Canadian is entitled to receive under the Cost Contract between Canadian and Colorado Interstate. An investigation of the rates charged by Colorado Interstate for the sale of its gas was also had by the Commission, and the Canadian and Colorado Interstate cases were consolidated for the purpose of the hearing, and the Commission likewise entered its separate order requiring a reduction in the rates charged by Colorado Interstate. Limited review has been granted by this Court to Colorado Interstate in Case No. 379 to the action of the Circuit Court in affirming the Commission's rate reduction order as against Colorado Interstate.

As Canadian's case and Colorado Interstate's case were consolidated for the hearing before the Commission, a joint printed Record in their respective cases was filed in the Circuit Court and a joint printed Record has been filed here, although the two cases are entirely separate and independent cases.

The printed Record is approximately 5100 pages in length, but we shall do our best to summarize in as brief a space as possible the portions of this lengthy Record deemed pertinent to a consideration of the four questions presented herein.

While almost all of the record facts hereinafter set forth or summarized are pertinent to all four questions presented, some have particular pertinency to specific points. For the convenience of the Court, therefore, we shall first submit a brief statement of general historical facts pertinent to all questions presented, and then summarize under separate headings additional facts which are particularly pertinent to the separate questions indicated, with the understanding that such facts may likewise be pertinent to one or more of the other questions.

The Petitioner.

As stated by the Commission in its Opinion (R., V. 1, 143), Canadian is engaged in several different and distinct business operations or functions; viz., (a) production; (b) gathering; (c) transportation, and (d) sales of natural gas. Its producing and gathering operations are conducted wholly within the Texas Panhandle Field in the State of Texas. It owns and operates in that field approximately 300,000 acres of natural gas leaseholds, and, as of December 31, 1939, was operating 94 gas wells thereon, and its gathering system consisted of approximately 144 miles of various sizes of pipe. Canadian produces from its own properties *all* gas which it sells.

Canadian owns and operates one transmission line commencing at Bivins Station, being one terminus of its gathering system in the Texas Panhandle Field, Texas, and ending at a point near the Town of Clayton, New Mexico. It leases other transmission facilities commencing at another terminus of its gathering system in the Texas Panhandle Field known as Fritch Station and ending at a point near Gray, Oklahoma.

Canadian sells substantial quantities of gas *at the well head* in the Texas Panhandle Field to Amarillo Oil Company for the City of Amarillo and the Town of Channing, Texas, and along its transmission line for the Dalhart, Hartley and Texline, Texas, markets, all of which are purchased and consumed wholly within the State of Texas. It transports gas through its transmission line to a point near Clayton, New Mexico, which is about 85 miles from the field. Some of the gas so transported by Canadian is there sold and delivered to the Clayton Gas Company for distribution in the Town of Clayton, New Mexico. The greater portion of the gas so transported by Canadian is there sold and delivered to Colorado Interstate, and then transported, sold and delivered by Colorado Interstate through its own transmission facilities which start at Clayton Junction, New Mexico, and continue northward about 300 miles to the Denver, Colorado, city limits. Part of the gas so purchased and transported by Colorado Interstate is sold by it for resale for ultimate public consumption, and

part is sold by it directly to its own industrial consumers. Canadian also sells a quantity of gas to Colorado Interstate for resale to Natural Gas Pipeline Company of America, which is delivered through the leased facilities mentioned above to Colorado Interstate at Gray Junction, Oklahoma (R., V. 2, 708).

The gas sold by Canadian to Colorado Interstate at Clayton Junction, New Mexico, is sold and delivered pursuant to a contract between Canadian and Colorado Interstate, dated as of January 3, 1928, (Ex. 16, R., V. 2, 711-780), known as the "Cost Contract" under which Canadian is required to perform numerous obligations, such as maintaining and renewing its gas leasehold interests, drilling wells, constructing and maintaining necessary pipe line and other facilities in order to supply Colorado Interstate's markets and to produce, gather, transport and sell its gas to Colorado Interstate at Canadian's cost for a fixed period of 20 years and so long thereafter as Colorado Interstate elects to buy. It is the over-all compensation which Canadian is entitled to receive under this Cost Contract which the Commission's rate reduction order requires to be reduced to the extent of $551,000 annually.

The location of Canadian's production and gathering properties in the Texas Panhandle Field, Texas, its transmission system, and the connecting transmission system of Colorado Interstate and other related matters are shown on a Flow Map, Commission's Exhibit 138, reproduced copy of which is attached hereto as Appendix B. (R., V. 2, 1079.)

General History of Canadian's Gas Leasehold Properties.

Over 27 years ago (1917), a few ranchers and small businessmen residing in and about Amarillo, Texas, incorporated and organized a small corporation called "Amarillo Oil Company," for the purpose of drilling a "wildcat" well for oil in what has now become the great Texas Panhandle Field in the State of Texas. (R., V. 5, 2837, 3040.) At that time there had been no discovery of oil or gas within 200 miles of the proposed well location. (R., V. 7, 3673.) Consequently, the cost to Amarillo of assembling the block of leases to be tested was purely nominal, except for drilling obligations.

After many unfortunate experiences, financial and otherwise, the "wildcat" test well was finally completed in the fall of 1918 as a gas well—the first commercial producer of either oil or gas in the Texas Panhandle Field. From that successful "wildcat" beginning, the field has been subsequently developed by the drilling of successive test wells until it now contains 1,500,000 proven acres on which there are located approximately 1,650 wells producing gas only, and approximately 4,200 wells producing both oil and gas. (R., V. 1, 469.) Canadian's acreage produces no oil.

In 1924 Southwestern became the owner of all the capital stock of Amarillo. In the meantime, Amarillo had acquired additional blocks of leaseholds in the field, and its total holdings were then approximately 300,000 acres. Substantially all of such leaseholds were likewise granted for oil exploration at a time when the acreage embraced therein was classified as "unproven" and valued accordingly. Additional test wells were drilled on this acreage, most of which proved to be substantial gas producers, although some resulted in dry holes.

Amarillo Oil Company had no market at that time for its gas production, except for relatively small sales *at the well head* for the City of Amarillo, Texas, and vicinity, and one industrial sale at a plant near Amarillo. It had one well with a capacity substantially in excess of the quantity required to supply its entire available market. (R., V. 1, 459.)

Added to the lack of adequate markets, the gas properties and investments of Amarillo were threatened at that time with still another menace. Tremendous volumes of gas in the field were being blown and wasted in the air, to the extent that it became a national scandal.[1] (R., V. 7, 3673-3675.) Enormous quantities of gas were being consumed by carbon black plants and natural gasoline plants. The seriousness of the situation was ultimately recognized by the Texas Legislature, which enacted new legislation to control the wastage of gas, as well as its use for carbon black purposes. (R., V. 7, 3675-3676.)

It became obvious that the Company could not realize upon

[1] Thompson v. Consolidated Gas Utilities Corp., 300 U. S. 55.

its extensive gas properties unless new markets of a substantial character were developed promptly. There were then no long-distance pipe lines connected to the field. Pipe line markets in the immediate vicinity of the field were either occupied or too small to be attractive, and it seemed advisable to look for markets at greater distances. (R., V. 1, 402.)

Origin of Denver Project.

The transportation of gas by pipe line over long distances was in its infancy. Neither Southwestern nor any of its affiliated companies had had any previous experience in transporting gas over long distances; moreover, Southwestern and its subsidiaries lacked the necessary capital with which to construct such a pipe line. (R., V. 1, 402, 403.) The City of Denver, located a distance of approximately 350 miles from the Texas Panhandle Field, and intervening territory, seemed to be the closest available market for natural gas in substantial quantities. (R., V. 1, 402.) In 1926 Southwestern approached Standard Oil Company (New Jersey) regarding the construction of a pipe line project to Denver and intervening territory, because the latter had had a long and successful experience in operating natural gas projects in other areas, and was fully able to finance such a project. (R., V. 1, 403.) Standard investigated the feasibility of the project with favorable results. Cities Service Company was then brought into the negotiations because its subsidiary, Public Service Company of Colorado, held a manufactured gas franchise in Denver, and another subsidiary company held a similar gas franchise in Pueblo, Colorado. (R., V. 1, 403.)

The three parties, to wit: Standard, which was experienced in operating long-distance pipe lines and had the ability to finance the same; Cities Service, which controlled important market outlets in Colorado through its subsidiaries; and Southwestern, which controlled substantial gas reserves in the Texas Panhandle Field through its subsidiary, Amarillo, began negotiations which continued for almost a year and finally culminated in an agreement between the parties on April 5, 1927, for the construction of a pipe line to Denver and intervening points and the acquisition

of gas leaseholds and wells owned by Amarillo for the project. (R., V. 1, 403-411.)

Neither Standard nor Cities' Service had any interest whatsoever in either Amarillo or Southwestern on that date (April 5, 1927), prior thereto, or subsequent thereto. There was no corporate affiliation between any of the three participating companies which executed the contract of April 5, 1927. (R., V. 1, 460, 613-622.) *As stated above, the contract was entered into only after long and continued arm's-length negotiations between the parties.* (R., V. 1, 493-495; 518-526.)

The Denver Project agreement of April 5, 1927, between Standard, Cities Service and Southwestern (Ex. 1; R., V. 1, 381-400), known as the "Memorandum of Stipulations," sets out in considerable detail the terms and conditions under which the parties agreed to develop and participate in the project, but it is important here to point out briefly two of the principal obligations assumed thereunder by Southwestern.

Under this three-party agreement Southwestern obligated itself (1) to organize and incorporate a company (now Canadian), *separate and apart from its other companies and projects*, to which it would cause Amarillo to convey, free of all debts, liens and encumbrances, all of Amarillo's gas leaseholds, rights and wells in the Texas Panhandle Field at an agreed price of $5,000,000; and (2) to cause the company (Canadian) receiving such gas leaseholds, rights and wells to enter into a long-term contract to dedicate its gas reserves to the project and to sell gas to the principal project company (now Colorado Interstate) on a cost basis in consideration of the issuance by Colorado Interstate to Southwestern, as the nominee of Canadian, of 42½% of its authorized common stock with no par value and $1,000,000 par value of its authorized 6% preferred stock. (R., V. 1, 381-400.)

Canadian's Purchase of Gas Leaseholds, Rights and Wells for $5,000,000.

The purchase price of $5,000,000, as negotiated and agreed to by Standard, Cities Service and Southwestern, for the gas

leaseholds, rights and wells of Amarillo, which was to form the foundation for the project, was advanced and paid to Amarillo by Standard in two equal payments made in December, 1927, and January, 1928, which was prior to the incorporation of Canadian (R., V. 5, 2936). Pursuant to its obligation under the original three-party project agreement, Southwestern organized Canadian in February, 1928, *separate and apart from its other companies and projects*, and subsequently caused Amarillo to formally transfer and convey its gas leaseholds, rights and wells to Canadian. There were no negotiations whatsoever between Canadian and Amarillo (R., V. 1, 455-456).

To finance the several obligations imposed upon Canadian under the three-party agreement of April 5, 1927, i. e., to acquire gas-producing properties, to drill wells, to construct gathering facilities and transmission facilities, and to pay the agreed purchase price of $5,000,000 for the gas leaseholds, rights and wells of Amarillo, Canadian issued and sold to Colorado Interstate $11,000,000 principal amount of its 6% First Mortgage Bonds maturing in annual installments of approximately $600,000 through 1947. Out of the proceeds derived from the sale of its bonds to Colorado Interstate, Canadian repaid the $5,000,000 advance made by Standard to finance Canadian's purchase of gas leaseholds, rights and wells from Amarillo (R., V. 1, 406, 462; R., V. 2, 656-685).

Canadian's Cost Contract With Colorado Interstate.

Acting again in pursuance of the obligations imposed upon it under the terms of the three-party project agreement of April 5, 1927, Canadian, for the consideration hereinabove described, entered into a contract with Colorado Interstate as of January 3, 1928, to furnish Colorado Interstate with its natural gas requirements at cost over a period of years (Ex. 16; R., V. 2, 744-780).

This particular contract is unusual and unique in many respects. It is not the ordinary contract for the current purchase and sale of natural gas as a commodity, and it is not the ordinary contract that courts or regulatory bodies are called upon to consider when confronted with a challenge

to the right of abrogation. Briefly, the Cost Contract, and Canadian's related Trust Indenture (R., V. 2, 656-685) securing its bonds held by Colorado Interstate, require Canadian:

(a) to maintain and renew all its gas leasehold interests, to drill necessary wells, and to construct and maintain necessary pipe line and other facilities in order to supply Colorado Interstate's market at all times with its gas requirements;

(b) to produce, gather, transport and *sell* its gas to Colorado Interstate *at absolute cost* for a fixed period of 20 years, and so long thereafter as Colorado Interstate elects to buy;

(c) to dedicate its gas reserves and facilities to the service of Colorado Interstate's market, with no right to sell or otherwise dispose of its gas or gas properties to others for carbon black, industrial or any other purpose without the consent of Colorado Interstate (except for outstanding commitments to sell gas to Amarillo Oil Company to supply the Amarillo market)[2]; and

(d) to credit Colorado Interstate's cost of gas with any and all revenue, income or profits which it may receive from *any* source, and to continue to operate strictly as a non-profit company for the full term of the Cost Contract.

[2]The cost of gas delivered by Canadian to Colorado Interstate under the Cost Contract is computed by deducting all outside revenues[3] received by Canadian (including sales of gas to others) from the aggregate cost of producing and delivering all gas sold to all purchasers. Such cost includes interest on and amortization of Canadian's funded and other

[2]Canadian has two outstanding contract obligations to sell gas *at cost* i.e.: (1) to supply all markets of Colorado Interstate, as above described and (2) to supply the Amarillo market of Amarillo Oil Company, which commitment was in existence long prior to the organization of Canadian and has certain preferential rights over all other markets of Canadian. (R., V. 1, 402; V. 2, 714, 715, 748)

[3]For example, in 1929 Canadian received in excess of $500,000 from the United States Government in final payment of the purchase price for certain helium-bearing leaseholds and wells of Canadian. Since the sum so paid represented revenues received by Canadian, it was likewise credited as a deduction against Colorado Interstate's current cost of gas under the Cost Contract. (R., V. 5, 2723; R., V. 1, 381-401)

indebtedness, but does not include depreciation and depletion, or retirements.

Thus, it will be seen that for the services to be rendered to it by Canadian under the Cost Contract, Colorado Interstate agreed to underwrite and guarantee Canadian's net cost of operations after crediting profits or income from all other sources, but no more. Moreover, Colorado Interstate was granted direct and complete control over Canadian's costs which it is obligated to reimburse. Obviously, Canadian has not paid, and cannot pay so long as the Cost Contract is in effect, any dividends, earnings or profits in any manner to the owners and holders of its capital stock. This Contract, as above indicated, covers not only Canadian's transmission system, but also its production and gathering properties, facilities and business. Under the Cost Contract Canadian's receipts in any given year can never exceed its actual costs.

Canadian's Trust Indenture provides that in case of default thereunder, in addition to the usual remedies of foreclosure, etc., the Trustee may forthwith take possession of, operate, manage and control the trust estate and, at its discretion, may sell the trust estate to the highest and best bidder "who will assume and perform the obligations of the company" under its Cost Contract with Colorado Interstate. The trust estate *must* be sold in one parcel and as an entity, and the purchaser or purchasers at any sale *must* be required to assume the performance of Canadian's obligations under its Cost Contract with Colorado Interstate.

The Commission's Findings and Order and the Circuit Court's Affirmance Thereof.

The Commission's "Order Reducing Rates," its Opinion supporting such order, and the Opinion of the Circuit Court affirming such order, raise several important questions which form the basis of the petition in this case. Canadian contends that on a rate regulatory theory or any other theory the Commission in its various findings and ultimately in its rate reduction order, committed numerous errors of law, constituting violations of the Act itself and which necessarily deprive Canadian of its property without due process

in violation of the Fifth Amendment, and that viewed as a whole, the rate reduction order cannot be sustained under the "end result" or "rate impact" principles announced by this Court in the Natural Gas Pipeline and Hope cases. In so far as deemed pertinent at this time, the following additional statements are submitted with respect to the questions involved:

1. *Jurisdiction Over Production and Gathering (Question 1).*

In its Opinion (R., V. 1, 147), the Commission has sought to justify its exercise of rate regulatory jurisdiction over Canadian's producing and gathering properties by stating that "Canadian's production and gathering operations are an integral part of its total operations, including transportation in interstate commerce and the sale of natural gas for resale in interstate commerce" and that "Canadian's operations are an integral part of Colorado's operations and the two comprise a single operating system."

In their Answer Brief (pp. 19-25) before the Circuit Court, counsel for the Commission were even more positive and expansive with respect to the alleged rate regulatory powers of the Commission over Canadian's producing and gathering properties and operations. After stating that Canadian's claims of the lack of such jurisdiction were without merit even though "the determination of the rates, through rate base, etc., touches incidentally on production and gathering", because "such a construction would frustrate and nullify the very purpose of Congress", they conclude that "the Commission has jurisdiction of production and gathering so far as production and gathering is in aid of sales of natural gas in interstate commerce for resale subject to the rate jurisdiction of the Commission".

During the course of the hearing, the Commission overruled Canadian's objections to the introduction of *rate regulatory* evidence relating to production and gathering, notwithstanding that Section 1(a) of the Act declares only that the business of transporting and selling natural gas for ultimate distribution to the public is affected with a public in-

terest and that the regulation of such business is necessary in the public interest, and notwithstanding that Section 1 (b) of the Act delegates only to the Commission rate regulatory jurisdiction over the interstate transportation and sale of natural gas for resale for ultimate public consumption and expressly provides that the Act "shall not apply * * * to the production or gathering of natural gas" (R., V. 5, 2639, 2640).

The Circuit Court did not agree with the Commission's contentions in this respect. It ruled as a matter of law that the Commission does not have rate regulatory jurisdiction over production and gathering, but then farther ruled and held that what the Commission did in this case does not constitute the exercise of rate regulatory jurisdiction over production and gathering (R., V. 8, 5073-5075). There has been no appeal by the Respondents from such rulings or any part thereof. Thus, there is presented here for consideration the specific question as to whether the Commission has, in this case, as a matter of fact or in legal effect, exercised rate regulatory jurisdiction over Canadian's producing and gathering properties and operations, which is expressly prohibited by the Act.

In support of its contention that the Commission, with the Circuit Court's affirmance, has in fact and legal effect exercised prohibited rate regulatory jurisdiction over Canadian's producing and gathering properties and operations, Canadian maintains that the Commission has treated every element of Canadian's production and gathering properties, facilities and business in precisely the same manner as its interstate transmission properties, facilities and business and has subjected every element of Canadian's production and gathering facilities to the same rate regulatory measures and procedures as Canadian's Interstate transmission properties, facilities and business for the purpose of arriving at its ultimate conclusions with respect to rates and charges, and that if the Act had expressly delegated full and complete rate regulatory jurisdiction over Canadian's production and gathering properties, facilities and business, the Commission could have done no more than it has done in this case.

In this connection, the following facts from the Record are now summarized:

(a) The Record contains uncontradicted evidence as to the fair market value of Canadian's gas as a commodity at the wellhead in the field and at the end of Canadian's gathering system, which is the beginning point of interstate transportation (R., V. 6, 3256, 3280; Exhibit 168, Sheets Nos. 113, 114 and 127; R., V. 6, 3281). This evidence consisted of the testimony of Canadian's witnesses, R. A. Ford and R. J. Wallace, corroborated by the testimony of Commission witness, Lester B. McKinstry. It was not contradicted and established a 4¢ per Mcf commodity market value for Canadian's gas at the wellhead in the field (16.4# pressure base) and at least a 7¢ per Mcf commodity market value for the gas at Bivins Station, Texas, which is one terminus of the gathering system and the beginning of the interstate transportation. Canadian contends that this commodity value of Canadian's gas should be used as the Commission's jurisdictional starting point, but the Commission in its Opinion completely ignored such commodity value (R., V. 1, 140-195).

(b) In assuming and exercising full rate regulatory jurisdiction over Canadian's production and gathering properties and operations, the Commission included in its rate base for Canadian not only Canadian's interstate transmission properties, but also its production and gathering properties (R., V. 1, 144-195; V. 5, 2717-2721). Approximately two-thirds of Canadian's total rate base as found by the Commission in the amount of $9,375,000 (R., V. 1, 187) represents production and gathering properties of Canadian (R., V. 5, 2717-2721). The Commission expressly found (R., V. 1, 187) that it is such a rate base, including production and gathering properties, upon which Canadian is entitled to earn a fair rate of return as fixed by the Commission.

(c) In its rate base for production and gathering properties, the Commission determined and included an allowance for working capital which it deemed sufficient to enable Canadian to carry on its production and gathering operations and, likewise, the Commission has purported to determine in its rate base for production and gathering properties

what additional wells should be drilled and what additional gathering facilities should be installed in the future (R., V. 5, 2530-2556).

(d) After finding Canadian's total rate base to be $9,375,000 (R., V. 1, 187), of which approximately two-thirds represents production and gathering properties (R., V. 5, 2717-2721) (even on the Commission's basis of determining a rate base), the Commission then found that Canadian was entitled to a return of 6½% per annum upon its total rate base (R., V. 1, 187), more than two-thirds of which, as above stated, is attributable to the hazardous business of discovering, exploring, developing and operating natural gas production properties.

(e) The Commission has determined and made an allowance for Canadian's total annual operating expenses (including depreciation and depletion), the greater portion of which represents the cost of producing and gathering natural gas (R., V. 1, 171; V. 4, 2341-2345).

(f) After determining the total annual income of Canadian from all sources, the greater portion of which represents the cost of producing and gathering natural gas under its Cost Contract with Colorado Interstate, the Commission has deducted its determined annual operating expenses (mostly production and gathering) from such total income, and then, after making a return allowance of 6½% upon its determined rate base (mostly production and gathering), it has found an alleged excess income being received by Canadian, which forms the basis for its rate reduction order (R., V. 1, 187).

(g) As appears from the Commission's Opinion (R., V. 1, 173-176), the Commission, following its application of its cost allocation formula, hereinafter under Question 8 more fully detailed, has found that Canadian has an excess revenue over costs in the total amount of $615,000. This finding is based upon its conclusions from the Record as above outlined and as above shown includes its various and sundry determinations with respect to all of Canadian's business and properties, including production and gathering, intrastate sales in Texas and interstate direct gas sales, as well as interstate resale gas sales. Through the application of such

allocation formula hereinafter detailed, the Commission's rate reduction order requires Canadian to reduce the compensation which it is entitled to receive from Colorado Interstate by the sum of $551,000 annually (R., V. 1, 176, 187, 188).

(h) As hereinbefore explained, Canadian sells gas to Colorado Interstate under a Cost Contract (R., V. 2, 711-780). The Commission has designated this contract as "FPC Rate Schedule No. 1." Under this Cost Contract, Canadian is obligated to perform various obligations and services, in addition to selling and delivering gas to Colorado Interstate as a commodity, some of which are clearly beyond the jurisdiction of the Commission, namely, to acquire, maintain and develop a substantial block of gas leaseholds, to drill and operate wells, to construct and operate gathering facilities, to pay off Canadain's funded debt in fixed amounts at fixed times, to sell gas to others only as permitted by Colorado Interstate, and finally to receive from Colorado Interstate as compensation for the rendering of all of these services (and including the purchase price of the gas actually purchased) only Canadian's actual net cost[1] incurred in connection therewith. Since Canadian sells its gas to Colorado Interstate at its actual net cost, Canadian's annual revenue must always be in exact balance with its annual expenses, and it can never make a profit. The Commission's rate reduction order, following the application of its cost allocation formula, abrogates the compensation provision of this Cost Contract by reducing the cost reimbursement Canadian is entitled to receive thereunder by $551,000 annually which means $551,000 below Canadian's actual expense. The Commission's order, however, does not purport to relieve Canadian from the obligation to perform all obligations and render all the services required of it under the Cost Contract, all of which means that Canadian will have an expense of $551,000 annually more than it will be entitled to receive under the Commission's rate reduction order. This is done notwithstanding the fact that the Cost Contract, in addition to covering the sale of resale gas subject to the Commission's jurisdiction, also covers direct sale gas not subject to its

[1] The cost paid by Colorado Interstate is Canadian's total cost less all revenues received by Canadian from all other sources.

jurisdiction and gas sold intrastate in the State of Texas over which the Commission has no jurisdiction, and likewise covers production and gathering operations and expenses over which the Commission has no jurisdiction.

2. *Valuation of Canadian's Leasehold Properties (Question 2):*

It is further Canadian's contention that, even assuming, *arguendo*, that the Commission does have rate regulatory jurisdiction over its production and gathering properties, facilities and business, it is entirely improper to include Canadian's leaseholds in a rate regulatory rate base on the Commission's original cost or prudent investment theory, ignoring all evidence of value which appears from the uncontradicted evidence in the case, and that original cost or prudent investment is entirely inappropriate for determining the basis of inclusion of gas leaseholds in a rate base, and the use of such an exclusive test or basis cannot result in just and reasonable rates either to Canadian or the public and must necessarily deprive Canadian of its property without due process in violation of the Fifth Amendment.

In considering Canadian's gas leasehold properties for rate base purposes, the Commission has limited its consideration to the original cost of acquisition, commencing with the leases upon which the first discovery well of Amarillo Oil Company was drilled in 1918. This practice of the Commission purports to limit Canadian generally to a return of 6½% per annum on only the "wildcat" value of its leaseholds while in the hands of predecessor companies, to the exclusion of all discovery, market or other values, notwithstanding the fact that prior to the acquisition by Canadian none of such gas leaseholds had produced gas for interstate transportation, and none of such gas leaseholds had been devoted to a public use (R., V. 1, 459; V. 5, 2861-2927-2929). Canadian contends (even assuming rate regulatory jurisdiction) that original cost is not the proper basis for the inclusion of gas-producing leaseholds in a rate base, and that the Commission has erred in blindly following its original cost and prudent investment theories with respect to Canadian's

gas leaseholds and in wholly disregarding uncontroverted evidence of value.

An analysis of the testimony of Commission witnesses, which the Commission adopted substantially (Ex. 146, Sheets 62-64; R., V. 5, 2717, 2721), shows that the Commission used the sum of $1,604,020.61 as the starting point for its findings as to original cost of or investment in Canadian's leaseholds as of December 31, 1939. Then, as appears from Paragraph 8 of the Commission's formal findings (R., V. 1, 186), a deduction of $653,681 was made for depletion. This means that Canadian's bare leaseholds have been included in the Commission's original cost rate base at a value of something less than $1,000,000.

In adopting this valuation for rate base purposes, the Commission has wholly ignored substantial and uncontradicted evidence that "the present market value of Canadian's leaseholds" (excluding wells) is the sum of $15,646,787.64. This evidence is the testimony of Canadian's witness Wallace (Ex. 181; R., V. 6, 3181-3254). This Exhibit 181 was introduced through Canadian's witness R. J. Wallace, supported by lengthy and detailed testimony. His knowledge of the subject and qualifications are unchallenged. The Exhibit covers in detail each particular lease of Canadian, data concerning the wells drilled thereon, the initial open flow and rock pressure, present open flow and rock pressure, the production to date, etc., and the present market value aggregating over $15,000,000 for Canadian's leaseholds themselves, exclusive of oil rights, and without giving any consideration to sales contracts, or producing wells, or equipment, and as if the wells were not connected to pipe lines. In other words, Wallace's valuation is for the bare gas leaseholds themselves.

The Commission has found that Canadian's recoverable gas reserves are 2,800,000,000 Mcf (R., V. 1, 159). Reducing these figures so found by the Commission to its *value of the gas in place*, it appears that the Commission, in effect, has found the present value of the gas in place to be only 34/1000ths of one cent per Mcf. On a comparative basis, and using Wallace's $15,646,787.64 valuation, as applied to the Commission's finding of 2,800,000,000 Mcf recoverable re-

serve, the value of the gas in place is approximately ½¢ per Mcf.

The original "wildcat" cost to Canadian's predecessors in interest of five important leaseholds, containing approximately 47,000 acres, allowed by the Commission is $4,244.24, which is less than 10¢ per acre (R., V. 5, 3051). Three of these leases are included *at zero valuation*. The present fair value of these same five leaseholds (exclusive of wells), as testified to by Wallace with supporting evidence as to such value, was $3,345,923 (R., V. 6, 3235, 3237, 3238, 3242, 3243). A similar situation exists in respect to the Commission's valuation of the remainder of Canadian's leaseholds (R., V. 5, 3051).

The Commission has wholly ignored all evidence of the market value of gas at the wellhead in the Texas Panhandle Field as a measure of the value of said leaseholds. Canadian's General Superintendent Ford testified that the market value of gas at the wellhead in the Texas Panhandle Field is not less than 4¢ per Mcf on a 16.4-pound pressure base, or not less than 3.8¢ per Mcf on a 14.65-pound pressure base (R., V. 6, 3255-3281). This testimony was corroborated by Wallace, and by Commission's Exhibit 168, Sheets 13 and 127 (R., V. 6, 3281).

In arriving at its rate base for Canadian, the Commission used its original cost or prudent investment theory not only for Canadian's interstate transportation properties, but also for its production and gathering properties, and completely ignored the fact that the latter properties are used for wellhead and intrastate sales in Texas and for direct interstate sales, over which the Commission has no jurisdiction. Moreover, as will hereinafter be more fully detailed, the Commission, in arriving at its original cost of prudent investment rate base actually deducted over $3,000,000 from Canadian's actual original cost of leaseholds and wells.

3. *Canadian's Actual Cost of Leasehold Properties (Question 3).*

Much of the evidence relating to the acquisition and actual cost of Canadian's leasehold properties is summarized at

pages 7-11, supra. In order to avoid repetition, reference is here made thereto.

The Commission did not question the fact that Canadian had actually invested in its gas properties the sum of $14,648,821 in cash as of December 31, 1939. It deducted from such actual cash investment for its rate base purposes, however, the sum of $3,370,817 on the ground that it represented "affiliated company profits," and in addition thereto the sum of approximately $245,000 representing interest during construction on such alleged profits (R., V. 1, 149-151). Virtually the full amount of such deduction arises out of the transaction heretofore related, in which Canadian acquired from Amarillo Oil Company all of the latter's gas leaseholds, rights and wells for the sum of $5,000,00 for the purpose of inaugurating the Denver Project in 1928.

In making this deduction from Canadian's actual investment in gas leaseholds, the Commission, for rate base purposes, relegated Canadian to the bare provable costs of such leaseholds incurred by Amarillo and its predecessors in title, which was the cost of such leaseholds prior to the time that any wells had been drilled thereon and prior to the time that it was definitely known whether any gas would ever be produced therefrom. At the time that many of said leaseholds were acquired the nearest oil and gas production was 200 miles distant. The Commission gave no consideration whatsoever to the fact that such leaseholds when acquired were unproven and had little or no value and that, therefore, only a nominal sum was paid for the same and it wholly ignored the fact that said leaseholds possessed great value after the discovery of gas thereon and that such discovery and the increase in value necessarily preceded any use of the same for any character of public service. The Commission further ignored the fact that said leaseholds were acquired by Canadian approximately 10 years after the original discovery of gas under such leaseholds and at a time when such leaseholds had a value far in excess of the original acquistion cost in their then "wildcat" and undeveloped state. The Commission also ignored the fact that the purchase of said leaseholds by Canadian resulted from an arm's length transaction as heretofore explained, and that there

was not even an intimation in the Record that Canadian paid an excessive or imprudent price for such leaseholds. The actions and theories of the Commission in this case, if carried to a logical conclusion, would deny the prospector, or "wildcat" oil and gas operator, all the fruits of his discovery, and would necessarily limit him to the actual outlay of cash, *without profit*, in an extremely hazardous and speculative enterprise.

As of August 1, 1924, Amarillo owned approximately 46,803 acres of developed leaseholds in which it had a total provable cost for the leaseholds as such, exclusive of the wells that had been drilled thereon, of approximately $4,244, or less than 10c per acre (R., V. 5, 3038, 3051, 3040). As of that date it acquired 244,114 acres of leaseholds from Mountain States Gas Company, upon which wells had been drilled or were then drilling, and from that date to May 1, 1927, it acquired 3,998 acres from various other persons (R., V. 5, 3051). It also acquired 30,235 acres from Mountain States which were classed as unoperated leaseholds, being leaseholds upon which no wells had then been drilled (R., V. 5, 3063).

The leaseholds acquired from Mountain States Gas Company were paid for by Amarillo through the issuance of its common stock. Such leaseholds had been acquired by Mountain States in an undeveloped "wildcat" state. No gas had been sold from said leaseholds prior to that date. The total cost to Mountain States and its predecessors in title for the acreage acquired by Amarillo in exchange for its capital stock was $273,095.88 for the 244,114 acres of operated gas leaseholds, which included, however, approximately $76,318, being the drilling cost of two wells (R., V. 5, 3041, 3042). When this latter sum is eliminated, the original acquisition cost of said Mountain States leaseholds approximated $200,000, or less than $1.00 per acre. In fact, on this basis, the largest leasehold involved, being the Bivins A 30, comprising 200,000 acres, had a provable cost to Mountain States of only $105,000 for the leasehold as such. This provable cost of approximately 50c per acre was the entire amount included in the rate base by the Commission for this very valuable leasehold, exclusive of development costs.

The leaseholds above referred to that were included in the rate base for only a very nominal sum, and on the basis of their original "wildcat" provable costs, plus a very small amount of additional acreage, had an actual value of approximately $15,646,787.64 for the leaseholds as such, exclusive of all well costs, according to the uncontradicted testimony of Wallace (R., V. 6, 3181-3254). Excluding the additional acreage, such leaseholds had a minimum value of approximately $15,000,000 and were included in the rate base at a figure but little, if any, in excess of $300,000.

It is frankly admitted by the Commission and Commission witnesses that Canadian actually paid Amarillo $5,000,000 in cash for the latter's gas leaseholds, rights and wells. (R., V. 1, 150). The Commission, however, ignored the entire transaction and found, for Canadian's rate base purposes, that Amarillo, commencing at a date prior to the drilling of its "wildcat" discovery well in 1918, had invested in the properties sold only the sum of $1,879,504, and that this sum should be further reduced by $128,534 by reason of an alleged profit of another predecessor company in a sale of property by it to Amarillo (R., V. 1, 150), all of which resulted in a so-called original cost to Amarillo of approximately $1,750,000, or $3,250,000 less than the sum actually paid by Canadian in cash for such properties. Most of such provable costs, however, resulted from the drilling of gas wells and other costs incidental to the development of such leases. The provable cost of leases as such was very nominal as hereinabove pointed out.

In arriving at such provable costs, the Commission ignored, among other things, the following:

1. A sum in excess of $50,000 expended in drilling a dry hole which was one of the early exploratory wells (R., V. 5, 2870; V. 6, 3111, 3112). This well was as much a part of the development cost as the producing wells, but its cost was eliminated apparently because no one should be so foolish or imprudent as to drill non-producing wells.

2. $35,000 for interest on idle investment prior to October, 1920, when the first small volume of gas was sold (R., V. 6, 3110-3111).

3. General overhead and administrative costs estimated at $68,000 (R., V. 6, 3108-3110).

4. Delay rentals paid on undeveloped leaseholds in a sum in excess of $488,000 (R., V. 6, 3106-3108).

The Commission, in refusing to recognize the actual cash consideration which Canadian paid for its leaseholds and in applying its "prudent investment" theory to a mining enterprise such as the acquisition of "wildcat" oil and gas leases in an area more than 200 miles from known oil or gas production, denied *in toto* the value created by the "wildcatter" or prospector as the result of his discovery. It eliminated many costs actually incurred, and which costs, such as delay rentals, must be recognized, in any event, if the "wildcatter" is to be reimbursed for his actual expenditures in cash. In this case the Commission adopts and applies a theory which, if followed consistently, would prevent the "wildcatter" not only from realizing any profit upon his extremely hazardous venture, but would actually deny him the right to recover his entire out-of-pocket expense.

In addition to the original purchase from Amarillo, Canadian from time to time made other smaller purchases of gas leaseholds, one of these being the purchase of the properties of Master Oil and Gas Company consisting of 5404.2 acres of leaseholds and two gas wells for the sum of $235,054.20 (R., V. 5, 2659-2661, 2815-2816). The Commission deducted from this purchase price the sum of $12,787 (R., V. 1, 150). This deduction was made on the ground that Prairie Oil and Gas Company owned 51% of the common stock of Master Oil and Gas Company and that N. K. Moody was a Director of both the purchaser and the seller (R., V. 5, 2659-2661). No contention was made that the price was excessive. The Record is clear that in determining this so-called provable original cost of Master that Luttring, Commission witness, only went back to June 1, 1926, although the leaseholds were first acquired prior to 1920 (R., V. 5, 2659-2823). Not a dime was allowed for the original acquisition cost of the leasehold. There is nothing in the Record that would indicate that this was anything other than an arm's-length transaction. There is no showing that the indirect relationship between Prairie

and Canadian had anything whatsoever to do with the determination of the purchase price. Certainly, it cannot be said from the Record that Moody was in a position to dominate, in any sense, the action of the majority of the Board of Directors.

The Commission also deducted $244,853.26, being interest during construction on the alleged excess over provable costs paid by Canadian to Amarillo (R., V. 1, 149, Entry 249; V. 5, 2769). Obviously, if the entire $5,000,000 purchase price is allowed, the interest during construction actually paid upon this amount should also be allowed.

The Commission also deducted an additional sum of $128,000, being an alleged profit made by Mission Oil Company over and above actual provable costs (Mission is one of the predecessors in title of Amarillo) (R., V. 1, 150; V. 5, 3043-3051). Obviously, this deduction should not have been made if the full $5,000,000 purchase price is allowed.

The sum of the above deductions or eliminations by the Commission aggregates the sum of $3,615,670, which is approximately 36% of the entire investment of Canadian in all of its properties (R., V. 1, 149) and almost 40% of the rate base determined by the Commission for Canadian in this case (R., V. 1, 164).

4. *Allocation.*
(Question 8).

As indicated on the Flow Map, Appendix B, Canadian has two general types of sales and businesses, i. e., (a) intrastate sales and business wholly within the State of Texas over which the Commission has no jurisdiction, and (b) interstate sales and business over which the Commission has limited jurisdiction. Canadian's interstate sales, substantially all of which are to Colorado Interstate, are again divided into two types of sales and businesses, i. e., (a) gas sold to Colorado Interstate for resale directly to its own pipe line consumers, such as Colorado Fuel and Iron Corporation and Colorado Portland Cement Company, over which the Commission has no jurisdiction (hereinafter sometimes referred to as "direct sales" or "direct sale gas"), and

(b) gas sold to Colorado Interstate for resale to distributing companies and others, such as Public Service Company of Colorado and City of Colorado Springs, for ultimate public consumption, over which the Commission does have jurisdiction (hereinafter sometimes referred to as "resale gas").

In arriving at its ultimate rate reduction order in this case, the Commission admits that it made no separation of Canadian's properties as between those used for its intrastate business and sales and those used for its interstate business and sales; likewise, it made no separation of Canadian's properties as between those utilized for direct sale gas and those utilized for resale gas. In lieu of such separation of properties, the Commission arrived at its ultimate rate reduction order through the application of a so-called cost of service allocation or formula submitted at the hearing by Commission witness Lyon and subsequently adopted by the Commission (Ex. 226; R., V. 4, 2317-2337, 2381-2384; Com. Op., R., V. 1, 175).

Both Canadian in its case and Colorado Interstate in its case (No. 379) introduced evidence before the Commission segregating and showing the portion of their respective properties, revenues, expenses and earnings subject to the Commission's jurisdiction and the portion not subject to the Commission's jurisdiction (R., V. 4, 2264-2355; V. 8, 5039-5044), all of which was ignored by the Commission. It is Canadian's contention that such a separation of properties was indispensable for the purpose of keeping the Commission within its jurisdictional limitations in accordance with the mandates of this Court.

In the application of the cost of service formula, Lyon, as well as the Commission, treated the properties of Canadian and Colorado Interstate as a unit, combining all their investments, costs and operations into one composite system (R., V. 4, 2317-2363-2399). The Commission's rate reduction orders, however, were entered against the separate properties and businesses of Canadian and Colorado Interstate and not against the composite pipe line system (R., V. 1, 176, 185-188).

Again, in the application of the cost of service formula

Lyon, as well as the Commission, assumed jurisdiction in the Commission over Canadian's production and gathering properties, facilities and business, as well as its transmission properties, facilities and business.

Canadian contends that the Commission's so-called allocation of cost of service is not a valid substitute for a proper separation of properties, revenues and expenses as between regulable and non-regulable business. It further contends that even if such a cost of service formula should be held to be a valid substitute in principle for a proper separation of such properties it is fallacious and invalid as applied in this case, as will be shown in the argument to follow on this question.

A portion of Canadian's intrastate sales consists of sales from its transmission line in Texas for distribution in the towns of Hartley, Dalhart and Texline, Texas. The cost of service for such sales, as determined by the application of Lyon's formula, completely ignored the fact that these towns were located in close proximity to the gas field and applied to them the same transmission cost factors as were applied for determining the cost of gas at Denver, Colorado. When effect is given to all adjustments made by the Commission, this resulted in a "cost" allocation for these Texas communities which was in excess of the amount actually received by Canadian for such gas (R., V. 4, 2317; V. 5, 2425).

In the application of their cost of service formula, both Lyon and the Commission have assumed that every foot of gas sold by Canadian is produced and gathered at precisely the same cost. In other words, they have given no consideration whatsoever to the load factors involved in serving direct sale customers or resale gas customers (R., V. 5, 2414-2415-2421).

All gas sold by Canadian to Colorado Interstate for the latter's direct sale customers is utilized for industrial fuel purposes, the demand for which is not greatly affected by weather or temperature conditions. Colorado Interstate's peak monthly demand at Clayton Junction for resale gas for ultimate public consumption during the winter of 1939-1940 was approximately 50% greater in volume than direct sale

gas (R., V. 8, 5045). Since the peak monthly demand for resale gas was approximately 50% greater in volume than direct sale gas, it follows, obviously, that the utilization of producing and gathering facilities by resale gas was likewise approximately 50% greater than by direct sale gas.

Canadian's total sales to Colorado Interstate at Clayton Junction during the year 1939 are divided as follows: Resale gas 10,974,156 Mcf (14.65-pound pressure base); direct sale gas and gas used by Colorado Interstate in its own operations 10,158,353 Mcf (14.65-pound pressure base). Canadian's sales to Colorado Interstate at Gray, Oklahoma, during the same period were 20,783,301 Mcf (R., V. 4, 2319). Gas sold by Canadian to Colorado Interstate at Gray, Oklahoma, was resold by the latter to Natural Gas Pipeline Company of America and the Record does not indicate what amount of such sales represents direct sale gas to pipe line consumers. It is clear, however, that approximately one-fourth of Canadian's total sales to Colorado Interstate are sold by the latter directly to its own pipe line consumers. Notwithstanding the fact that the Commission has no jurisdiction over such sales made by Colorado Interstate, the Commission's rate reduction order, nevertheless, purports to reduce the price of *all* gas sold by Canadian to Colorado Interstate, including direct sale gas.

As above stated, Lyon in his Exhibit 226, which was adopted and applied by the Commission, combined all properties of Colorado Interstate and Canadian and treated them as one composite system. This being true, in the consolidation, Lyon eliminated Colorado Interstate as a purchaser from Canadian and Canadian as a seller to Colorado Interstate. His exhibit contained no basis within itself for the determination of the cost of service of Canadian with respect to the gas sold by it to Colorado Interstate. The Commission, nevertheless, ordered a total over-all reduction with respect to all gas sold by Canadian to Colorado Interstate in the amount of $551,000 annually (R., V. 1, 176). It is the contention of Canadian that, in any event, there is no support in the Record for the Commission's action in this respect.

Reference is here made to the Statement of the Case in

the Brief of Colorado Interstate (No. 379) which Statement explains in detail the method followed by Lyon and the Commission in allocating "cost of service".

SPECIFICATION OF ERRORS.

1. The Commission erred in assuming and exercising rate regulatory jurisdiction in this case over Canadian's production and gathering properties, facilities and business, and the Circuit Court, after correctly ruling that the Commission did not have such jurisdiction, erred in concluding and ruling that the Commission in this case did not exercise prohibited rate regulatory jurisdiction over Canadian's production and gathering properties, facilities and business.

2. The Circuit Court erred in approving the action of the Commission in ignoring the market value of Canadian's natural gas as a commodity at the wellhead in the field and at the end of its gathering system, which is the beginning of the interstate transportation of said gas, and is not holding that the Commission should use such commodity value of said gas at the end of the gathering system as the Commission's jurisdictional starting point for rate regulatory purposes in this case.

3. Even assuming, *arguendo*, that the Commission does have rate regulatory jurisdiction over Canadian's production and gathering properties, facilities and business, the inclusion in the rate base of Canadian's natural gas leaseholds on the Commission's original cost or prudent investment theory or formula, to the exclusion of all evidence of value, market or otherwise, was improper, illegal, and in violation of the Natural Gas Act, and deprived Canadian of its property without due process of law, in violation of the Fifth Amendment to the Constitution of the United States.

4. Assuming, *arguendo*, that the Commission has rate regulatory jurisdiction over Canadian's production and gathering properties, facilities and business, and further assuming, *arguendo*, that it is proper in this case to include Canadian's leaseholds and wells in the rate base on the basis of original cost or prudent investment, the Commission and the Circuit Court nevertheless erred, contrary to the Fifth Amendment

to the Constitution of the United States and to the Natural Gas Act, in not finding that the full $5,000,000 paid in cash by Canadian to Amarillo for Amarillo's gas leaseholds, wells and rights constituted a prudent investment and part of Canadian's original cost.

5. Assuming, *arguendo*, that the Commission has rate regulatory jurisdiction over Canadian's production and gathering properties, facilities and business, and further assuming, *arguendo*, that it is proper in this case to include Canadian's leaseholds and wells in the rate base on the basis of original cost or prudent investment, the Commission and the Circuit Court nevertheless erred in disallowing and eliminating from the rate base $3,615,670.26, or any part thereof, of Canadian's actual original cost and prudent investment, contrary to the Fifth Amendment to the Constitution of the United States and the Natural Gas Act.

6. The Commission, in purporting to fix reasonable rates for gas sold by Canadian for resale in interstate commerce, and now subject to regulation by the Commission, violated the requirements of the Fifth Amendment to the Constitution of the United States and the Natural Gas Act when it treated Canadian's property and that of Colorado Interstate as a unit, and failed to make any separation of the property and expenses as between that applicable to interstate commerce and that applicable to the intrastate sale in Texas, or between that applicable to the sales for resale and that incident to the direct sales to Colorado Interstate's industrial customers over which the Commission has no jurisdiction; and the Circuit Court of Appeals erred in affirming the Order.

7. The Commission's "allocation of cost of service" is not a valid substitute for the required separation of property and expenses, in that it results in burdening non-regulable gas with costs actually incurred in the sale of the regulable gas, and in the regulation of business over which the Commission has no jurisdiction, contrary to the limitations of the Fifth Amendment and of the Natural Gas Act; and the Circuit Court of Appeals erred in affirming the Order.

8. The Commission erred in ordering a blanket reduction

in the rates of Canadian applicable to gas sold for resale in interstate commerce, as well as to gas sold in interstate commerce for direct sale in so far as the sales to Colorado Interstate are concerned, notwithstanding the fact that the Commission under the Natural Gas Act has no rate regulatory jurisdiction over gas sold in interstate commerce for direct sale to the ultimate consumer, and the Circuit Court of Appeals erred in affirming the Commission's Order.

9. For each and all of the reasons set forth in the foregoing specification the Circuit Court erred in affirming the Commission's Rate Reduction Order, and in not reversing, vacating, setting aside and holding said Order for naught.

ARGUMENT.

We shall present our argument in the numerical order of the "Questions Presented."

Question 1.

Exercise of Prohibited Rate Regulatory Jurisdiction Over Canadian's Production and Gathering.

It is submitted that all of the facts set forth in the Statement and its several subheadings are pertinent to this question.

We state here at the very beginning that we are not here questioning the inquisitorial powers granted to the Commission under Sections 5(b), 9(a), 10(a), 11(a), and 14(b) of the Act. It is, however, Canadian's contention that, notwithstanding the Circuit Court's ruling to the contrary, the Commission has exercised prohibited rate regulation over Canadian's production and gathering properties, facilities and business. In support of this contention the following is submitted:

(a) Section 1(a) of the Natural Gas Act declares the Congressional intent and sets forth the purposes of the Act "that the business of *transporting and selling* natural gas for ultimate distribution to the public is affected with a public interest, and that Federal *regulation* in matters relating to the *transportation* of natural gas and the *sale* thereof in interstate and foreign commerce is necessary in

the public interest." (Appendix A, infra, p. 89.) (Italics supplied.)

(b) Not only does the Act by Section 1(a) limit its scope and coverage to interstate transportation and sale of natural gas, but to foreclose all possibility of misconstruction or an unwarranted assumption of non-granted jurisdiction, Section 1(b) of the Act expressly provides that it "shall not apply to * * * the production or gathering of natural gas." (Appendix A, infra, p. 89.) Clearly the English language contains no words which could more positively express the Congressional intent than are found in these two subdivisions of the very first section of the Act.

(c) If aid to interpretation of the clear, positive and unambiguous language contained in Sections 1(a) and 1(b) of the Act is for any reason thought necessary or desired, it can be abundantly found in the legislative history of the Act where its sponsors, including the representatives of the Federal Power Commission, stated time and time again that the Act was not designed to and did not cover production and gathering. See statements of Mr. Dozier A. DeVane and Mr. Thomas J. Tingley, Solicitor and Assistant Solicitor, respectively, of the Federal Power Commission contained in the official report of "Hearing Before a Sub-Committee of the Committee on Interstate and Foreign Commerce, House of Representatives" in connection with the original H. R. 11662, pages 17, 28, 34, 35, 42, 43; statements of Chairman Lea, Congressional Record, Volume 81, Part 6, page 6721; and Senator Wheeler Congressional Record, Volume 81, No. 162, page 11981.

(d) This Court, in the Natural Gas Pipeline Company and Hope Cases, has approved actions of the Commission only because the Commission was found to have acted within the "ambit of its authority," and in the Hope Case (p. 287, Vol. 88 L. Ed., Advance Opinions) this Court stated:

> "* * * And the Federal Power Commission was given no authority over the 'production or gathering of natural gas.'"

Again, on page 289:

> "As we have said, the Act does not intrude on the

domain traditionally reserved for control by state commissions; and the Federal Power Commission was given no authority over 'the production or gathering of natural gas.'"

(e) The Circuit Court in its Opinion in this case (142 Fed. (2d), p. 952; R., V. 8, 5074, 5075), following the mandate of the Act and the ruling of this Court, correctly stated that "under Section 1(b) the Commission does not have express or implied rate regulatory jurisdiction of the production and gathering of gas," and that under Section 1 of the Act the production and gathering properties and facilities of petitioner, while part of its integrated operations, "lie beyond the range of the rate-regulatory jurisdiction of the Commission."

(f) We submit there is no room for interpretation contrary to the express language of the Act. Jurisdiction will not be implied. Before jurisdiction in any administrative commission is decreed, it must be clearly granted. If any conceivable ambiguity could be found in the Act, that ambiguity must be resolved against jurisdiction.

The above statements are so uniformly sustained by the authorities, both Court and Commission, that mere citation of a few of them should suffice without quotation.

Express Companies, 1 I. C. C. 349;
Nickel Plate Case, 79 I. C. C. 581;
Acme Fast Freight, Inc., 2 M. C. C. 415.

(g) Inasmuch as the Circuit Court has definitely ruled, as a matter of law, that the Commission does not have express or implied rate regulatory jurisdiction of the production and gathering of natural gas, and the Respondents, or any of them, have not, by petition for writ of certiorari, attacked that ruling, such ruling is the law of this case, and we start with such adjudicated law that under the Act the Commission does not have rate regulatory jurisdiction over Canadian's production and gathering properties, facilities and business.

(h) In view of the express and positive provisions of the Act, the legislative history thereof, the ruling of this Court in the Hope Case quoted above, and the quoted language from the Circuit Court's Opinion, we are absolutely unable by recourse either to reasoning or imagination, to justify the lower court's ruling that what the Commission did in this case does not constitute a usurpation of rate regulatory jurisdiction over production and gathering so universally recognized as being expressly withheld from the Commission. The Commission itself makes no contention that it has not exercised rate regulatory jurisdiction over Canadian's production and gathering, but attempts to justify its action on the theory that an exercise of such jurisdiction is indispensable, although not granted by Congress, to a proper exercise of its delegated rate regulatory jurisdiction over interstate transportation and sale of natural gas. That this contention is without merit and that the Commission did in this case exercise prohibited rate regulatory jurisdiction over production and gathering are demonstrated by the following paragraphs:

(i) Mining operations, which include production of natural gas, have been uniformly held by this Court to be local in nature and not to constitute interstate commerce even though the product mined is destined to be shipped in interstate commerce.

Corporation Commission of Oklahoma v. Champlin Refining Co., 286 U. S. 210, 76 L. Ed. 1063;

Thompson v. Consolidated Gas Utilities Corp., 300 U. S. 55; 81 L. Ed. 510;

Heisler v. Thomas Colliery Co., 260 U. S. 245, 67 L. Ed. 237;

Oliver Iron Mining Co. v. Lord, 262 U. S. 172, 67 L. Ed. 929;

Carter v. Carter, Coal Co., 298 U. S. 238, 80 L. Ed. 1160;

Hope Natural Gas Co. v. Hall, State Tax Commissioner of West Virginia; 274 U. S. 284, 71 L. Ed. 1049;

Jersey Central Power & L. Co. v. Federal Power Commission, 319 U. S. 61, 87 L. Ed. 1258.

(j) The fact that the production and gathering may affect interstate commerce does not vest rate regulatory jurisdiction in the Commission over production and gathering as the Natural Gas Act is different from other acts adopted in recent years which vested jurisdiction in commissions where the subject-matter of the act "affected" or "burdened" or "obstructed" interstate commerce.

National Labor Relations Board v. Jones & Laughlin Steel Corp., 301 U.S. 1, 81 L. Ed. 893. (National Labor Relations Act);

Sunshine Anthracite Coal Co. v. Adkins, 310 U.S. 381, 84 L. Ed. 1263. (Bituminous Coal Conservation Act);

United States v. F. W. Darby Lumber Co., 312 U.S. 100, 85 L. Ed. 609. (Fair Labor Standards Act.);

Federal Trade Commission v. Bunte Bros., Inc., 312 U.S. 349; 85 L. Ed. 881. (Federal Trade Commission Act);

California Rice Industry v. Federal Trade Commission, (C.C.A. 9, 102 Fed. (2d) 716), (Federal Trade Commission Act);

A. B. Kirschbaum v. Walling, 316 U.S. 517, 86 L. Ed. 1638, 1646. (Fair Labor Standards Act);

Walling v. Jacksonville Paper Co., 317 U.S. 564, 87 L. Ed. 460. (Fair Labor Standards Act);

Public Utilities Commission of Ohio v. United Fuel Gas Co., 317 U.S. 456, 87 L. Ed. 1162. (Federal Power Commission.)

While Congress may have the power to regulate matters *affecting interstate* commerce as well as matters in *interstate commerce*, all the above cases make it absolutely clear that Congress does not have to exercise its full power, and that where it only delegates jurisdiction over matters *in interstate commerce*, such jurisdiction cannot be extended so as to include matters which may be said to *affect interstate commerce*. It is for Congress, and not for the created commissions or the courts, to decide what jurisdiction should be delegated, and, as stated by the lower court in its Opinion in this very case, "the Commission does not have *express or implied* rate regulatory jurisdiction of the production and gathering of gas." (Italics supplied.)

In view of the exclusive language of the Act, it is clear that Congress did not leave, or intend to leave, any discretionary power with the Commission to determine in what cases it should or should not exercise rate regulatory jurisdiction over production and gathering. As we shall hereinafter point out, there is no merit from a factual standpoint in the Commission's contention that an exercise of rate regulatory jurisdiction over production and gathering is indispensable to an exercise of delegated rate regulatory jurisdiction over interstate transportation and sale. Furthermore, it is legally immaterial that the Commission thinks that rate regulatory jurisdiction over production and gathering is indispensable to an exercise of its delegated rate regulatory jurisdiction over interstate transportation and sales because Congress has decided that question by withholding such jurisdiction from the Commission, and it is not for the Commission to override the express Congressional declaration of intent. A similar contention that an exercise of an undelegated power was necesary in order successfully to carry out a delegated power was refuted in the following clear language by the Supreme Court of Texas in *Humble Oil & Refining Co., et al. v. Railroad Commission of Texas*, 133 Texas 354, 128 S.W. (2d) 9, 15:

"It seems to be argued that our gas utility statutes, by

necessary implication, confer the power on the Commission to fix the price of gas where it is sold by the producer on the premises of production to a public gas utility. We think that the power to fix prices and make rates by a board or commission is not to be taken as conferred by implication. Such power must be conferred under statutory or constitutional language that is free from doubt, and that admits of no other reasonable construction. Commercial Standard Ins. Co. v. Board of Ins. Com., Tex. Civ. App., 34 S. W. 2d 343, writ refused; Siler v. Louisville & N. R. Co., 213 U. S. 175, 193, 29 S. Ct. 451, 53 L. Ed. 753. These authorities could be multiplied many times, but they are sufficient. Certainly, it cannot be said that our gas utility statutes, in clear and unmistakable language, confer the power on the Commission to fix prices or rates which private gas producers shall charge public gas utilities.

"It is contended by counsel for the Commission that the power of the Commission to fix the price at which a mere producer of gas must sell his product to a public gas utility, even though such gas is sold at the point of origin, should be upheld because the Commission will be greatly hampered and circumscribed in regulating gas utility rates or prices if it cannot also fix the rates or prices that producers charge such utilities for the gas sold thereto. A full answer to this contention is to point to the fact that no statute has conferred such power on the Commission. Furthermore, the same argument could be used to sustain the power of the Commission to fix prices for all articles, things, and services sold to public gas utilities. Everything that the utility may lawfully purchase must be taken into consideration in fixing the ultimate gas utility rate. We grant that gas utility rates might more effectively be controlled if private gas producers could be compelled to sell gas to such concerns at prices determined and fixed by the Commission; but, as already indicated, that fact does not justify a court in upholding such a power in the absence of any sort of statutory authority. • • •"

(k) As stated at the very beginning of this argument, we are not questioning the inquisitorial powers granted by the Act to the Commission in the only sections of the Act in

which production or gathering are mentioned, which inquisitorial or investigation power, however, clearly has no connection with any rate regulatory power. Thus, Section 5(b) only empowers the Commission, either upon its own motion or upon the request of any state commission, to "investigate and determine the cost of production and transportation of natural gas by a natural-gas company in cases where the Commission has no authority to establish a rate governing the transportation or the sale of such natural gas." Section 9(a) relates to methods of keeping accounts, and particularly to depreciation and amortization accounts. Section 10(a) merely requires the filing of reports. Section 11(a) is in aid of legislation and state compacts. Section 14(b) gives the Commission power to investigate or determine the adequacy or inadequacy of gas reserves. This subsection is a part of the entire Section 14, headed, "Investigations by Commission; Attendance of Witnesses; Depositions," thus showing that the purpose of the section is to authorize investigations in order to aid the Commission in exercising its delegated powers. These sundry inquisitorial powers, as stated by the Circuit Court in its Opinion in this case, vest in the Commission no express or implied rate regulatory jurisdiction over production and gathering.

(1) As shown in the Statement and as found by the Commission, (R., V. 1, p. 143), as of December 31, 1939, Canadian held gas leaseholds on approximately 300,000 acres of land located in the Texas Panhandle Field in the State of Texas, on which it had in operation a total of 94 gas wells. Its gathering system consisted of 144 miles of various size of pipe, all located in the State of Texas. The gathering system has two termini. One terminus is located at what is known as the Bivins Station in the State of Texas. At this point the gas there gathered is compressed and then transported by Canadian through its own transmission pipe line to Clayton Junction, near Clayton, New Mexico, at which point it sells the gas so transported to Colorado Interstate, and the latter company then transports such gas through its "Denver Line" and sells the same at various points in the State of Colorado. The other terminus of Canadian's gathering system is located at what is known as Fritch Station,

also in Texas. At this point the gas there gathered is compressed and then transported by Canadian through facilities leased from Texoma Natural Gas Company to a point in Oklahoma known as Gray Junction where the gas so transported is also sold to Colorado Interstate. This general picture is disclosed on the Flow Map attached hereto as Appendix B.

As shown from the above and as stated by the Commission in its Opinion (R., V. 1, p. 143), it thus appears that Canadian is engaged in several different and distinct business operations or functions: (a) Production, (b) gathering, (c) transportation, and (d) sale of natural gas. In addition to the sale of natural gas to Colorado Interstate at Clayton Junction, New Mexico, and at Gray, Oklahoma, Canadian also sells natural gas to Amarillo Oil Company at the wells in the field for the City of Amarillo and the Town of Channing, Texas, and along its pipe line for the Dalhart, Hartley and Texline, Texas, markets. It also sells a small quantity of gas to Clayton Gas Company, with deliveries at the Clayton, New Mexico, town border. (R., V. 2, p. 708.)

The gas sales made by Canadian to Colorado Interstate are pursuant to a term contract between the two companies, dated January 3, 1928. (Ex. 16, R., V. 2, pp. 711-780.) It is the over-all compensation which Canadian is entitled to receive under this contract, including, among other things, the cost of current deliveries of gas as a commodity, which the Commission, by its rate reduction order, requires to be reduced in the amount of $551,000 annually. Among other things, this contract, known as the Cost Contract, for the compensation therein provided to be paid Canadian and which compensation has been reduced to the extent above stated by the Commission's order, requires Canadian to acquire, maintain and develop a substantial block of gas leaseholds, to drill and operate wells, to construct and operate gathering facilities, to pay off funded debt in fixed amounts at fixed times, and to sell gas to others only as permitted by Colorado Interstate.

(n9) An important fact in consideration of the question presented here is that there is a commodity market value for Canadian's natural gas in the field where produced and at

the end of the gathering system termini. The uncontradicted evidence in this case establishes the market value of Canadian's gas at the wellhead in the field at 4c per Mcf. (16.4-pound pressure base) and the fair market value of natural gas gathered and delivered at the Bivins Station (one terminus of the gathering system and the beginning of the transportation system) to be 7c per Mcf. (16.4-pound pressure base.)

We respectfully but earnestly submit that the Commission could keep within its delegated jurisdiction over interstate transportation and sale and not usurp an undelegated jurisdiction over production and gathering by using the commodity value of Canadian's natural gas at the end of the gathering system, which is the beginning of the interstate transportation system, as its jurisdictional starting point. The existence of a commodity value of the gas is in itself a complete answer to the Commission's contention that rate regulatory jurisdiction over the production and gathering properties, facilities and business, although withheld by Congress, is indispensable to an exercise of its delegated rate regulatory jurisdiction over interstate transportation and sale. So this case, or any similar case, need not be approached with the apprehension that if the Congressional mandate is followed and the Commission denied the right to exercise rate regulatory jurisdiction over production and gathering, the Commission will be unable properly to fulfill its delegated duties over interstate transportation and sale.

(n) As indicating the all-inclusive jurisdiction exercised by the Commission in this case over all of Canadian's properties, facilities and business, including not only its interstate transportation and sale but also its production and gathering, the following facts from the Record, summarized in the Statement, supra, are reiterated:

1. In arriving at its rate reduction order the Commission determined a rate base which includes not only Canadian's interstate transmission system but also its production and gathering properties. (R., V. 1, pp. 144-195; V. 5, pp. 2717-2721.)

2. In determining its rate base for Canadian's producing

and gathering properties the Commission applied its so-called original cost or prudent investment theories and in so doing totally ignored the true value of such properties as well as the actual cost thereof to Canadian.

3. In its rate base for production and gathering properties the Commission determined and included an allowance for working capital which it deemed sufficient to enable Canadian to carry on its production and gathering operations, and likewise the Commission has purported to determine in its rate base for production and gathering properties what additional wells should be drilled and what additional gathering facilities should be installed in the future. (R., V. 5, pp. 2530-2556.)

4. After finding Canadian's total rate base to be $9,375,000 (R., V. 1, 187), of which approximately two-thirds represents production and gathering properties, (R., V. 5, 2717-2721), (even on the Commission's basis of determining a rate base), the Commission then found that Canadian was entitled to a return of 6½% per annum upon its total rate base (R., V. 1, 187), more than two-thirds of which, as above stated, is attributable to the hazardous business of discovering, exploring, developing and operating natural gas production properties.

5. The Commission has determined and made an allowance for Canadian's total annual operating expenses (including depreciation and depletion), the greater portion of which represents the cost of producing and gathering natural gas. (R., V. 1, 171; V. 4, 2341-2345.)

6. After determining the total annual income of Canadian from all sources, the greater portion of which represents the cost of producing and gathering natural gas under its Cost Contract with Colorado Interstate, the Commission has deducted its determined annual operating ex-

---

The Commission deducted $3,864,357 from Canadian's original costs, practically all of which is applicable to leaseholds. (R., V. 1, pp. 149-151) This is discussed under "Question 3" infra. The Commission included Canadian's bare leaseholds in its original cost rate base at a value of something less than $1,000,000, and in so doing totally ignored uncontradicted evidence of the present market value of such leaseholds in excess of $15,000,000. (See Statement, pages 19-21, supra. This is discussed under "Question 2" infra.)

penses (mostly production and gathering) from such total income, and then, after making a return allowance of 6½% upon its determined rate base (mostly production and gathering), it has found an alleged over-all excess income being received by Canadian, which forms the basis for its rate reduction order.

7. The Commission has applied its "allocation of cost of service" theory or formula to Canadian's production and gathering properties, facilities and business in the same manner as to its interstate transportation and sales and the properties, facilities and business connected therewith. This is discussed in detail under "Question 8," infra.

8. The Commission's Order changes and abrogates the amount of compensation which Canadian is entitled to receive from Colorado Interstate under its Cost Contract, which compensation represents cost reimbursement to Canadian not only for the cost of current deliveries of gas to Colorado Interstate, but also for the cost of performing various other services under the Cost Contract relating to Canadian's production and gathering properties and operations, such as the maintenance of leaseholds, the drilling of wells and the construction of gathering facilities as directed by Colorado Interstate.

(o) Notwithstanding all of the above and its own ruling that the Commission does not have either express or implied rate regulatory jurisdiction over production and gathering, the Circuit Court, in its Opinion, (142 Fed. (2d), p. 952—953; R., V. 8, 5074, 5075) sustained the Commission's rate reduction order upon a novel theory, therein attempted to be explained, that the action of the Commission does not constitute rate regulation of Canadian's production and gathering.

The Commission itself, either in its own Opinion or in its briefs filed in the Circuit Court or in this Court in connection with the petition for writ of certiorari, contends for no such theory, but admits that it did exercise rate regulatory jurisdiction over Canadian's production and gathering and claims to possess such jurisdiction.

We respectfully submit that while the Circuit Court in

one breath nominally purports to reject the Commission's jurisdictional contention, it does in its final and effective breath sustain the Commission's position notwithstanding the clear and positive provisions of the Act and the holding of this Court in the Hope Case. We submit it approaches absurdity to state that the Commission does not have rate regulatory jurisdiction over production and gathering and at the same time to rule that rate regulatory jurisdiction is not exercised where the Commission includes production and gathering properties in a rate base; where it applies its own formula of original cost or prudent investment to production and gathering properties; where it includes production and gathering expenses in its estimate of future expenses; where it allows working capital for the production and gathering business; and considers and determines what wells are to be drilled in the future; and finally, where, in determining an alleged excess revenue, it applies its allocation of cost of service formula or theory, including a 6½% rate of return, not only to the transmission system properties but also to the production and gathering properties which constitute approximately two-thirds of the total rate base as determined by the Commission. Obviously, the Commission has treated every element of Canadian's production and gathering properties, facilities and business in precisely the same manner as its interstate transmission properties, facilities and business, and has subjected every element of Canadian's production and gathering facilities to the same rate regulatory measures and procedures as Canadian's interstate transmission properties, facilities and business for the purpose of arriving at its ultimate conclusions with respect to rates and charges. If the Act had expressly delegated full and complete rate regulatory jurisdiction over Canadian's producing and gathering properties, facilities and business, the Commission could have done no more than it has done in this case. The Circuit Court's Opinion is inconsistent and contradictory. Its effect, not only in the instant case but also in all other cases, if allowed to stand, is to vest complete rate regulatory jurisdiction over production and gathering and thus to assume and exercise a legislative veto power over an express and unambiguous Act of Congress.

We again emphasize that natural gas is a commodity; that the market value of that gas as a commodity at the wellhead and at the end of Canadian's gathering system, which is the beginning of its interstate transmission system, was established by uncontradicted evidence. The whole theory and purpose of the Act and the express Congressional intent set forth therein can be sustained, served and followed if this established commodity value of the natural gas be used as the starting point of the Commission's rate regulatory jurisdiction. In such event by using that commodity value as its jurisdictional starting point the Commission can properly proceed with an exercise of its delegated rate regulatory jurisdiction over the interstate transportation and sale of that gas.

In conclusion, we urge that the Commission's action in this case and the Circuit Court's affirmance thereof are in direct conflict wtih the Act and with the Opinion of this Court in the Hope Case, and that the Commission's unwarranted assumption of rate regulatory jurisdiction over Canadian's production and gathering should not be allowed to stand. If the Commission's action is permitted to stand, then the provision of Section 1(b) of the Act that the Act shall not apply to production or gathering has become merely surplusage and is a nullity.

Question 2.

Impropriety and Invalidity of Including Natural Gas Leaseholds in a Rate Base on an Original Cost Formula or Prudent Investment Theory.

While some of the specific facts in the Record pertinent to a consideration of Question 2 are summarized in the Statement under that separate subheading, all of the facts set forth in the entire Statement are more or less pertinent to a consideration of the question presented by Question 2; namely, the impropriety and invalidity of including natural gas leaseholds in a rate base (even assuming Commission rate regulatory jurisdiction over such leaseholds) on an original cost formula or prudent investment theory.

It is our definite position, raised in Question 1, that the Commission does not have rate regulatory jurisdiction over

the production and gathering of natural gas and that its delegated jurisdiction over interstate transportation and sale can be fully, adequately and properly exercised by determining the commodity value of the natural gas at the end of the gathering operation, which is the beginning of the interstate transportation. This clearly was the Congressional intent in expressly withholding rate regulatory jurisdiction over production and gathering from the Commission. Such a logical and practicable procedure would render it unnecessary to rely upon the inconsistent and contradictory subterfuge found in the Circuit Court's Opinion quoted above which denies jurisdiction and upholds Congress with one hand and at the same time legislates jurisdiction and thwarts Congress with the other hand.

Even, however, if it be assumed, *arguendo*, that by whatever name it may be called, rate regulatory jurisdiction is to be exercised over production and gathering, still we submit it is entirely improper, for various reasons hereinafter mentioned, to include natural gas leaseholds in a rate base at original cost and to allow only a return based upon such original cost.

We are not arguing here the question as to whether for the ordinary class of public utility property, original cost or something else should be the foundation of the rate base. Natural gas leaseholds constitute a class of property unique in itself and what may be a permissible or logical theory of a rate base for the ordinary utility property can have no proper application to gas leaseholds. Certainly there is nothing in the Act which requires the Commission to use original cost in including natural gas leaseholds in a rate base, even assuming that the Commission has rate regulatory jurisdiction over those leaseholds. Again, when this Court in the Natural Gas Pipeline and Hope cases stated that the Commission is not bound to any single formula or combination of formulas, it certainly did not intend to limit the Commission to an original cost formula in all cases. On the contrary, the "end result" and "rate impact" principles announced by this Court in these two cases would seem to make it absolutely clear that an original cost rate base as applied to natural gas leaseholds is

not only in conflict with the basic theory of the Natural Gas Pipeline and Hope cases but condemned by the "rate impact" and "end result" principles announced therein.

We submit that, except in an isolated instance as the result of accident, an original cost rate base as applied to natural gas leaseholds can never be fair to either the owner of the leaseholds or the public, and cannot, except accidentally, result in just and reasonable rates, as required by the Act. This can be demonstrated by a few general examples before coming to the particular situation which exists in the instant case.

A gas company, with $10,000,000 capital to spend in attempting to secure production, spends $9,000,000 of it around the country in geologizing, leasing, and drilling, without success. With its last million dollars it acquires some leaseholds which prove productive. Under the Commission's original cost theory the company would be limited to a 6½% return on this last million dollars. No consideration at all is given to the fact that it actually cost the company $10,000,000 to secure this one producing field. Such a theory must necessarily retard, if not eventually entirely terminate, attempts to locate and develop new fields, to the obvious prejudice of the general public.

Again, A acquires a section of purely "wildcat" land in unproven territory at a nominal cost of $1,000. He drills and secures gas production. This success immediately makes all surrounding land more valuable. B then acquires a gas lease on an adjoining section, but, because of the increased value resulting from A's discovery, B is required to pay $100,000 for his lease. B drills and is likewise successful. The gas produced from both leases as a commodity and on a competitive basis is of the same market value per Mcf. Under the Commission's original cost theory, A will be allowed a return of 6½% on only $1,000, while B will be allowed a return of 6½% on $100,000, and thus as far as the inclusion of the leaseholds in a rate base is concerned, the consuming public will be required to pay one hundred times as much for B's gas as for A's, even though they both have the same commodity value per Mcf.

This theoretical example just given is reflected by the actual facts appearing in the Record in this case. As shown from the Statement, Canadian's leasehold acreage was included by the Commission in its rate base on a "wildcat" original cost basis representing the nominal cost paid for the leaseholds, to a large extent before discovery of gas. In some instances what have turned out to be the most valuable leases were acquired in consideration of a drilling obligation only. The result is that all of Canadian's leaseholds, aggregating some 300,000 acres, have been included by the Commission in its rate base at an aggregate of less than $1,000,000 (exclusive of drilling cost). Five of its most important leaseholds, containing approximately 47,000 acres, have been included in the rate base by the Commission for only $4244.24, which is less than 10c per acre; and three of these leases are included at *zero valuation*. (R., V. 5, 2735, 2736, 3054.) The present fair value of these same five leaseholds (exclusive of wells) was $3,345,923. A similar situation exists in respect to the Commission treatment of the remainder of Canadian's leaseholds.

As against this practically nominal "original cost" of Canadian's leaseholds acquired on a "wildcat" basis, the Record shows that along about the year 1930 or 1931 Texoma Natural Gas Company* purchased a block of acreage approximating 300,000 acres in the Texas Panhandle Field at a total purchase price in excess of $15,000,000, the consideration paid running from $40 to $45 per acre. (R., V. 6, 3215, 3216.) Obviously the commodity value of the gas of the Texoma Natural Gas Company and the gas of Canadian is the same per Mcf., and yet the Commission's theory of including natural gas leaseholds in a rate base at original cost and allowing a return on such original cost would mean that Texoma would receive a return on from $40 to $45 per acre, and Canadian, a return on from zero value per acre to a maximum of $1 to $3 per acre. It would also mean that the rates to be charged the consuming public would be proportionately increased if the Texoma gas was purchased rather than Canadian's gas, notwithstanding

*Texoma Natural Gas Company was a party to and its properties were involved in the Natural Gas Pipeline Company case.

that in the field and at the end of the gathering operations the commodity value of the gas of both companies is the same. The absurdity of this result is apparent.

A final example: A, mentioned above, with his $1,000 leasehold investment, develops a property containing a reserve of, say 50,000,000 Mcf. B, with his $100,000 investment, develops a reserve of 5,000,000 Mcf. Certainly, notwithstanding the difference in the leasehold investment or original cost, A's property is much the more valuable, and yet again, under the Commission's original cost theory, A will be limited to a 6½% return on his $1,000 as against one hundred times that much for B.

We submit that such a blind application of the Commission's original cost theory is unsound, impracticable, violative of the Fifth Amendment, must necessarily result in untold confusion, and cannot possibly result in just or reasonable rates either from the viewpoint of the owner of the leaseholds or the consuming public.

Of course, as we have urged above, this whole question can be avoided and order brought out of chaos if the Commission shall keep within its delegated jurisdiction and not attempt to include production and gathering properties in a rate base, but use the market value of the gas as a commodity as its jurisdictional starting point.

The impropriety, from legal, economic and practical standpoints, of applying ordinary public utility rate regulation principles and formulas to natural gas leaseholds and valuing such leaseholds for rate base purposes on an original cost basis, and the propriety of using the commodity market value of the gas as the jurisdictional starting point, are clearly and forcibly pointed out and emphasized in the opinion of Mr. Justice Jackson in the Hope Case.

In connection with our argument on "Question 3" infra we set forth the details of the actual original cost or prudent investment formula or theory promulgated and applied by the Commission in its valuation of Canadian's leaseholds for rate base purposes and the Commission's elimination of over $3,000,000 from Canadian's actual origi-

nal cost of those leaseholds. The argument there presented further demonstrates, we submit, the impropriety, from legal, economic and practical viewpoints, of ignoring, as a matter of law, all elements of value of natural gas leaseholds other than the original cost of those leaseholds incurred by predecessor companies on a "wildcat" acreage basis, and, in fact, emphasizes the impropriety, both from the viewpoint of the owners of the leaseholds and of the consuming public, of using original cost at all for natural gas leasehold rate base purposes.

The following additional facts summarized in the Statement, supra, further emphasize and clearly show the impropriety, if not the illegality and unconstitutionality, of including natural gas leaseholds in a rate base at original cost, even though that original cost be properly determined, which it was not in this case, as we show in our argument on "Question 3."

An analysis of the testimony of Commission witnesses, which the Commission adopted substantially (Ex. 146, Sheets 62-64; R., V. 5, 2717-2721), shows that the Commission used the sum of $1,604,020.61 as the starting point for its findings as to original cost of or investment in Canadian's leaseholds as of December 31, 1939. Then, as appears from Paragraph 8 of the Commission's formal findings (R., V. 1, 186), a deduction of $653,681 was made for depletion. This means that Canadian's bare leaseholds have been included in the Commission's original cost rate base at a value of something less than $1,000,000.

In adopting this valuation for rate base purposes, the Commission has wholly ignored substantial and uncontradicted evidence that "the present market value of Canadian's leaseholds" (excluding wells) is the sum of $15,646,787.64.

The Commission has found that Canadian's recoverable gas reserves are 2,800,000,000 Mcf. (R., V. 1, 159.) Reducing these figures so found by the Commission to its *value of the gas in place*, it appears that the Commission, in effect, has found the present value of the gas in place to be only 34/1000ths of one cent per Mcf. On a comparative basis,

and using the $15,646,787.64 valuation as applied to the Commission's finding of 2,800,000,000 Mcf. recoverable reserves the value of the gas in place is approximately 1.3¢ per Mcf.

The Commission has wholly ignored all evidence of the market value of gas at the wellhead in the Texas Panhandle field as a measure of the value of said leaseholds. The uncontradicted evidence, as shown in the Statement, established such a commodity market value of 4¢ per Mcf. on a 16.4-pound pressure base, or not less than 3.6¢ per Mcf. on a 14.65-pound pressure base. Likewise, the Commission totally ignored the uncontradicted evidence which established the market value of Canadian's gas as a commodity at the Bivins Station (end of the gathering lines and beginning of the interstate transmission line) to be 7¢ per Mcf. on a 16.4-pound pressure base, or approximately 6.3¢ per Mcf. on a 14.65-pound pressure base.

The Commission has found that Canadian's remaining recoverable reserves as of December 31, 1939, are not less than 2,800,000,000 Mcf. (14.65-pound pressure base); that Canadian's future rate of production will be approximately 55,000,000 Mcf. (14.65-pound pressure base) per year; (R., V. 1, 159); and that on that basis Canadian's recoverable reserves will last for 53 years. The gross value of the 55,000,000 Mcf. to be so produced annually at 3.6¢ per Mcf. is $1,980,000. The Commission has found (R., V. 1, 171) Canadian's total annual operating expenses to be $1,169,096, which includes gathering expense and transmission expenses, as well as producing expense. Even if all of this expense, however, be attributed to the production of gas at the well-head and be deducted from the gross annual value of $1,980,000, there remains a net income of $810,904 (based upon commodity value) for Canadian's gas production in one year, which is almost as much as the Commission has allowed in the rate base for the total of Canadian's leaseholds for all time.

It happens in this particular case that the application of the Commission's original cost theory to Canadian's gas leaseholds operates to the prejudice of Canadian. It might well be the other way in another case, in which event if

the Commission is consistent, the consuming public would be compelled to pay a higher rate because of a high original cost, notwithstanding the fact that the market value of the gas as a commodity would be the same, irrespective of the original cost of the leaseholds.

We submit that any theory which must end in such absurd results is inherently unsound, is not in the public interest, and is in conflict with the Fifth Amendment and violative of the principles announced by this Court in the Natural Gas Pipeline and Hope cases. As the Commission's rate reduction order (even assuming, *arguendo*, rate regulatory jurisdiction in the Commission over production and gathering) is based upon such an unsound theory, it should not be permitted to stand.

Question 3.

Canadian's Actual Original Cost of Leasehold Properties.

The Commission did not question the fact that Canadian had actually invested in its gas properties the sum of $14,648,821 in cash as of December 31, 1939. (R., V. 1, 149.) It deducted from such actual cash investment, for its rate base purposes, however, the sum of $3,370,817 on the ground that such sum represented "affiliated company profits." (R., V. 1, 149.) It also deducted, in addition thereto, the sum of approximately $245,000 representing interest during construction on such alleged profits.[1] (R., V. 1, 149-151.)

Virtually the full amount of such deduction arises out of the transaction heretofore related in which Canadian acquired from Amarillo all of the latter's gas leaseholds, rights and wells as of May 1, 1927, for the sum of $5,000,000 for the purpose of inaugurating the Denver Project in 1928.[2]

[1] The Commission actually deducted $366,507 for interest during construction. (R., V. 1, 149) Of this amount, however, only $244,853.26 represented interest during construction on the alleged profit in the sale of leaseholds, rights and wells to Canadian. (Entry 249, R., V. 5, 2769). The remainder of the deduction for interest during construction as determined by the Commission resulted from a finding that the construction period terminated on July 1, 1928, rather than October 31, 1928, as contended by Canadian. (R., V. 1, 151)

[2] See Statement, pp. 10, 11, 21-26, supra.

The Circuit Court, in upholding the Commission in this deduction, stated that the purchase price paid constituted a "synthetic inflation." (R., V. 8, 5082.)

Having thus denied and deprived Canadian of its actual cash investment of $5,000,000 in gas leaseholds, rights and wells, the Commission then proceeded to limit Canadian for rate base purposes to its conception of the bare provable costs incurred by Amarillo and its predecessor in title for such properties. Following this practice, the Commission found that Amarillo, commencing with its "wildcat" discovery well in 1918, had invested in the properties sold to Canadian only the sum of $1,879,504 and that this sum should be further reduced by $128,534 by reason of an alleged profit of another predecessor company (Mission Oil Company) in a sale of property by it to Amarillo (R., V. 1, 150), all of which resulted in a so-called original cost to Amarillo of approximately $1,750,000, or approximately $3,250,000 less than the sum actually paid by Canadian in cash for such properties. In order to arrive at the true amount of the deduction, there should be added, of course, interest during construction on said sum for the construction period as determined by the Commission.

Based upon the facts heretofore and hereafter summarized, Canadian contends that the Record in this case establishes beyond question the following:

1. *The consideration paid by Canadian to Amarillo for such properties, and other terms and conditions of sale, as well as the agreement to buy and sell, were determined and agreed to by the three non-affiliated organizers of the Denver Project after prolonged arm's-length bargaining, long before formal consummation of the transaction and even prior to the incorporation of Canadian itself.*

Payne, who represented Standard in the negotiations which resulted in the acquisition of the gas leaseholds, rights and wells of Amarillo by Canadian, stated:

"The terms were agreed upon (contract of April 5, 1927, Exhibit 1) only after a series of conferences at which various plans were considered and the viewpoints of all the parties were put forward and thoroughly dis-

cussed. Since Standard Oil was assuming the responsibility of putting up the money for the project, we exercised the utmost care and our best judgment in all of the matters under consideration, and the willingness of the company (Standard) to proceed with this project depended entirely upon the basis agreed to by the parties.'" (R., V. 1, 493.)

Payne further stated that this led to prolonged negotiations and at times it seemed that an agreement would never be reached. (R., V. 1, 519-522.)

The first proposition advanced by Standard for the Denver Project included the purchase of the properties of some other subsidiaries of Southwestern in Texas. This proposition was rejected by Southwestern. (R., V. 1, 519.) Standard then proposed the purchase of the gas wells and leaseholds of Amarillo for the sum of $2,000,000, being $1,250,000 in cash and stock with a par value of $750,000. This was rejected by Southwestern. The various propositions advanced by Southwestern from time to time on behalf of Amarillo for its gas leaseholds, rights and wells were $15,000,000 in cash; then $10,000,000; and finally $7,500,000. (R., V. 1, 520.) The negotiations started in July of 1926 and continued into October of that year. Standard finally increased its proposal to $4,000,000 in cash with a fifty-fifty division of the common stock in the project. This was refused by Southwestern. (R., V. 1, 520.) Standard's last proposal was to pay $5,000,000 in bonds and $1,000,000 in cash. This was rejected by Southwestern.

In October, 1926, Southwestern made a counter-proposal involving a payment of $5,000,000 in cash to Amarillo for its gas leaseholds, rights and wells. This proposition was finally accepted in principle (R., V. 1, 520-521), and incorporated in the Memorandum of Stipulations executed by Southwestern, Standard and Cities Service as of April 5, 1927. (Ex. 1, R., V. 1, 381-401.)

The intensity of the bargaining by the parties over the price to be paid for Amarillo's gas leaseholds, rights and wells is further exemplified by the following testimony of Payne:

"Q. Were you in the position of making a trade with these people (Southwestern) as to the dollars that would be paid for these leases and wells which would go into the cost of the project?

"A. Certainly. My attitude * * * was that we wanted to make the pipe line project a financial success and an honorable credit. It was our effort, therefore, *to buy those leases at the lowest possible figure* that went into the project.

"On the other hand, Mr. Fitzpatrick and Mr. Moody (representing Amarillo), * * *, *were particularly and more vitally interested in getting as much cash as possible from the sale of those properties.*" (Italics supplied.). (R., V. 1, 524.)

Spencer, Vice President of Southwestern, testified as follows:

"Q. Mr. Spencer, a number of questions have been asked concerning a figure of five million dollars. Do you know if that figure was fixed, namely, the amount that the leases which went into this project from the Amarillo Oil Company was fixed in some document prior to the time when the Canadian River actually made the purchase?

"A. A consideration of five million dollars to be paid and paid by Canadian River to Amarillo Oil Company for its gas rights and properties was fixed in the pre-organization agreement dated April 5, 1927 between Southwestern, Standard and Cities Service."

Spencer then identified Exhibit 1, Memorandum of Stipulations of April 5, 1927, as the pre-organization agreement referred to.

"Q. Was Canadian River Gas Company a party to it?

"A. Canadian River Gas Company was not in existence at that time. The agreement provided for the subsequent organization by Southwestern."

"Q. When was Canadian River organized?"

"A. February 1928."

(R., V. 1, 455.)

Spencer further stated that Canadian at the first meeting

of its Board of Directors held on March 27, 1928, adopted a resolution authorizing the purchase of Amarillo's gas leaseholds, rights and wells and that

"* * * The consideration to be paid by Canadian River to Amarillo Oil Company for such gas rights and properties had been previously negotiated and fixed by representatives of Southwestern, Standard and Cities Service in the Memorandum of Stipulations dated April 5, 1927. * * *" (R., V. 1, 405.)

He further testified as follows:

"Q. And at the time when the transaction that you referred to, namely the meeting of the Board of the Canadian River and the adoption of the resolution authorizing the payment of five million dollars for the acreage, when that took place were there any negotiations between Canadian River and the Amarillo Oil Company concerning that?

"A. None whatsoever. That was merely a part of the carrying out of the terms and conditions of the April 5, 1927 agreement."

(R., V. 1, 455-456.)

There was no affiliation of any character whatsoever between Standard, Cities Service and Southwestern at that time. Southwestern represented Amarillo in the negotiations by reason of the fact that it owned all of the common stock of Amarillo. In addition to Moody and Fitzpatrick, Southwestern was represented also by A. R. Jones, of Kansas City, who was President of Mission Oil Company, which owned approximately 49% of the common stock of Southwestern. Jones always appeared in the conferences when a proposition was being seriously considered. (R., V. 1, 519, 521.)

It is apparent from the above that in the negotiations referred to Standard for itself and Cities Service occupied the position of purchaser and Southwestern acting for Amarillo occupied the position of seller, and that the purchaser attempted to acquire the properties for the Project as cheaply as possible and the seller attempted to get as much as pos-

sible for them. It is evident, therefore, that every element of arm's length bargaining between non-affiliated parties was present and operating in the negotiations, as well as in the consummation of the transaction.

It is true that after the negotiations were finally terminated and the consideration and other terms agreed upon, the properties were actually transferred by Amarillo to Canadian. The Commission has seized upon this fact as the basis for its finding that the purchase and sale constituted a transaction between two wholly owned and affiliated subsidiaries of Southwestern. The Record clearly refutes this contention. The original negotiations and agreement could not possibly have been had between Amarillo and Canadian for the very simple reason that Canadian was not then in existence and was only created by Southwestern for the purpose of carrying out the terms and provisions of the Memorandum of Stipulations (Exhibit 1) dated April 5, 1927. Moreover, as hereinafter shown, Canadian is only a nominal subsidiary of Southwestern.

2. *The affiliation between Amarillo and Canadian is only nominal and does not exist in fact or in practice, and, in any event, did not arise until after the contract to buy and sell the properties in question was consummated and the entire consideration paid.*

The contract between the Project organizers for the purchase of the wells and leaseholds of Amarillo was executed on April 5, 1927. Canadian was not organized until February, 1928. (R., V. 1, 455.) Such contract provided that Southwestern should organize Canadian and maintain it *separate from its other companies and projects* for the purpose of acquiring, maintaining and operating such properties for the benefit of the Project. (R., V. 1, 381, 382, 518-521.) Canadian was subsequently organized by Southwestern pursuant to the contractual provisions above referred to. (R., V. 1, 405.) The contract of April 5, 1927, provided that Canadian would enter into, for the consideration therein expressed, a long term contract (known as the "Cost Contract") to sell gas to Colorado Interstate on a cost basis. (R., V. 1, 392.)[*]

[*] See Statement, pp. 11 to 13, supra, for a description of the Cost Contract.

Although the issued and outstanding capital stocks of both Amarillo and Canadian were eventually owned by the same company, i.e., Southwestern, the affiliation in the ordinary sense ended there. Through its Cost Contract with Colorado Interstate, which was provided for in the organization agreement of April 5, 1927, Canadian, its properties and its operations became so involved in contractual obligations to Colorado Interstate that during the term thereof it could not possibly function as a subsidiary of Southwestern in the ordinary or usual sense of the word. It could not declare and pay dividends to Southwestern because it could not have profits upon which to declare such dividends. It could not buy or sell property without the consent of Colorado Interstate. It could not borrow money or incur obligations without the consent of Colorado Interstate. It was for these reasons that the agreement of April 5, 1927, provided that Canadian should be organized and maintained by Southwestern separate and apart from its other subsidiaries. (R., V. 1, 361-382.) Southwestern does not, and could not realistically, include Canadian as a subsidiary in its consolidated financial statements.

As will be shown in the next subheading, the entire consideration of $5,000,000 had been paid to and received by Amarillo prior to the incorporation of Canadian. (R., V. 1, 455.)

It is apparent from the above that any affiliation between Amarillo and Canadian is purely nominal and did not arise, in any event, until after Canadian was created in February of 1928, long after the organization agreement of April 5, 1927, had been made and the $5,000,000 transaction had become fully effective, except for the formality of transfer.

"The transaction in question was not a mere matter of inter-company book entries with no cash changing hands, as is ordinarily the case in a 'write-up.'"

$5,000,000 in cash was actually paid by Canadian for its properties, which sum represented outside funds advanced by outside non-affiliated interests (Standard) for that specific purpose. We quote from the testimony of Spencer with respect to the payment of $5,000,000, as follows:

"Q. So that the cash started from Standard Oil Company then to the Colorado Interstate and then to Canadian River?

"A. That is right from a cash standpoint. * * *

"Q. So Southwestern Development Company was not taking five million dollars of its own funds and paying it to its own subsidiary?

"A. It got five million dollars of outside money."

(R., V. 1, 459.)

The Commission has found that Canadian actually paid Amarillo $5,000,000 in cash for the latter's gas leaseholds and wells in the Texas Panhandle Field. (R., V. 1, 150.)

Luttring, Commission witness, also testified that the payment of the $5,000,000 was contingent only upon two principal conditions, namely, the obtaining of a natural gas franchise in Denver and approval of the title to properties of Amarillo which it was intended would be conveyed, and that after those two conditions had been satisfied, the $5,000,000 would be paid. (R., V. 5, 2914-2915.) Luttring further testified:

"Q. * * *

"Ultimately the Amarillo Oil Company received by way of credits or otherwise the full amount of the purchase price of five million dollars?

"A. Yes."

(R., V. 5, 2938.)

It is perfectly apparent from the above that there was no element of a "write-up" in this transaction as suggested by the Commission. There could have been no "write-up" for the very simple reason that $5,000,000 was actually paid and the funds, for this purpose, were advanced for Canadian by Standard, which company had no interest whatsoever in Southwestern or any of its subsidiaries. Subsequently, Canadian repaid the advances out of its own funds. The money, therefore, came from sources entirely outside of the Southwestern holding company system.

The $5,000,000 was permanently and irretrievably paid to Amarillo as the purchase price for its gas leaseholds, rights and wells. There was no eventuality, inter-company or otherwise, which could have compelled Amarillo to return such purchase price, or any part thereof, to Canadian. Thus, we have here not only the form but the substance of a real transaction between two parties, and not merely the form which accompanies a write-up transaction.

In its answer brief to our original petition for certiorari, the Commission points out that the alleged profit made by Amarillo was carried on Canadian's books in a so-called "appreciation account" until 1939, and that no income taxes were paid on such profit by Amarillo. This has no significance whatsoever. At the time of this transaction, Southwestern had elected to file Federal income tax returns for itself and its subsidiaries on a consolidated basis. Once Southwestern had determined to file consolidated income tax returns for itself and its subsidiaries, it had no choice but to include Canadian in such consolidated income tax return after its incorporation. Consequently, any profit realized by Amarillo in the transaction was eliminated for income tax purposes in the consolidated return. (R., V. 5, 2638.) At the same time, however, it should be noted that such elimination of taxable profit resulted in a lower depreciation and depletion base for Canadian's and the consolidated group's future use for tax purposes which in the long run may well require the payment of more, rather than less, Federal income taxes. This is the whole story concerning this phase of the transaction.

Certainly, this method of handling the transaction in order to comply with income tax laws does not in any manner change the arm's length nature of the transaction as reflected by the uncontradicted evidence, or the fact that Canadian in good faith paid $5,000,000 in cash for the property and that the property was worth more than the price paid for it. As stated in the A. T. & T. and New York Telephone cases hereinafter referred to, these are the facts that really count.

Neither the transaction nor the so-called "appreciation account" resulted in any entry whatsoever in Canadian's

surplus account. (R., V. 5, 2637.) From an accounting standpoint there could have been no write-up unless it was reflected in Canadian's surplus account. Canadian had received no gifts and it was not resorting to inflation of its assets, synthetic or otherwise, because it had in fact paid $5,000,000 in cash for these properties. Consequently, it had nothing to record in its surplus account. It is apparent that no matter how Canadian may have kept its books of account for tax or other purposes, and notwithstanding any evidence of the true arm's-length character of the transaction, and of the true value of the property, the position of the Commission and its staff would have remained the same, simply because it was a transaction, so they say, between affiliated companies.

4. The Record does not contain even an intimation that Canadian paid an excessive or imprudent price for its properties acquired from Amarillo. On the other hand, the Record amply demonstrates that the property acquired was and is worth substantially more than the amount paid.

Payne testified with respect to the reasonableness of the consideration paid as follows:

"Q. * * * Now, at the time you made this final agreement of $5,000,000.00 * * *, was it your judgment then that that was a prudent business agreement to make on behalf of the business interests you represented (Standard)?

"A. I was satisfied it was a very good business deal * * *, yes.

"Q. And on the basis of the facts as they were then, is it still your judgment that that was a prudent business deal and that the leases and wells were worth what was paid for them?

* * * * *

"The Witness: That is still my judgment."

(R., V. 1, 525-526.)

Wallace testified that the leaseholds acquired, exclusive of all well costs, plus a small acreage of additional leaseholds, had a value at the time of the hearing of $15,646,787.64. (R., V. 6, 3181-3254.)

5. Prior to acquisition by Canadian, the properties in question had not been devoted to a public use or to the transportation or sale of natural gas in interstate commerce.

The Commission makes no contention or finding that Amarillo had ever devoted its properties to the public service prior to the acquisition thereof by Canadian. The Commission does intimate, however, that the properties acquired by Canadian from Master Oil and Gas Company and the properties acquired by Amarillo from Mission Oil Company had theretofore been devoted to the public service. (R., V. 1, 150.) This offhand statement, however, is not supported by the Record. Master Oil and Gas Company had never sold any gas for any purpose from its properties prior to the acquisition thereof by Canadian (R., V. 5, 2801, 2802) and the Record is entirely silent with respect to any sales by Mission Oil Company. Furthermore, the properties sold by Master Oil and Gas Company were in no sense involved in the purchase of Amarillo's gas leaseholds, rights and wells by Canadian.

The Record clearly shows that Amarillo had never devoted its properties to the public service. Its first sales of gas were made in October, 1920, to Panhandle Pipe Line Company, which was not then affiliated in any manner with Amarillo. (R., V. 5, 2861, 2927.) This gas was sold and delivered at the wellhead in the field, (R., V. 5, 2927-2928) and was ultimately consumed in Texas. It was produced from three wells, being Masterson Nos. 1, 2 and 4. (R., V. 5, 2862, 2866.) Obviously, these sales were not subject to regulation by the Commission for the very simple reason that (1) they were sales in intrastate commerce, (2) the Natural Gas Act authorizing regulation of the transportation and sale of gas in interstate commerce was not enacted until 1938 and (3) such sales, in any event, are not subject to regulation under the Act. Neither were such sales subject to regulation in the State of Texas. *Humble Oil & Refining Co. v. Railroad Commission of Texas*, 128 S.W. (2d) 9.

Commencing in 1923, Amarillo also sold gas to a zinc smelter located near the City of Amarillo, Texas. (R., V. 5, 2928.) This was an industrial sale and, therefore, no public interest or regulation attached. (R., V. 5, 2929.)

Amarillo acquired from Mountain States Gas Company in excess of 250,000 acres of leaseholds as of August 1, 1924. (R., V. 5, 3051, 3069.) There were no revenues from such properties by reason of gas sales or otherwise until after August 1, 1924. (R., V. 5, 3048.) Obviously, such properties could not have been devoted to a public service prior to August, 1924; nor thereafter, by virtue of the sales of gas by Amarillo at the wellhead produced from three wells *located on other property*. Finally, all of the leasehold properties and wells of Amarillo could not be said by any stretch of the imagination to have been devoted to a public service by virtue of local sales from three wells. Moreover, the properties involved in this case could not be said to have been devoted to a public service prior to 1938, in so far as the issues here involved are concerned, because Congress did not enact the Natural Gas Act until 1938. Prior to that date Congress had expressly excluded from regulation the transportation and sale of natural gas in interstate commerce. (34 Stat. 584; Title 49, U.S.C.A., Sec. 1 (1) (b).)

* * * * * *

There is absolutely no basis in the Record for the deduction of $121,787 from Canadian's original cost on the theory that this sum represented a profit made by Master Oil and Gas Company in the sale of its properties to Canadian. As shown by the Statement, this transaction resulted from arm's length negotiations. No gas had ever been sold from the properties prior to the acquisition thereof by Canadian. (R., V. 5, 2801-2802.)

The Commission also erroneously deducted $128,534 from Canadian's original cost, being the alleged profit made by Mission Oil Company in the sale of properties to Amarillo. The Record clearly demonstrates there was no basis for this action. Furthermore, this transaction involved production properties that were included in the sale by Amarillo to Canadian, and if the full $5,000,000 purchase price is allowed for such properties, it necessarily follows that such deduction was erroneous.

It is, of course, perfectly obvious that the Commission was in error in deducting approximately $245,000 for interest during construction on the alleged profit made by

Amarillo on the sale of its gas leaseholds, rights and wells to Canadian. This deduction was made on the theory (which is not supported by the Record) that such alleged profit was a write-up. (Com. Op., R., V. 1, 151.)

The refusal of the Commission to allow Canadian its actual cash investment in gas leaseholds, rights and wells for rate base purposes, and its application of original cost theories to production properties in this instance results in relegating Canadian to the provable cost of its predecessor companies and denies Canadian any return on $3,615,670.26 of its actual cash investment in such properties, including interest during construction, as well as the right to recover such sum through the sale of its gas.

We most earnestly contend that the undisputed facts in this case demonstrate clearly and conclusively that the Commission erred as a matter of law in holding that the transaction whereby Canadian acquired the gas leaseholds, rights and wells of Amarillo constituted a transaction between affiliated companies and that the alleged profits, therefore, constituted "affiliated company profits." The Circuit Court was also in error in holding that such alleged profits of Amarillo constituted a "synthetic inflation." The opinions of both the Commission and the Circuit Court clearly show that their conclusions were based upon the assumption that the transaction in question represented nothing more than an arrangement between two wholly owned subsidiaries of Southwestern. The Record clearly refutes this assumption and shows that the real transaction was between non-affiliated parties and that the purchase price was agreed upon only after prolonged arm's length bargaining between non-affiliated parties.

This Court has held on many occasions that a finding without evidence is beyond the power of a court or commission and likewise that a finding made upon evidence which clearly does not support it is an arbitrary act against which courts afford relief. We submit that under all of the circumstances the statement of the Commission with respect to "affiliated company profits" and the statement of the Circuit Court that such alleged profits constituted a "synthetic inflation" are arbitrary and being such cannot stand. This

principle was clearly stated by this Court in the case of *Northern Pacific Railway Co. v. Department of Public Works of Washington*, 268 U.S. 39, 44-45. Mr. Justice Brandeis, speaking for the Court, said:

> "* * * where rates found by a regulatory body to be compensatory are attacked as being confiscatory, courts may inquire into the method by which its conclusion was reached. An order based upon a finding made without evidence * * *, or upon *a finding made upon evidence which clearly does not support it* * * * is an arbitrary act against which courts afford relief. * * *." (Italics supplied.)

See also the following additional opinions by this Court:

Interstate Commerce Commission v. Union Pacific Railroad Co., 222 U.S. 541, 547;
United States v. Baltimore & Ohio, Southwestern Railroad Co., 226 U.S. 14, 20;
Interstate Commerce Commission v. Louisville & Nashville Railroad Co., 227 U.S. 88, 91;
Florida East Coast Railway Co. v. United States, 234 U.S. 167, 185;
United States v. Abilene & Southern Railway Co., 265 U.S. 274, 288.

The Circuit Court, in characterizing the difference between the purchase price actually paid by Canadian and the alleged provable original cost of Amarillo and its predecessors in title as a "synthetic inflation," held in effect that the same was properly eliminated by virtue of *Pennsylvania Power & Light Co. v. Federal Power Commission*, 139 Fed. (2d) 445 (certiorari denied). This case has absolutely no relevancy to the facts in the case at bar. It involved merely the proper method of keeping accounts by licensees under the Federal Water Power Act, which Act prescribes the manner in which such accounts should be kept. There is no such provision in the Natural Gas Act. In addition to this, however, the Pennsylvania case involved a claim for construction profits by one company against another company, both of which were puppets of the same holding company system. In fact, both parties were merely departments of one common holding company system. This does not even remotely ap-

proach the situation with respect to Amarillo. Amarillo acquired and developed the properties in question almost ten years prior to the time they were sold to Canadian for the Denver Project and in the interim it had increased the value thereof very materially as the result of discovery and exploration.

The Pennsylvania case would be more nearly applicable to the facts here if Amarillo had been employed by Canadian to go out and assemble the leaseholds in question after the Denver Project had been inaugurated and then Canadian had paid Amarillo a profit for the work performed by it. It is too clear for argument that this is not the situation confronting this Court, yet that was the very situation involved in the Pennsylvania case. In this case Amarillo acquired the leaseholds before there was any affiliation whatsoever, nominal or otherwise, with Canadian and in some instances before there was any affiliation with Southwestern. Properties originally acquired by Amarillo in 1917 were located more than 200 miles from any known oil or gas deposits. The leaseholds at the time of acquisition had little or no value and, consequently, only a nominal sum was paid therefor. Amarillo held these leaseholds for a period of approximately ten years with a very meager return. In the meantime it had developed them into properties of great value as the result of extremely hazardous "wildcat" exploratory operations. The circumstances, therefore, do not even remotely approach a situation where one department of the same parent holding company performs construction work for another and claims a profit as a result thereof. The Pennsylvania case would not be applicable here, in any event, because of the arm's length negotiations. Likewise, the various other cases cited by the Commission on this point in its answer brief to our petition for certiorari involved, for the most part, questions of accounting by licensees under the Federal Water Power Act and profits for construction work performed in reality by one department of a holding company system for another. Obviously, such cases have absolutely no relevancy to the facts in the case now before this Court.

Even if the transaction whereby Canadian acquired gas leaseholds, rights and wells from Amarillo was solely one

between affiliated companies, and even if the properties acquired had been theretofore devoted to a public service, still the profit made by Amarillo could not be condemned and eliminated on such grounds alone. This very question has been recently decided by this Court in the case of *A. T. & T. Co., et al., v. United States, et al.*, 299 U.S. 232, 240, 81 L. Ed. 142. In that case Mr. Justice Cardozo speaking for a unanimous Court held definitely and positively that where properties were purchased from an affiliated company, or from a company that prior to the purchase had devoted such properties to a public use, any profit made by the selling company could not be written off or ignored if, as a matter of fact, "*the difference between original and present cost is a true increment of value.*" (Italics supplied.)

This principle has been reaffirmed in the recent case of *New York Telephone Co. v. United States, et al.*, decided August 24, 1944, by a three Judge court for the Southern District of New York, Advance Opinions, Federal Supplement, Volume 56, No. 7, Page 932. There was involved in that case the purchase of equipment by the New York Telephone Company from its parents, the A. T. & T. Company. The latter company owned all of the common stock of the former. The cost of such equipment on the books of the A. T. & T. Company, after depreciation, aggregated $8,468,169.81, whereas the purchase price paid by the New York Telephone Company was $12,634,680.38, or an excess over A. T. & T. Company's net book cost amounting to $4,166,510.57. The Federal Communications Commission ordered the New York Telephone Company to write down the actual cost of the property in question to the net book cost of the selling company. *The Court held that the purchasing company could not be required to write down the actual cost of the property if, as a matter of fact, it was worth the sum paid,* citing the A. T. & T. decision by this Court referred to above.

While these cases involved questions of accounting, the underlying principle is even more applicable here. It is important to a regulated company that its books of account reflect actual consideration paid for properties where the true value of such properties is in keeping with the consideration paid, but it is fatal to a regulated company if it is

unable to have actual consideration paid for properties reflected in its rate base where the true value of such properties is in keeping with the consideration paid.

Certainly, on the basis of the above principle, there is no ground for eliminating more than $3,000,000 from the purchase price paid by Canadian to Amarillo for gas leaseholds, rights and wells in 1928. As heretofore stated, the entire $5,000,000 was actually paid in cash and in good faith after prolonged negotiations between adverse parties. The Record reflects clearly that the property was worth even more than the amount actually paid by Canadian and, therefore, in the language of Mr. Justice Cardozo "the difference between original and present cost is a true increment of value."

Commission counsel also rely on the case of *Niagara Falls Power Co. v. Federal Power Commission*, 137 Fed. 787, 793-794 (certiorari denied). That case involved the determination of the value of properties conveyed by the owners thereof to a common company for which each of said owners accepted common stock in the same proportion that the value of the properties conveyed by each bore to the total value. In other words, this transaction constituted simply a pooling of assets into one common operating company. No money whatsoever passed from the purchaser to the seller. It was a merging or consolidation of assets and in the end each of the so-called sellers owned a portion of the combined assets. This was not true with respect to the sale by Amarillo to Canadian. This sale did not constitute in any sense a pooling of assets as suggested by Commission counsel. The sale by Amarillo and the purchase by Canadian was a condition precedent to the establishment of the Denver Project. *The money paid belonged to Amarillo definitely and exclusively and no contingency whatsoever could arise in the future which would affect its right to keep and retain the full purchase price paid.* The project might have failed completely, but even so, Amarillo would not have been affected, and neither would its parent, Southwestern, in so far as the $5,000,000 payment is concerned.

Any pooling in this case could not have occurred until after provision had been made for the acquisition of the gas leaseholds, rights and wells in question, including payment

to Amarillo of the full $5,000,000 purchase price in cash. This sum belonged absolutely to Amarillo without regard to the future operations or fortunes of the Denver Project. The Niagara Falls case, therefore, and the principle decided therein, can have no relevancy whatsoever to this case.

This Court has said in the Natural Gas Pipeline and Hope cases that the Commission is not restricted to any particular formula, or combination of formulas, in arriving at a rate base. Notwithstanding such latitude, however, these opinions clearly require that any formula, or combination of formulas, applied by the Commission shall bear some reasonable relationship to the admitted facts in any given case. This is clearly demonstrated in the concurring opinion by Justices Black, Murphy and Douglas in the Natural Gas Pipeline case wherein it is stated: "The Commission has a broad area of discretion for selection of an appropriate rate base. * * * Various routes to that end may be worked out by the expert administrators charged with the duty of regulation. * * * *The decision in each case must turn on considerations of justness and fairness which cannot be cast into a legalistic formula.*" (pp. 606-607) (Italics supplied.)

The formula, legalistic or otherwise, applied by the Commission in this case results in the inclusion of Canadian's leaseholds in its rate base at a zero valuation for some of Canadian's most valuable leaseholds and at value of only 10¢ per acre to a still greater block of important leaseholds, and at nominal value of not to exceed $1.00 per acre on the great majority of such leaseholds. The undisputed testimony proves that the leaseholds involved in this case were worth many millions of dollars, exclusive of the wells. Clearly, the formula applied by the Commission here does not meet any test of "justness and fairness."

The Commission in this case has restricted Canadian for rate base purposes to the provable costs of the owners of its leaseholds who first engaged in an extremely hazardous "wildcat" enterprise in search of oil and gas over 25 years ago. They naturally paid little for their "wildcat" acreage at the outset because such acreage had little or no value at the time of its original acquisition—in fact, it might have

been a liability because it had drilling obligations attached to it. The value was developed by exploratory operations and discovery, which preceded by almost ten years the purchase of such leaseholds by Canadian, and which preceded by twenty years the enactment of the Act, which for the first time subjected to regulation the transportation and sale of natural gas in interstate commerce for resale for public consumption. Certainly, the public interest does not require that the consumers of natural gas produced from such properties be given the entire economic benefit resulting from the extremely hazardous undertaking involved in the discovery and subsequent production of natural gas under such circumstances. Certainly, no one will engage in the business of drilling a "wildcat" well 200 miles from any known oil or gas production, as Amarillo did, if the return upon such undertaking is to be limited literally to 6½% on the cost of the hole in the ground. We submit that neither the public interest nor the Act requires and the Fifth Amendment prohibits a rate regulatory process based upon any such theory.

The Commission has applied its prudent investment theories blindly in this case. It has not taken into account the undisputed facts and the realities developed in the Record. It has not attempted to base its conclusions "*on considerations of justness and fairness*". Mr. Justice Brandeis in his celebrated opinions defined "original cost" or "prudent investment" as the amount actually paid to establish the utility. *State of Missouri ex Rel. Southwestern Bell Telephone Co. v. Public Service Commission*, 262 U. S. 276. He developed there the theory that dollars were dedicated to the public service and not necessarily the property itself. This theory is based upon the assumption that the dollars actually invested at the time constitute the best evidence of value. This could not possibly be true in a mining operation such as this one where cost frequently has little relationship to value. The principle cannot apply also because the money invested by Amarillo and its predecessors in title in "wildcat" leaseholds was not invested in any sense of the word in a public service enterprise. The investment was made in a mining enterprise and at a time and under such circumstances that it could not be known whether the

property in question would ever produce natural gas. The great increase in value occurred by reason of the discovery of large deposits of natural gas. This necessarily preceded any sale of gas in interstate commerce or otherwise. Therefore, Amarillo and its predecessors in title did not in the first instance invest money in a public service enterprise of any character whatsoever. It is true that when Canadian acquired the properties from Amarillo that it did so for the purpose of producing natural gas, a portion of which would be ultimately transported and sold in interstate commerce. This was the first time, in any event, that any money was invested in or dedicated to a project that might be said to constitute a public service project. The money paid to Amarillo by Canadian, therefore, represents the very minimum prudent investment or original cost figure that can be applied in accordance with the principles announced by Justice Brandeis. In other words, the entire sum of $5,000,000 paid by Canadian to Amarillo for the latter's gas leaseholds, rights and wells must be recognized as a prudent investment if the undisputed facts in this Record are recognized. The Court will bear in mind that even when this investment was made the transportation and sale of gas in interstate commerce was not affected with a public interest and did not become so until the Act was passed in 1938.

We earnestly contend that the undisputed facts in this case demonstrate that the transaction whereby Canadian acquired the leaseholds, rights and wells of Amarillo was one between non-affiliated companies and that every safeguard necessary to insure a fair price and to render the transaction arm's length was present and operating here. There is nothing in the Record to indicate that the price paid was excessive or imprudent and, as a matter of fact, the uncontradicted evidence would justify a much higher consideration than that actually paid. There can be no question but that the properties were not devoted to the public service prior to the time that the sale was made. Amarillo's only sales prior thereto were at the wellhead and to an industrialist consumer, neither of which is affected with a public interest. Furthermore, the subsequent sales made by Canadian in interstate commerce for resale were not af-

fected with a public interest until the passage of the Act in 1938, almost twenty years after most of the property was acquired by Amarillo and its predecessors in title and more than ten years after the purchase of the same by Canadian. It is further contended that, in any event, the undisputed facts and circumstances in this case demonstrate clearly that the prudent investment theory as developed, construed and applied by the Commission in this case produces such absurd and unrealistic results that it cannot be applied here for the purpose of determining the rate base of Canadian with respect to the leaseholds as such. If such theory is to be applied at all, it cannot be applied to the "wildcat" cost of such leaseholds incurred by Amarillo and its predecessors in title. The very minimum prudent investment cost under any such theory must be the actual cash paid therefor by Canadian in 1928.

It is, therefore, clear that the Commission should have included in its rate base not only the full amount of the $5,000,000 paid by Canadian to Amarillo for the latter's gas leaseholds, rights and wells, but also the full amount paid by Canadian to Master Oil and Gas Company for its properties and the full amount of interest paid by Canadian on the actual cash invested in properties prior to the termination of the construction period. If the full amount of Canadian's $5,000,000 purchase price is allowed, it follows that any alleged profit made by Mission Oil Company in the sale of its properties to Amarillo becomes entirely moot and is eliminated as an issue in this case.

Question 8.

Allocation.

k. Failure of the Commission to Make Any Property Separation.

Where property is used in public service, it is universally acknowledged that the owner must be paid for that use. Where the owner uses such property only part time, or uses only a part of the whole property in such service, he is only entitled to be paid to the extent of that use. Where he devotes the same property during a part of the time or a part of the whole property to some purely private ven-

ture, he can demand for such use in such private venture simultaneously carried on whatever compensation may be agreed upon between him and the other parties in interest. This being the case, it would seem to follow from a simple application of common sense and without any elaborate argument and without any citation of authority that a separation of the property, based upon use, must be made in order to determine the payment that is due for such use in the public service. This proposition is so not only as a matter of plain common sense, but it exists in this case as a matter of law. It was incumbent upon the Commission as an administrative body in order not to transcend its jurisdiction to draw and observe two jurisdictional boundaries: First, the boundary line between interstate and intrastate commerce; and, second, the boundary line between sales for resale and direct sales not subject to regulation under the Act. The Commission is circumscribed by each of these boundaries.

The necessity of such a property separation is not only dictated by logical reasoning, but is required by the express mandate of this Court in its several previous decisions, including, among others, *Smith v. Illinois Bell Telephone Co.*, 282 U. S. 133, 146, 75 L. Ed. 255, 262, and the *Minnesota Rate Cases*, 230 U. S. 352, 435, 57 L. Ed. 1511, 1536.

This general proposition is presented at length in the Brief of Colorado Interstate in Case No. 379 and in order to avoid unnecessary duplication we shall not further elaborate herein our general argument on this point, but hereby adopt Colorado Interstate's Brief with respect thereto.

The Commission in this case has expressly ruled that a separation of property is not required. (R., V. I, 175.) In lieu of such separation, however, the Commission has invented and applied a substitute "allocation of cost of service" formula or theory, treating Canadian and Colorado Interstate as if they were one company instead of two separate companies, and treating their properties as a unit notwithstanding the fact that the Commission has entered separate and individual rate reduction orders against each of said companies.

In the following subdivisions of the argument on this question we shall point out certain specific reasons why the Commission's allocation of cost of service theory is inherently fallacious and in any event, whether sound as an abstract theory, has been misapplied in this case to the grievous prejudice of Canadian. In connection with this subdivision, however, directed particularly to the necessity of a property segregation, we call attention to the following fallacies in the Commission's cost allocation theory which in themselves show the necessity of a property segregation in order for the Commission to keep within its jurisdictional limitations.

1. In the first place, as established by the uncontradicted evidence, there is a commodity market value for Canadian's gas at the wellhead and at the end of the gathering operations which has been entirely ignored by the Commission. Admittedly, only a part of Canadian's gas sales are subject to the Commission's jurisdiction. Certainly Canadian has the right to receive the fair market value of its gas as a commodity for that portion of its business which is not subject to the Commission's jurisdiction. When the Commission ignores the commodity value of all of Canadian's gas, both jurisdictional and non-jurisdictional, and makes its so-called allocation of costs directed to all the gas, it inevitably must follow that the Commission is exercising a rate regulatory jurisdiction over the non-regulable gas. This could all be avoided if a property separation had been made.

2. As we have pointed out under "Question 1", the Commission, notwithstanding the prohibitory and limiting provisions of the Act and the ruling of this Court, has, with the Circuit Court's sanction, exercised rate regulatory jurisdiction over Canadian's production and gathering properties, facilities and business. The Commission in exercising such jurisdiction has computed a rate base for Canadian's total properties. In that rate base it has included all of Canadian's production and gathering properties on its own theories of original cost and prudent investment, which are only a fraction of their proven fair market value and of Canadian's actual cost. Admittedly, only a

portion of these production and gathering properties is devoted to the production and gathering of gas which is sold and transported in interstate commerce for resale for ultimate public consumption subject to the Commission's jurisdiction. In arriving at its allocated costs and excess of revenue over costs, the Commission has applied a 6½% rate of return to the entire properties although those properties are only used in part for regulable gas. In determining excess revenue over costs it is clearly improper for the Commission to limit Canadian to a 6½% return on the value, however determined, of its non-regulable properties. This particular question is also presented at length in the Brief of Colorado Interstate, which argument is also hereby adopted.

3. As pointed out in the Statement of the Case, Canadian sells gas to Colorado Interstate under a Cost Contract dated January 3, 1928. (Exhibit 16, R., V. 2, 711-780.) Again in its application of its cost allocation formula, the Commission has made no segregation of the properties involved in this Cost Contract as between the regulable and non-regulable gas covered thereby, but has made a blanket reduction order of $551,000 annually in the aggregate amount of cost reimbursement which Canadian is entitled to receive under the Contract, notwithstanding the fact that a part of such compensation which Canadian is entitled to receive is for non-regulable gas and is for the performance of obligations over which the Commission has no rate regulatory jurisdiction whatsoever. In thus abrogating the compensation provisions of the Cost Contract as a whole the Commission has interfered not only with the price which Canadian is entitled to receive from Colorado Interstate for regulable gas, but also the price which it is entitled to receive for non-regulable gas over which the Commission has no jurisdiction. This again could all be avoided by a proper separation or segregation of properties, revenues and expenses as between those devoted to regulable gas business and those devoted to non-regulable gas business.

2. *The Fallacies of the Commission's So-Called "Allocation of Costs of Service" as a Substitute for a Proper Separation of the Property and Expenses.*

In view of the decisions of this Court holding that a separation of properties must be made for the purpose of properly determining costs applicable to regulated business as distinguished from unregulated business, it is our contention that the Commission's so-called "allocation of cost of service" cannot be accepted in principle or otherwise because, as the Commission has admitted, it made no such separation of properties. If we should assume, *arguendo*, however, that the Commission's substitute method, when properly applied, accomplishes the same thing (which it does not), it is our further contention that the application by the Commission of its method in this case is so completely at variance with the facts and realities that the results obtained can form no useful purpose whatsoever and must be completely rejected. Some of the errors in the Commission's method are easily demonstrated because they arise from a total disregard of material facts. Other errors are not so easily displayed for the reason that the Commission has failed to make appropriate findings to support its conclusions. As is pointed out in the Brief of Colorado Interstate in Case No. 379, which is hereby adopted on this point, this failure to make appropriate findings in itself constitutes reversible error. *U. S. v. Carolina Freight Carriers Corporation*, 315 U. S. 475, 488-489, 86 L. Ed. 971; *Interstate Commerce Commission, et al., v. Columbus and Greenville Railway Company*, 319 U. S. 551, 87 L. Ed. 1580.

The Commission found that $1,778,000 represented Canadian's total cost of service (including the Commission's uniform rate of return allowed on its total properties) and that $615,000 represented Canadian's total or over-all "Excess Revenue Over Costs". (R., V. 1, 176.) These *total* findings were based upon the Commission's consideration of Canadian's separate and individual properties, revenues and expenses. In breaking down and allocating this *total* cost of service and this total or over-all "Excess Revenue Over Costs" between regulable business and customers and non-regulable business and customers of Canadian, how-

ever, the Commission did not do so on the basis of Canadian's separate and individual properties, revenues, volume of sales and expenses, but combined all such sales with similar items of Colorado Interstate. The total "Excess Revenue Over Costs" represents, therefore, neither the costs of Canadian nor the costs of Colorado Interstate, but a conglomerate of the two. (R., V. 4, 2317, 2381.) The rate reduction order was then entered against Canadian separately and individually and not against the composite pipe line system. (R., V. 1, 176, 185-188.)

No attempt was made to allocate excess earnings, if any, between Canadian's regulable and non-regulable business based solely upon its own properties, revenues, volume of sales and expenses. This approach by the Commission resulted in saddling Canadian with expenses of Colorado Interstate which Canadian never incurred and burdening Canadian's non-regulable business with costs and expenses which are not properly chargeable to such business, as will be more specifically hereinafter shown.

Wellhead Costs.

The Commission has approved and adopted the allocation method of the Commission staff (R., V. 1, 176), presented by Commission witness Lyon, which is demonstrated in his Exhibit 226. (R., V. 4, 2317-2337, 2381-2384.) In the determination of the cost of gas at the wellhead, Lyon, in his Exhibit 226, took into account many so-called elements of cost that were not incurred, and by the very nature of things could not have been incurred, by Canadian in the actual production of natural gas. It is apparent that be allocated or assigned to Canadian's cost of producing gas a substantial amount of the operating expenses of Colorado Interstate, which expenses could have absolutely no materiality in so far as the determination of Canadian's cost of production is concerned. One example should suffice to show the gravity of the errors committed in this respect. In allocating the combined Federal income taxes of both Canadian and Colorado Interstate, Lyon allocated $113,287.28 of such taxes to Canadian's cost of producing gas. (R., V. 4, 2327, Lines 13 to 17.)

In making a separate determination of allowable expenses

for Canadian, however, the Commission found that in the test year of 1939 Canadian paid only $66,403 for Federal income taxes on its entire operations. (R., V. 1, 167.) Obviously, the total amount of income taxes involved in the cost of producing gas would be less than the total amount paid, but, strange as it may seem, Lyon has allocated to Canadian's producing operations income taxes in excess of $113,000, almost $50,000 more than was actually paid by Canadian for its entire operations. Certainly, it takes no argument to demonstrate the error in this respect.

Canadian sells large volumes of gas at the wellhead to Amarillo Oil Company. (R., V. 4, 2319, Lines 56 to 58), which gas is purchased and consumed wholly within the State of Texas (R., V. 2, 708; see, also, Appendix B) and is not subject to regulation by the Commission. Lyon's erroneous computation has the effect of saddling costs amounting to several thousands of dollars upon the production of this gas which obviously were never incurred by Canadian. This erroneous shifting of costs to Canadian's non-regulable gas sales decreases the actual costs attributable to regulable gas sold for resale in interstate commerce. It follows, therefore, that the intrastate gas sales have been unfairly and unjustly burdened with a cost never incurred and, as a consequence, the regulable sales have not been assigned a fair share of the cost. It also follows that the rate reduction order is excessive by the amount of the excessive costs placed upon non-regulable intrastate gas.

Aside from the errors resulting from the use of a "composite" cost of service as applied to Canadian's non-regulable business, the method of allocation developed by Lyon and adopted and applied by the Commission is also erroneous because it does not take into account load factors and peak demands with respect to production operations and requirements. (R., V. 5, 2414-2415; V. 4, 2397.) Lyon made no distinction whatsoever in the cost of producing industrial gas, largely direct sale, and domestic gas, largely resale. He considered that it cost just as much to produce gas for one type of market as another.

The peak monthly demand of Colorado Interstate at Clayton Junction during the winter of 1939-1940 for resale gas,

which is largely for domestic and commercial uses, was 1,394,090 Mcf. (16.4-pressure base), while the demand for direct sale gas, which is for industrial uses, was 909,540 Mcf. (R., V. 8, 5045.) It follows, therefore, that the resale gas required a little over 50% more of the capacity of the wells during this peak month than did the direct sale industrial gas. The cost of providing the peak-month capacity for the resale gas, therefore, was 50% greater per Mcf. than for the direct sale gas. This being true, his failure to distinguish between the costs applicable to the two types of gas sales has the effect of burdening direct sale non-regulable gas with costs not incurred and to reduce by the same amount costs actually incurred in the production of gas sold for public consumption. Lyon recognized that the peak day demand increased the transmission cost for resale gas for public consumption. (R., V. 4, 2317, 2383.) This component of cost is just as applicable to gas wells as it is to transmission lines.

Gathering Costs.

Here again, many of the costs attributable only to the operations of Colorado Interstate were added to Canadian's gathering costs. For example, Federal income taxes in excess of $28,000 were included as a part of such costs. (R., V. 4, 2327.) This, added to the $113,000 included for Federal income taxes as a part of the cost of producing gas, aggregates in excess of $141,000 for income taxes alone, whereas $66,000 only were allowed by the Commission for all purposes. This erroneous inclusion of a cost which was never incurred by Canadian in the gathering of gas obviously placed an undue burden upon the intrastate sales of gas made from the pipe line in Texas to Amarillo for the Towns of Hartley, Dalhart and Texline.

As was true in the case of gas wells, no consideration was given to the peak demands made upon the gathering system. Lyon and the Commission merely *assumed* there was no difference in the cost of gathering direct sale gas and resale gas and as a result computed an *average* cost for gathering all gas. (R., V. 4, 2329) although this factor was given some consideration with respect to transmission costs. (R., V. 4, 2317, 2383.)

The peak monthly demands made upon the gathering system are discussed in the preceding subdivision dealing with wellhead costs. It is apparent from the figures there quoted that if a proper division of costs had been made, it would have resulted in placing more costs upon the resale gas, which is subject to regulation, and, of course, lesser costs upon direct sale gas. The Commission's action in this respect unduly burdened direct sale gas with costs that were not incurred.

Transmission Costs.

In determining the cost of service of Canadian for the intrastate sales of gas to Amarillo Oil Company that are ultimately consumed in Dalhart, Hartley and Texline, Texas, the Commission took into account not only all of the properties and operating expenses of Canadian, but also all of the properties and operating expenses of Colorado Interstate, and applied its formula or method of allocation to the combined properties and operating expenses of both companies, thus treating both companies as one composite system. (R., V. 4, 2381, 2317-2363; V. 5, 2425; see, also, Brief of Colorado Interstate.) Dalhart, Texas, for example, is located approximately 45 miles from the Bivins Compressor Station (the beginning point of the Denver line) and approximately 30 miles from the limits of the Texas Panhandle Field. (See Commission staff—O'Connor's—Flow Map, Appendix B, attached hereto.) The greater portion of all the gas sold off of Canadian's pipe line within the State of Texas is sold at and consumed in Dalhart. The Commission's method of allocation of costs developed by Lyon results in Dalhart being assigned approximately the same cost per Mcf. that is assigned to the gas sold by Colorado Interstate to Public Service Company of Colorado at Denver, which point is almost 400 miles from the beginning point of the pipe line. Stated in another way, if the City of Dalhart were located at the northern terminus of Colorado Interstate's pipe line at Denver, the cost of service developed for delivering gas to Dalhart would be identical with the cost of service developed for delivering gas at its actual location, 30 miles from the gas field. This is true because the cost of this gas was computed on the

theory that the two companies constituted one composite system (R., V. 4, 2381) and no consideration was given to the specific points of delivery from the pipeline. (R., V. 5, 2425.)

Certainly, there can be no justification for any theory in the Commission's action in this respect. The costs incurred by Colorado Interstate in transporting gas from Clayton Junction to Denver, a distance of approximately 300 miles, can have no possible bearing upon the costs incurred by Canadian in producing and gathering gas and transporting the same to Dalhart, Hartley and Texline in the State of Texas. *The value of Colorado Interstate's property for rate of return, depreciation or any other purpose and the amount of Colorado Interstate's operating expenses can have no possible relevancy to Canadian's operations wholly within the State of Texas with respect to gas which is not sold to Colorado Interstate and which is in no way handled or controlled by Colorado Interstate. The cost-loading results in Canadian's intrastate business being erroneously charged or allocated a part of Colorado Interstate's costs and so burdens the intrastate sales.*

Cost of Service to Colorado Interstate

The Commission has ordered a reduction of rates with respect to gas sold by Canadian to Colorado Interstate in the sum of $551,000 annually. (R., V. 1, 176.) There is absolutely no evidentiary basis in the Record for any reduction whatsoever as to this particular sale, as will be developed hereinafter.

It is clear from the Commission's Opinion that it has adopted the allocation methods and principles of Commission witnesses and has purported to base its rate reduction order thereon. (R., V. 1, 176.) Such allocation methods and principles are embodied in the testimony of Commission witness Lyon and his Exhibit 226. It will be recalled that for the purposes of allocation, Lyon in his Exhibit 226 combined the properties and businesses of Canadian and Colorado Interstate and treated them as a composite system which resulted in an elimination or washout of all transactions between the two companies. (R., V. 4, 2367-2387.)

Table 1 of Exhibit 226 (R., V. 4, 2317) contains a complete summary of the allocated cost of service as determined by Lyon for each customer of Colorado Interstate and also for each customer of Canadian, *except Colorado Interstate*. There may be some basis in this Exhibit for determining cost of service to Amarillo and other customers of Canadian, but there is nothing whatsoever in this Exhibit or in the Record for the purpose of determining cost of service for gas sold by Canadian to Colorado Interstate.

The Commission has cast aside all of Canadian's testimony on the subject of allocation. (R., V. 1, 175, 176.) It follows, therefore, that the Commission has no basis whatsoever in this Record that will in any manner support its findings as to the cost of service of the gas sold by Canadian to Colorado Interstate or as to the excess revenue over cost, if any, resulting from such sales and, therefore, there is no basis in the Record for any rate reduction order with respect to such sales.

It appears from the Commission's Opinion (R., V. 1, 176) that the "allocated costs" of gas sold to Colorado Interstate aggregated $1,575,000. It also appears from the Commission's Opinion in the paragraph just preceding the above finding that this "allocated costs" was based upon Lyon's Exhibit. This could not possibly be true for the very simple reason that neither Lyon nor any other Commission witness made any effort whatsoever to determine the "allocated costs" of the gas sold by Canadian to Colorado Interstate.

Since the $1,575,000 alleged cost of service of gas to Colorado Interstate is not based upon any evidence in the Record, it is reasonable to speculate upon the origin of the figure. We believe its source is self-evident. The Commission has taken Lyon's *allocated costs* in Exhibit 226 for all of Canadian's customers, *except Colorado Interstate*, and has deducted this amount from Canadian's total *actual* costs to get a synthetic cost of service for Colorado Interstate. After allowing for Commission adjustments, the figures in Lyon's Exhibit 226 fully support this conclusion.

Now this happy method of supplying missing evidence might not be so objectionable if the cost of service to Ca-

nadian's other customers had been allocated on Canadian's *actual* costs, but this was not the case. It is clear from the Record, as demonstrated in the preceding subdivisions of this argument, that in determining the "allocated costs" of Canadian with respect to its intrastate sales, Lyon included many of the "costs" of Colorado Interstate and thus inflated the true costs to Canadian of such intrastate sales, both at the wellhead and for resale to Dalhart, Texline, and Hartley. As has been shown heretofore, the "actual costs" experienced by Canadian were substantially less than the "allocated costs." This computation, of course, could not give the true cost of service experienced by Canadian with respect to the sales made to Colorado Interstate.

We reiterate that there is no basis whatsoever in the Record that will enable the Commission to determine the cost of service for gas sold by Canadian to Colorado Interstate and, therefore, its rate reduction order with respect to such gas is purely arbitrary. If we assume on the other hand that the Commission may, nevertheless, sustain its rate reduction order on the basis of "actual costs," then we earnestly insist that such "actual costs" cannot be determined simply by subtracting "allocated costs" assigned to the non-regulable sales from the total over-all "actual costs" incurred by Canadian. This cannot be done because such procedure does not give the correct "actual costs" of such sales, and neither does it give the correct "allocated costs" in accordance with Lyon's formula. The Commission has utilized inflated and excessive "allocated costs" to determine the cost of service for non-regulable gas, while it has used only a *residue* of actual costs to determine the cost of service for regulable gas. Either horn of the dilemma results in assigning an insufficient cost of service to the sales to Colorado Interstate and thus results in a greater rate reduction order against Canadian than the Record justifies.

3. *The Commission Has No Jurisdiction Over Direct Gas Sales by Canadian to Colorado Interstate for the Latter's Industrial Customers.*

The Commission ordered a blanket reduction in the sales price of all types of gas sold by Canadian to Colorado Interstate (R., V. I, 177) and denominated such gas as resale gas.

The Commission wholly ignored the fact that approximately one-half of the gas sold by Canadian to Colorado Interstate at Clayton Junction was sold to the latter for resale to direct industrial consumers. (R., V. 4, 2319.) This gas was not subject to the rate regulatory jurisdiction of the Commission for two reasons: (1) The Commission considered the properties of Canadian and Colorado Interstate as constituting one composite system, and (2) the Commission has no rate regulatory jurisdiction over gas sold by Colorado Interstate to its direct industrial consumers and, therefore, there is no basis for regulating the price of such gas sold by Canadian to Colorado Interstate.

Lyon's Exhibit 226 shows that the total sales to Colorado Interstate at Clayton Junction for resale in 1939 was 10,974,156 Mcf. (14.65 pressure base) and that the direct sales and sales to Colorado Interstate for its own use, neither of which is subject to rate regulatory jurisdiction of the Commission, amounted to 10,158,353 Mcf., and that sales to Colorado Interstate at Gray, Oklahoma, which gas was sold by the latter to Natural Gas Pipeline Company of America, were 20,783,301 Mcf. (R., V. 4, 2319.) The Record does not show what proportion of the sales to Natural Gas Pipeline Company constituted direct sale or resale gas.

It is apparent from the above, however, that as a very minimum approximately one-fourth of the total sales by Canadian to Colorado Interstate was gas that was intended to be sold and was sold directly to pipe line industrial consumers. Since the Commission had no jurisdiction over this type of sale and since it treated both lines as a unit, it follows that the contract price for this gas could not legally be changed by the Commission. Since this constituted approximately one-fourth of the total sales, it is apparent, therefore, that the rate reduction order was excessive in any event, and from this viewpoint alone by approximately $135,000 annually. As a matter of fact, the rate reduction order is excessive by a still larger amount for the reason, as hereinabove pointed out, that the cost of delivering the direct sale gas was much less per Mcf. than the cost of delivering the resale or regulable gas.

Commission counsel have heretofore taken the position that, notwithstanding the fact that the Commission has no jurisdiction over direct sales of Colorado Interstate, it, nevertheless, does have jurisdiction over all sales by Canadian to Colorado Interstate. Such construction is directly contrary to the wording and spirit of the Act.

Section 1 (a) of the Act (15 U.S.C. 717) declares that

> "* * * the business of transporting and selling natural gas *for ultimate distribution to the public is affected with a public interest*. * * *." (Italics supplied.)

Certainly, the sale of gas which is not sold, or distributed, or intended to be sold or distributed, "for ultimate distribution to the public" could not under the express language of the Act be said to be affected with a public interest. If such sales are not affected with a public interest, then it certainly follows that they are not subject to the rate regulatory jurisdiction of the Commission.

Section 1 (b) of the Act provides that the terms and provisions of the Act shall apply

> "* * * to the transportation of natural gas in interstate commerce, to the sale in interstate commerce of natural gas for resale for ultimate public consumption for domestic, commercial, industrial, or any other use, * * * but shall not apply to any other transportation or sale of natural gas * * *."

It is the provision just quoted that counsel for the Commission rely upon as the basis for their contention that all sales made by Canadian to Colorado Interstate are subject to the rate regulatory jurisdiction of the Commission. Counsel say that since such gas is resold by Colorado Interstate, the sales price may be regulated, even though much of such gas is sold directly to industrial consumers and is not sold for resale "for ultimate public consumption." This very narrow construction of the Act is in conflict with the clear provisions of Section 1 (a) and is not supported by Section 1 (b) of the Act even if such Section were considered separately and independently of Section 1 (a). It is clear, in any event, when the two are read together, that they express the clear

intent of Congress to regulate the sales price of gas transported and sold in interstate commerce only where such gas is later resold "for ultimate public consumption for domestic, commercial, industrial, or any other use, * * *." The phrase "for ultimate public consumption" modifies and restricts the subsequent language of the clause quoted. Clearly, the gas sold by Colorado Interstate to Colorado Fuel and Iron Corporation, for example, for consumption by the purchaser was not sold "for ultimate public consumption." On the other hand, gas sold by Colorado Interstate to the Public Service Company of Colorado, which latter company in turn resold the gas to the general public through its local distributing facilities in the City of Denver, was subject to the rate regulatory jurisdiction of the Commission, even though the distributing company sold a portion of such gas to industrial consumers. It is that latter type of sale that is obviously referred to in Section 1 (b) of the Act.

The contention of Commission counsel is fully answered by the provisions of Section 4 (e) of the Act which provide that when a natural gas company desires to increase its rates, the Commission may suspend such increases pending a hearing. It is then provided, however,

> "That the Commission shall not have authority to suspend the rate, charge, classification, or service for the sale of natural gas *for resale for industrial use only:* * * *." (Italics supplied.)

It is apparent that Section 4 (e) provides, in effect, that if Canadian increased its rates to Colorado Interstate for that portion of the gas sold to the latter company for resale to direct industrial consumers, the Commission could not suspend such rate increase. This being true, it follows that such gas is in no sense subject to the rate regulatory jurisdiction of the Commission. Otherwise, Congress would certainly have empowered the Commission to suspend such rates pending a hearing when and if increases were made.

It is clear from the above that Congress never intended to empower the Commission, and as a matter of fact did not

empower it, to regulate the price for gas sold directly by the pipe line company to a direct industrial consumer. Such sales are not "for ultimate public consumption." On the other hand, a sale made to a customer for the purpose of resale through a local distributing agency for "domestic, commercial, industrial, or any other use" is obviously a sale "for ultimate public consumption" and, consequently, the sale to such a customer, even though at wholesale, is subject to the rate regulatory jurisdiction of the Commission.

Let us assume, for example, that Canadian sold no gas to Colorado Interstate at all, except gas that was resold by the latter to Colorado Fuel and Iron Corporation for use at its steel mills at Pueblo. The Commission has no right to regulate the rates charged by Colorado Interstate for the sale of such gas. This being true, by what authority could it be said that the Commission could, nevertheless, regulate the price paid by Colorado Interstate to Canadian for this gas. Certainly, to regulate such sales, in so far as Canadian is concerned, and not to regulate them, in so far as Colorado Interstate is concerned, would constitute a foolish and vain exercise of rate regulatory jurisdiction. Since the ultimate sale cannot be regulated, there can be no occasion for regulating the intermediate sale.

The Commission's rate reduction order against Canadian in this case is directed against *all* sales of gas by Canadian to Colorado Interstate, including gas which is resold by Colorado Interstate directly to its pipe line industrial consumers as well as gas resold for ultimate public consumption. As heretofore pointed out, the Commission's failure to make a proper and jurisdictional separation and allocation between these two types of sales has resulted in increasing the Commission's rate reduction order by a substantial amount and in penalizing Canadian accordingly.

CONCLUSION

For each and all of the reasons hereinabove set forth, the judgment of the Circuit Court of Appeals should be reversed

and the case remanded, with instructions to vacate, set aside and enjoin the Order of the Commission.

Respectfully submitted.

APPENDIX "A"

The pertinent provisions of the Natural Gas Act of 1938 (52 Stat. 821, et seq.; Title 15, U.S.C.A., Sec. 717) are as follows:

Sec. 1(a) "As disclosed in reports of the Federal Trade Commission made pursuant to S. Res. 83 (Seventieth Congress, first session) and other reports made pursuant to the authority of Congress, it is hereby declared that the business of transporting and selling natural gas for ultimate distribution to the public is affected with a public interest, and that Federal regulation in matters relating to the transportation of natural gas and the sale thereof in interstate and foreign commerce is necessary in the public interest.

Sec. 1(b) "The provisions of this chapter shall apply to the transportation of natural gas in interstate commerce, to the sale in interstate commerce of natural gas for resale for ultimate public consumption for domestic, commercial, industrial, or any other use, and to natural-gas companies engaged in such transportation or sale, but shall not apply to any other transportation or sale of natural gas or to the local distribution of natural gas or to the facilities used for such distribution or to the production or gathering of natural gas."

Sec. 4(a) "All rates and charges made, demanded, or received by any natural gas company for or in connection with the transportation or sale of natural gas subject to the jurisdiction of the Commission, and all rules and regulations affecting or pertaining to such rates or charges, shall be just and reasonable, and any such rate or charge that is not just and reasonable is hereby declared to be unlawful.

Sec. 4(b) "No natural-gas company shall, with respect to any transportation or sale of natural gas subject to the jurisdiction of the Commission, (1) make or grant any undue preference or advantage to any person or subject any person to any undue prejudice or disadvantage, or (2) maintain any unreasonable difference in rates, charges,

service, facilities, or in any other respect, either as between localities or as between classes of service."

Sec. 4(e) "Whenever any such new schedule is filed the Commission shall have authority, either upon complaint of any State, municipality, or State commission, or upon its own initiative without complaint, at once, and if it so orders, without answer or formal pleading by the natural-gas company, but upon reasonable notice, to enter upon a hearing concerning the lawfulness of such rate, charge, classification, or service; and, pending such hearing and the decision thereon, the Commission, upon filing with such schedules and delivering to the natural-gas company affected thereby a statement in writing of its reasons for such suspension, may suspend the operation of such schedule and defer the use of such rate, charge, classification, or service, but not for a longer period than five months beyond the time when it would otherwise go into effect: *Provided*, That the Commission shall not have authority to suspend the rate, charge, classification, or service for the sale of natural gas for resale for industrial use only; and after full hearings, either completed before or after the rate, charge, classification, or service goes into effect, the Commission may make such orders with reference thereto as would be proper in a proceeding initiated after it had become effective. If the proceeding has not been concluded and an order made at the expiration of the suspension period, on motion of the natural-gas company making the filing, the proposed change of rate, charge, classification, or service shall go into effect. Where increased rates or charges are thus made effective, the Commission may, by order, require the natural-gas company to furnish a bond, to be approved by the Commission, to refund any amounts ordered by the Commission, to keep accurate accounts in detail of all amounts received by reason of such increase, specifying by whom and in whose behalf such amounts were paid, and, upon completion of the hearing and decision, to order such natural-gas company to refund, with interest, the portion of such increased rates or charges by its decision found not justified. At any hearing involving a rate or charge sought to

be increased, the burden of proof to show that the increased rate or charge is just and reasonable shall be upon the natural-gas company, and the Commission shall give to the hearing and decision of such questions preference over other questions pending before it and decide the same as speedily as possible."

Sec. 5(a) "Whenever the Commission, after a hearing had upon its own motion or upon complaint of any State, municipality, State commission, or gas distributing company, shall find that any rate, charge or classification demanded, observed, charged, or collected by any natural-gas company in connection with any transportation or sale of natural gas, subject to the jurisdiction of the Commission, or that any rule, regulation, practice, or contract affecting such rate, charge, or classification is unjust, unreasonable, unduly discriminatory, or preferential, the Commission shall determine the just and reasonable rate, charge, classification, rule, regulation, practice, or contract to be thereafter observed and in force, and shall fix the same by order: *Provided, however*, That the Commission shall have no power to order any increase in any rate contained in the currently effective schedule of such natural gas company on file with the Commission, unless such increase is in accordance with a new schedule filed by such natural gas company; but the Commission may order a decrease where existing rates are unjust, unduly discriminatory, preferential, otherwise unlawful, or are not the lowest reasonable rates."

Sec. 5(b) "The Commission upon its own motion, or upon the request of any State commission, whenever it can do so without prejudice to the efficient and proper conduct of its affairs, may investigate and determine the cost of the production or transportation of natural gas by a natural-gas company in cases where the Commission has no authority to establish a rate governing the transportation or sale of such natural gas."

Sec. 6(a) "The Commission may investigate and ascertain the actual legitimate cost of the property of every natural-gas company, the depreciation therein, and, when

found necessary for rate-making purposes other facts which bear on the determination of such cost or depreciation and the fair value of such property."

Sec. 9(a) "The Commission may, after hearing, require natural-gas companies to carry proper and adequate depreciation and amortization accounts in accordance with such rules, regulations, and forms of account as the Commission may prescribe. The Commission may from time to time ascertain and determine, and by order fix, the proper and adequate rates of depreciation and amortization of the several classes of property of each natural-gas company used or useful in the production, transportation, or sale of natural gas. Each natural-gas company shall conform its depreciation and amortization accounts to the rates so ascertained, determined, and fixed. No natural-gas company subject to the jurisdiction of the Commission shall charge to operating expenses any depreciation or amortization charges on classes of property other than those prescribed by the Commission, or charge with respect to any class of property a percentage of depreciation or amortization other than that prescribed therefor by the Commission. No such natural-gas company shall in any case include in any form under its operating or other expenses any depreciation, amortization, or other charge or expenditure included elsewhere as a depreciation or amortization charge or otherwise under its operating or other expenses. Nothing in this section shall limit the power of a State commission to determine in the exercise of its jurisdiction, with respect to any natural-gas company, the percentage rates of depreciation or amortization to be allowed as to any class of property of such natural-gas company, or the composite depreciation or amortization rate, for the purpose of determining rates or charges."

Sec. 10(a) "Every natural-gas company shall file with the Commission such annual and other periodic or special reports as the Commission may by rules and regulations or order prescribe as necessary or appropriate to assist the Commission in the proper administration of this chapter. The Commission may prescribe the manners and form

in which such reports shall be made, and require from such natural-gas companies specific answers to all questions upon which the Commission may need information. The Commission may require that such reports shall include, among other things, full information as to assets and liabilities, capitalization, investment and reduction thereof, gross receipts, interest due and paid, depreciation, amortization, and other reserves, cost of facilities, cost of maintenance and operation of facilities for the production, transportation, or sale of natural gas, cost of renewal and replacement of such facilities, transportation, delivery, use, and sale of natural gas. The Commission may require any such natural-gas company to make adequate provision for currently determining such costs and other facts. Such reports shall be made under oath unless the Commission otherwise specifies."

Sec. 11(a) "In case two or more States propose to the Congress compacts dealing with the conservation, production, transportation, or distribution of natural gas it shall be the duty of the Commission to assemble pertinent information relative to the matters covered in any such proposed compact, to make public and to report to the Congress information so obtained, together with such recommendations for further legislation as may appear to be appropriate or necessary to carry out the purposes of such proposed compact and to aid in the conservation of natural-gas resources within the United States and in the orderly, equitable, and economic production, transportation, and distribution of natural gas."

Sec. 14(b) "The Commission may, after hearing, determine the adequacy or inadequacy of the gas reserves held or controlled by any natural-gas company, or by anyone on its behalf, including its owned or leased properties or royalty contracts; and may, also, after hearing, determine the propriety and reasonableness of the inclusion in operating expenses, capital, or surplus of all delay rentals or other forms of rental or compensation for unoperated lands and leases. For the purpose of such determinations, the Commission may require any natural-gas company to file with the Commission true copies of all its

lease and royalty agreements with respect to such gas reserves."

Sec. 19(b) "Any party to a proceeding under this chapter aggrieved by an order issued by the Commission in such proceeding may obtain a review of such order in the circuit court of appeals of the United States for any circuit wherein the natural-gas company to which the order relates is located or has its principal place of business, or in the United States Court of Appeals for the District of Columbia, by filing in such court, within sixty days after the order of the Commission upon the application for rehearing, a written petition praying that the order of the Commission be modified or set aside in whole or in part. A copy of such petition shall forthwith be served upon any member of the Commission and thereupon the Commission shall certify and file with the court a transcript of the record upon which the order complained of was entered. Upon the filing of such transcript such court shall have exclusive jurisdiction to affirm, modify, or set aside such order in whole or in part. No objection to the order of the Commission shall be considered by the court unless such objection shall have been urged before the Commission in the application for rehearing unless there is reasonable ground for failure so to do. The finding of the Commission as to the facts, if supported by substantial evidence, shall be conclusive. If any party shall apply to the court for leave to adduce additional evidence, and shall show to the satisfaction of the court that such additional evidence is material and that there were reasonable grounds for failure to adduce such evidence in the proceedings before the Commission, the court may order such additional evidence to be taken before the Commission and to be adduced upon the hearing in such manner and upon such terms and conditions as to the court may seem proper. The Commission may modify its findings as to the facts by reason of the additional evidence so taken, and it shall file with the court such modified or new findings, which if supported by substantial evidence, shall be conclusive, and its recommendation, if any, for the modification or set-

ting aside of the original order. The judgment and decree of the court, affirming, modifying, or setting aside, in whole or in part, any such order of the Commission, shall be final, subject to review by the Supreme Court of the United States upon certiorari or certification as provided in sections 346 and 347 of Title 28, as amended."

SUBJECT INDEX.

	Page
Introduction	1
Question 1	1
Jurisdiction Over Production and Gathering	1
The Argument that the Regulation of Production and Gathering Forbidden by Section 1(b) of the Natural Gas Act Relates Only to the "Activity" of Producing Natural Gas	3
The Argument that the Language of Exclusion in Section 1(b) is Surplusage	6
The Argument That the Commission's Habit in This Direction Now Has the Force of Law	6
The Argument That Other Sections of the Act Authorize the Commission to Ascertain the Cost of Production and Gathering Facilities	7

IN THE

Supreme Court of the United States

OCTOBER TERM, 1944.

No. 380.

CANADIAN RIVER GAS COMPANY, a corporation, *Petitioner*,

v.

FEDERAL POWER COMMISSION, CITY AND COUNTY OF DENVER, COLORADO, PUBLIC SERVICE COMMISSION OF WYOMING, COLORADO-WYOMING GAS COMPANY, PUBLIC SERVICE COMPANY OF COLORADO, AND COLORADO INTERSTATE GAS COMPANY, *Respondents*.

REPLY BRIEF OF PETITIONER.

This reply brief is filed pursuant to leave of Court granted at the oral argument of this cause. The same abbreviations used in our opening brief are here followed.

QUESTION 1.

Jurisdiction Over Production and Gathering.

This is a vital issue from the standpoint of every interest—this Petitioner, the natural gas industry, and the public represented by the several states. It affects every phase

of this industry from the pipeline down to the royalty owner in the field. If, despite the plain words of Congress, this Court should hold that the Commission possesses rate-making authority in the area of production and gathering of natural gas, no action in the gas fields will be immune to Federal control, for he who holds the purse strings controls all.

The Commission's position on this issue is that Congress did not mean what it said in Section 1(b) of the Natural Gas Act, that it used wholly nugatory language in its attempted exclusion of these operations from the purview of that statute, and that the Circuit Court was wrong when it ruled that the Commission has no rate-making jurisdiction, express or implied, in this arena.

Indeed, though it has not appealed from the judgment of the Circuit Court, the Commission now repudiates and seeks to escape from both rulings of that Court on this issue. The Circuit Court held that there is no jurisdiction vested in this administrative body to fix rates for the production and gathering elements of Petitioner's business, but that, on the facts, the Commission had not done that. The Commission now argues that it does possess that jurisdiction, and it admits—as it must—that it exercised it in this case. By adopting this position the Commission wholly abandons the Circuit Court and leaves both its ruling and its finding dangling in midair.

In brief, the argument of the Commission is to the effect that the exception of power over production and gathering in the Act relates solely to the "activity" of producing natural gas (omitting all reference to the "gathering" function); that since the Commission has been in the habit of including producing and gathering properties and expenses in its ratemaking processes, such practice has in some fashion become hallowed by usage; that other sections of the Act authorize factual ascertainment of costs in connection with these activities; that the Commission told Congress in a report that it was its habit to include

these factors when fixing rates, and that, since Congress did not re-examine that situation when it recently amended the certification provisions of the Act, it had placed its stamp of approval on this practice. We desire to comment briefly on each of these arguments.

The Argument that the Regulation of Production and Gathering Forbidden by Section 1(b) of the Natural Gas Act Relates Only to the "Activity" of Producing Natural Gas.

The Commission concedes that this statute withholds from its regulatory powers the "activity" of producing natural gas. It illustrates its conception of such "activity" by admitting that it is debarred from control over "the determination of the drilling or spacing of wells in the field, the number of wells to be drilled in a common reservoir, proration of the production of oil or gas, or cycling or other recovery operations." (Com. Br., p. 19.)

It is significant that every activity thus enumerated relates solely to the "conservation" of natural gas and the prevention of waste in its production. It is further significant that no single element thus listed has, or could have, the slightest bearing on the other prohibited area of jurisdiction,—that of the "gathering" of gas after its "production." Obviously, it is essential to bring gas produced from numerous wells (perhaps quite distant one from the other) to a common point, where it can be delivered to the main transmission pipeline. Congress forbade the Commission to exercise authority over this necessary function by language as clear as was used in respect to mere production. Yet the Commission, by silence on the point, would apparently seek to have this process and activity wholly ignored by this Court. We cannot believe that such maneuver could hope for success.

Moreover, the only "activities" with respect to production that are now admitted by the Commission to be without the ambit of its authority are "activities" relating

to the "conservation" of natural gas in the field,—a subject universally recognized to be within the sphere of state authority and not within that of the Federal Government. This is a proposition so clearly self-evident that the citation of authorities seems unnecessary. These are matters generally recognized as being reserved to the states under our Federal Constitution, and in fact this Act so recognizes (in Section 11(a)) by providing that the Commission shall aid and assist the states in matters pertaining to the conservation of natural gas.

But even under the Commission's argument, it could hardly be imagined that control of the purse strings does not, in truth and effect, control these very items of state jurisdiction over which the Commission now disclaims authority. The Commission would include in its overall rate base at original (or "ab-original") cost all properties used in production, as well as in gathering (to which the admittedly non-jurisdictional "activities" have no application in any event). The Commission would fix and enforce a straight-jacket rate of return upon those properties, so included at such original cost. The Commission would determine what allowances should be made for working capital to carry on these operations. The Commission would determine what future capital additions should be allowed for the acquisition of gas leaseholds, the drilling of wells and the construction of gathering facilities. Yet, the Commission would have this Court believe that by thus exercising the power to fix the rates, and thus the earnings applicable to such activities, it does not, from every rational and realistic viewpoint, control or seek to control each and every activity connected directly or indirectly with the production and gathering of natural gas.

If it should be argued that these activities result in "sales" in interstate commerce for resale, and that they are therefore blanketed into the ambit of the Commission's rate-making powers, despite the express exception of "production and gathering" in the statute, the result envisaged

by the Commission can only be a multiplicity of separate and individual sale prices fixed by that body for the literally thousands of producers in the nation's gas fields, whenever they make sales to interstate pipelines. Such a result would inevitably follow the announcement of any such doctrine, yet we understand it to be the Commission's position that it neither seeks jurisdiction to engage in such multitudinous rate-fixing efforts, nor believes such action to be covered by the Act. Consistency demands that either all or no such sales in the field be held so subject, and in view of the language used by Congress we submit that none is so subject.

Finally, the Commission argues that, in any event, it possesses authority to include the producing and gathering properties and expenses in the development of rates and the establishment of allowable return in instances where a "natural-gas company" produces and gathers the gas which it later transports in interstate commerce and sells for resale. In this connection, it seems pertinent to inquire to whom Congress may have directed the exclusion of production and gathering in Section 1(b), if not to this very situation.

Congress, significantly, did not choose to delegate jurisdiction over those production and gathering operations found to "affect" or "burden" or "obstruct" interstate commerce. Obviously, therefore, if Congress by its chosen language of exclusion meant somehow to include (by silence) an exception where gas eventually enters interstate commerce, it certainly did not intend to confer rate-fixing powers as to any company *not* engaged in such interstate commerce. The jurisdictional exclusion of producing and gathering must thus relate solely to such operations when conducted by a "natural-gas company," as defined in the Act (i.e., one which is engaged in the transportation of natural gas in interstate commerce, or the sale in interstate commerce of such gas for resale. Sec. 2(6)).

If this be true, and if we were to accept the Commission's view that its jurisdiction over the producing and gathering properties of a natural-gas company devolves from the fact of later interstate commerce, the words of Section 1(b) must be read out of the Act as mere surplusage.

The Argument that the Language of Exclusion in Section 1(b) is Surplusage.

As a matter of fact, the reading out of the Act of the exclusion language of Section 1(b) as largely, if not wholly, surplusage is precisely what the Commission now argues. It quotes from a Report of the House Committee which reported the Bill (H. R. 6586, 75th Cong., 1st Sess.) which became this Act, but a reading of this quotation shows that the statement about surplusage had reference to the local distribution rather than the production and gathering of natural gas (Com. Br., pp. 20-21). Contrary to the impression which the Commission seeks to leave with the Court in this regard, the entire legislative history of this statute (discussed at length in the brief of the Independent Natural Gas Association of America, *amicus curiae*) discloses how clearly Congress intended *not* to vest in the Commission *any* rate-fixing powers in *any* case over the production and gathering of natural gas. As there shown, the then Solicitor for the Commission, as well as the Chairmen of the Congressional Committees having charge of the bill, so stated in unequivocal language. This factor was unquestionably to be left to "competitive forces in the gas fields."

The Argument that the Commission's Habit in this Direction Now Has the Force of Law.

It is said that the Commission has all along habitually included producing and gathering properties and expenses in fixing the rates of natural gas companies, and that this practice has been hallowed by usage until it has been clothed with the force of law. It is said that this Court did not

strike down such action in the two rate cases which have already arisen under this Act, and that therefore the possession of this power has been judicially validated.

The cases in question are those of *Federal Power Commission* v. *Natural Gas Pipeline Company of America*, 315 U. S. 575 and *Federal Power Commission* v. *Hope Natural Gas Company*, 320 U. S. 591. Suffice it to say that in neither of those cases was this point even raised by the companies under consideration. It would be heterodox doctrine, indeed, to hold that in such a situation this Petitioner is now barred from making its contention. The acquisition of jurisdiction over one entity because of default or waiver by another could hardly be urged, since even waiver by the Petitioner itself at some stage of the proceeding could not—under universally recognized principles—be deemed to vest jurisdiction in the Commission over an element excluded by Congress from the vested powers.

The Argument that Other Sections of the Act Authorize the Commission to Ascertain the Cost of Production and Gathering Facilities.

As was stated in Petitioner's opening brief, we are not here questioning the inquisitorial powers granted to the Commission under Sections 5(b), 9(a), 10(a), 11(a) or 14(b) of the Act. Even a cursory examination of these sections would show that they grant only powers to investigate for the purpose of aiding the Commission in the exercise of its jurisdiction over facilities and operations expressly granted by Congress, or in aid of the exercise of jurisdiction reserved to state regulatory bodies, or in aid of legislation. There is nothing new or novel in the extension of necessary powers for this purpose. Their inclusion in the Act for this purpose is perfectly consistent with the production and gathering exclusion clause set forth in Section 1(b) of the Act. When read and interpreted in this manner the Act as a whole, with respect to the Commission's jurisdiction over production and gathering, makes sense, and it is not necessary to indulge in any leger-

demain which would relegate the exclusion clause in Section 1(b) to the status of mere surplusage.

Sections 6(a) and 6(b), relied upon by the Commission, authorize it to investigate and ascertain the original cost of properties of natural gas companies, and to require the filing of inventories and statements of original cost. *These subsections do not even mention production or gathering properties*, and accordingly contain no support for the Commission's claim that it may exercise rate regulatory jurisdiction over such properties or operations.

The power granted to the Commission in Section 14(b) to determine the adequacy or inadequacy of gas reserves is essential in many cases to determine the proper rates of depreciation or amortization to be allowed upon transmission facilities used in transporting natural gas in interstate commerce. The powers granted to the Commission in Section 14(b) with respect to delay-rentals as compensation for unoperated lands and leases are of importance to the Commission in the maintenance of uniform systems of accounting.

Notwithstanding the implications which the Commission attempts to draw from Section 14(b), it will be noted that the title to Section 14 as a whole and as enacted by Congress, is as follows: "*Investigations by Commission; attendance of witnesses; depositions.*"

The Commission (Com. Br., p. 38), in referring to the legislative history of Section 14(b), alludes to the fact that it was taken from H. R. 5711 (75th Cong., 1st Sess.) which was under consideration at the same time as H. R. 4008 of the same Congress and Session. The circumstances surrounding the transferral of this subsection from H. R. 5711 bear out our contention that the authority given the Commission in Section 14(b) was merely a power to investigate in connection with the determination of depreciation charges and other accounting matters. The subsection, as contained in H. R. 5711 (with the exception of the requirement for the filing of lease and royalty agreements), was in

Section 16 of that bill, entitled "Rates of Depreciation." A provision requiring the filing of lease and royalty agreements was contained in Section 12 of H. R. 5711 entitled "Rates and Charges" (Hearings on H. R. 4008, 75th Cong., 1st Sess., pp. 13, 15). However, when the House Committee reported out H. R. 6586 (the bill which became the Natural Gas Act) the provision requiring the filing of lease and royalty agreements was not included in the *rate* provisions (as contained in H. R. 5711) but was combined with the provision permitting the Commission to determine the adequacy or inadequacy of gas reserves (which had been under the "Depreciation" section of H. R. 5711) and included both provisions in what is now Section 14(b) under the general heading of "Investigations."

The Argument that the Uniform Administrative Interpretation of the Commission Consistently Has Been to Consider Production and Gathering Facilities in Fixing the Rate Base, and the Commission Has So Reported to Congress.

The purpose and value of this argument, even though sound from a factual standpoint, is not clear. However, it is readily answered in any event. The Commission quotes a portion of its Twentieth Annual Report to Congress for the year 1940, as follows:

> "4. *Gas reserves.*—As the natural-gas industry is an extractive industry, *one of the important elements of cost which must be determined pertains to the exhaustion of the service life of the properties due to the depletion of the natural-gas reserves which the properties were constructed to produce or transport.* The Commission's geologists have been engaged in estimating the volume of gas reserves in a number of important fields, among them the Panhandle field in Texas, the Hugoton field in Kansas and a major portion of the fields located in West Virginia, Pennsylvania, and New York. A few years' difference in the estimated life of available gas reserves supplying a given market may

make a large difference in the rates which can be justified for that area.' [Emphasis supplied.]" (Com. Br., pp. 27-28.)

The Commission fails to quote, however, a section of the same report immediately preceding the above, which reads as follows:

"3. *Service life.*—Because of the lack of adequate data in the industry for the determination of reasonable depreciation allowances, it has been necessary to have members of the staff make comprehensive studies of the service lives of various kinds of depreciable property." (p. 77.)

It is quite obvious that in Item 4 of its Report the Commission is talking about investigations of gas reserves for the purpose of determining depreciation or amortization rates on transmission facilities pursuant to the authority granted to it in Sections 9(a) and 14 of the Act. There is not even a hint here to Congress that the Commission was at that time claiming full rate regulatory jurisdiction over production and gathering. As a matter of fact, in the same report, under the title "*Commission recognizes limits to jurisdiction,*" the Commission has the following to say with respect to its rate regulatory powers over producing operations:

"During the year the Commission suspended a proposed increase in rates filed by the Columbian Fuel Corporation for natural gas sold to the Warfield Natural Gas Co. for resale. Following hearings regarding the suspension, the company filed a special petition requesting a hearing as to the jurisdiction of the Commission over the particular sale and over the Columbian Fuel Corporation generally.

"Widespread interest developed concerning this question of jurisdiction. The Public Service Commissions of Kentucky and West Virginia, the Mid-Continent Gas & Oil Association, the Independent Petroleum Association of America, and the National Association of Railroad and Utilities Commissioners all requested permission to intervene or to file briefs. The Commis-

sion granted opportunity for oral arguments on the question by interested parties, which it heard sitting *en banc*.

"In its opinion and order the Commission dismissed the entire proceedings, finding that the Columbian company was engaged only in the production of gas and that the Commission had no jurisdiction over the arms-length sale of natural gas at the well mouth."

If it were a matter of common knowledge to the members of Congress and in the industry and elsewhere that through administrative practices and interpretation the Commission had acquired rate regulatory jurisdiction over production and gathering by default, then certainly this fact escaped the notice of the Circuit Court, because, as heretofore stated, that Court held that the Commission does not have express or implied rate regulatory jurisdiction over the production and gathering of natural gas. Such holding found ample support in the *Natural Gas Pipeline case* and *Hope case* heretofore decided by this Court and quoted in petitioner's opening brief.

The Argument that Congressional Approval of the Administrative Interpretation of the Act May be Inferred from the Fact that Section 7 Was Amended by Congress in 1942 With No Other Legislative Change in the Act.

Reference to Section 7 of the Act will show that it has to do with the issuance of certificates of public convenience and necessity by the Commission. It has no relation whatsoever to the production or gathering of natural gas. Certainly, an amendment to an unrelated section of the Act by Congress cannot by any theory of acquiescence or otherwise serve to bind Congress to the Commission's interpretation or administrative practices with respect to other sections of the Act. If this were true neither Congress nor the Courts nor anyone else could with certainty determine the status of the law.

The argument is false in any event, because the amendment in question to Section 7 was enacted in February 1942. The decisions of this Court in the *Natural Gas Pipeline case* and the *Hope case* were handed down subsequent to that date. Likewise, the decisions of the Commission with respect to all of the natural gas pipeline cases (including that of Petitioner) now before this Court were handed down by the Commission subsequent to that date. As heretofore stated, the Circuit Court in this case has held that the Commission does not have rate regulatory jurisdiction over production and gathering, and that such holding finds ample support in the decisions of this Court in the *Natural Gas Pipeline case* and the *Hope case*.

If Congress is to lose its powers by acquiescence, or is to have its laws repealed by administrative practice, must its alertness and diligence be directed to the decisions of the courts or to the administrative practices and interpretations of the bureaus?

The Commission alludes to the circumstance that Section 7 (the certificate section) of the Act was amended by Congress in 1942, and apparently seeks to convey to the Court the impression that Congress approved its administration of the Act, including assumption of jurisdiction over production and gathering (Com. Br. 28). Neither the general reference made by the Commission, nor the specific references to pages of the hearing before the House Committee, support the Commission's contention. We have diligently examined the references given by the Commission and find no support whatever for its statements. At pages 34-35 of the hearing Mr. W. A. Dougherty, appearing for certain natural gas companies, was asked by Congressman Wadsworth whether the matter of regulation, since the passage of the Act, was still in its formative stages, and Mr. Dougherty responded to the general effect that it was, that the Commission was then in the process of considering its first major rate proceeding, and that within the next year or two certain major problems, including jurisdictional ques-

tions, would undoubtedly be determined. At pages 40-46 of the hearing, also referred to by Respondents, Mr. John E. Benton, General Solicitor for the organization of state regulatory commissions, testified and objected to a contention made by a member of the staff of the Commission that the Commission could control the intrastate operations of a Kentucky company. Mr. Benton, under interrogation by Congressman Boren, stated that the Commission had not yet taken jurisdiction over local distribution; and, in respect to the Kentucky case, was specifically interrogated by Congressman Boren as follows (Hearing, p. 42):

> "Mr. Boren. Just one interruption there. Do you mean the Federal Power Commission assumed jurisdiction over the gathering lines in the producing area?
>
> "Mr. Benton. No, I do not, Mr. Congressman."

At pages 60-61 of the hearing, also cited by the Respondents, testimony was given by Mr. J. J. Hedrick, attorney for the Natural Gas Pipeline Company of America and under interrogation on general matters by Congressman Boren, stated that there had been no appreciable expansion of pipeline facilities since the passage of the Act; that his company had been in a rate case with the Commission for two years, which was then pending in the courts and had not at that time been completed.

We have summarized the portions of the hearing on H. R. 5249, relied upon by the Commission in its brief, because we believe that it refutes the Commission's contention that at such hearings "the Commission's administration of the Act was fully explored" and apparently tacitly approved by Congress. We cannot avoid the observation that the Commission has apparently become desperate when it attempts to sustain its claim of jurisdiction over production and gathering by citing and relying upon legislative material in no way pertinent and containing not one iota of support for its contentions.

The Answer is to Use the Appropriate Field or Commodity Value of Gas as a Measure of Allowable Expense.

In its brief before the Circuit Court, the Commission took the position that the exercise of rate regulatory jurisdiction over production and gathering was "indispensable" to the exercise of its jurisdiction over interstate transportation and sales. In Petitioner's opening brief before this Court, two answers were made to this contention, first, that indispensability of jurisdiction is legally immaterial if Congress has in fact withheld rate regulatory jurisdiction from the Commission; and second, that rate regulatory jurisdiction over production and gathering is not, in any event, "indispensable" because the Commission has a perfectly logical and practical starting point for the purposes of exercising its jurisdiction over interstate transportation and sale of gas, i.e., *the field price of gas at the well-head and at the end of the gathering operation for pipeline purposes.*

The Commission does not emphasize the indispensability argument in its brief filed in this Court, but it does contend that the field or commodity price concept is unrealistic; that the only substantial markets are those of the large pipelines which fix their own prices; and that the supply exceeds the demand. (Com. Br. 15.)

There is no evidence in this record to support any such statements. The case of *Thompson* v. *Consolidated Gas Co.*, 300 U. S. 55, cited by the Commission to support its views, is based upon a factual situation existing in 1935, ten years ago, and does not in any sense represent present conditions in the field. The only evidence in this record as to the field or commodity value of gas for pipeline use in the Texas Panhandle Field was presented by Canadian through its witness Superintendent R. A. Ford, who had been connected with Canadian's field operations from their commencement in 1928. (R., V. 6, 3255-3281.) A review of his testimony discloses that he investigated every material contract for the purchase of gas by pipelines in the Texas

Panhandle Field to determine the current prices applicable to the purchase and sale of gas in arm's-length transactions; that he investigated and determined the price being paid generally to royalty owners for their portion of such gas under leases requiring royalty settlements on a current market basis; and that, based upon such investigations, he had found that the going field price for natural gas in the Texas Panhandle Field for pipeline uses was a minimum of 4¢ per MCF at the well-head and 7¢ per MCF at the end of Canadian's gathering system (both prices at 16.4 pounds pressure base).

There is now, and has been over a long period of years, a definite field or commodity price for natural gas *for pipeline use* in the Texas Panhandle Field. As a matter of fact, thirty days after the first foot of gas was produced and sold by an operator for pipeline use under a lease requiring settlement of the royalty owner's portion of such gas on a current market value basis, it became necessary to determine such current market value for that use. There are literally hundreds of such leases and literally thousands of such royalty owners in the Texas Panhandle Field who have a vital interest every month in the correct determination of such market value as a measure of the payments they are entitled to receive by reason of gas production. Determination of such field market value has been a matter of day-to-day practice in the Texas Panhandle Field for a period of over 25 years. In many cases, where the producer and the royalty owner have been unable to agree upon market value, the parties have resorted to litigation and the courts. After considering all of the circumstances and conditions, the courts have then determined such field or commodity value.

Since about 1931 the State of Texas has had a so-called Severance Tax Law which levies annually a tax upon the market value of gas produced at the mouth of the well. (H. B. 8, Chap. 184, Acts of 47th Texas Legis., Regular Session 1941, P. 269, and prior laws.) Obviously, in the

assessment of such tax, it is necessary for the State of Texas to investigate and determine annually the field price or market value for gas at the well-head, which it has done regularly.

Over a long period of years lessors and lessees, producers and royalty owners, as well as the courts and the State of Texas for tax purposes, have had no difficulty in ascertaining the current market value of gas produced in the Texas Panhandle Field. It would seem that the Commission stands alone in its perplexity and professed inability to obtain the answer to a problem which others have found relatively simple. As a matter of fact, if the Commission really entertains any special concern about the *bona fides* of the market value of gas produced in the Texas Panhandle Field and used in the pipelines which transport it in interstate commerce, we would suggest that the Commission may well calm its fears and rely upon the eternal vigilance of independent producers, royalty owners and the State of Texas to make certain that such market values are fair and reasonable at all times.

QUESTION 2.

Impropriety and Invalidity of Including Natural Gas Leaseholds in a Rate Base on an Original Cost Formula or Prudent Investment Theory.

The Commission's treatment of this question is found at pages 29 to 36 of its brief.

We shall in summary form reply to the attempted answer of the Commission to our position that even assuming that the Commission has rate regulatory jurisdiction over production and gathering, it is improper under the circumstances disclosed in this case to include Canadian's natural gas leaseholds in a rate base at the Commission's conception of original cost.

1. On pages 29-32 of its brief, the Commission intimates that it considered and rejected Wallace's testimony as to

the present fair market value of Canadian's gas leaseholds on its merits, and cites *Dayton Power & Light Co. v. Commission*, 292 U. S. 290, 299, in justification.

This is not the case, as clearly appears from the Commission's Opinion. The Commission stated in its Opinion, "Commission restricted its plant studies to original cost and offered evidence of that character." (R., V. 1, 148.)

The Commission then continued, "We find, therefore, in accordance with the provisions of Section 6 of the Natural Gas Act and under the record in this proceeding, no necessity exists to consider other factors than original cost of the properties and service." (R., V. 1, 148.)

A search of the Commission's Opinion will disclose absolutely no discussion of, or even reference to, the evidence in the Record relating to the market value of Canadian's gas leaseholds. This evidence is entirely ignored.

This treatment is entirely consistent with the announced policy of the Commission to use original cost (as defined by it) in the rate base to the exclusion of all evidence of value. This policy of the Commission has been expressly and openly stated time after time by the Commission.

In *City of Detroit, et al. v. Panhandle Eastern Pipe Line Co., et al.*, 45 P. U. R. (N.S.) 203, the Commission states:

> "We held in the Chicago District Electric Generating Case that under Section 20(a) of the Federal Power Act (the provisions of which are identical with Section 6(a) supra), that reproduction cost evidence is inherently fallacious, and should be disregarded under that statute.
>
> "It is not deemed necessary to discuss at great length the defects and vagaries of reproduction cost evidence. The manifold reasons why such evidence is fallacious, and is obstructive of the regulatory process, have been fully expounded by members of the Supreme Court and by this Commission.
>
> "Moreover, in the light of the many expressions emanating from the highest court in the land and the opinions of competent experts in the regulatory field,

> it seems evident that Congress recognized the fallacy of the reproduction cost doctrine, and sought by the enactment of Section 6(a) *to shelve that illusory concept as a requisite in rate making.*" (Italics supplied.)

Consistent with that announced policy this Court will note from the briefs in the *Panhandle Eastern Pipeline* case (No. 296, this Term), which was argued at the same time as this case, that the Commission, in the *Panhandle Eastern Pipeline* case refused to permit the introduction of evidence of the market value of the gas leaseholds there involved.

Likewise, in the *Cities Service Gas Company* case, decided by the Commission on July 28, 1943 (59 P.U.R., (N.S.) 65), which is now pending on review in the Circuit Court of Appeals for the Tenth Circuit in Case No. 2813 of that Court, the Commission again announced its adherence to this policy in the following language:

> "At the threshold we are met with the Company's contention that the trial examiner improperly excluded evidence of * * * so-called 'fair value' of the properties. Our view as to why such evidence should be excluded has been stated in earlier opinions. (Note: of the Commission.) * * * Moreover, the Company's estimates of * * * so-called 'fair value' are at best synthetic figures not taken from the books and records. They do not purport to represent actual cost or investment. Upon such record, we find that no necessity was shown to exist for the consideration of evidence of * * * 'fair value' in this proceeding."

It is absolutely clear, therefore, that the Commission did not consider and reject in this case the evidence as to the fair market value of Canadian's leaseholds on the merits, but ignored such evidence entirely in adherence to its consistently announced policy that all evidence of this nature is immaterial.

It thus follows that the opinion in the *Dayton Power & Light Company* case is inapplicable because in that case

the evidence of fair value was considered on its merits and rejected on its merits.

Finally, the evidence of fair value in the *Dayton* case which was so considered and rejected on its merits was entirely different from the evidence of fair value in the case at bar. In the *Dayton* case the opinion evidence as to value there rejected was based upon a regulated price and continued connections with regulated pipelines, and the Court's position was that the question of value of the leaseholds was so closely connected with the price that might be received from time to time under regulation that the opinion must necessarily be conjectural. In the present case, on the contrary, Wallace (R., V. 6, 3181-3254), after analyzing each of Canadian's leaseholds in detail, including the date of completion of the wells, the initial open flow and rock pressure, the present open flow and rock pressure, and the production to date, and after testifying as to actual sales of other acreage in the same Texas Panhandle Field, gave his opinion as to the market value of each of Canadian's leaseholds and as to the aggregate value of all of them. In doing this, Wallace *expressly stated that he had not considered as a value factor the fact that the wells were connected to pipelines and had not considered any contracts which Canadian had for the sale of its gas, and that if Canadian's acreage were available for a sale it could unquestionably secure an outlet for its gas, exclusive of any pipeline in the field.* (R., V. 6, 3191, 3194)

This clearly distinguishes the leasehold market value evidence in the present case from that which was introduced, considered and rejected on its merits in the *Dayton* case. We submit therefore that it was the duty of the Commission in the present case at least to consider Wallace's testimony on its merits, which it did not. If it had, we believe the difference in the character of Wallace's testimony and that considered in the *Dayton* case would have been easily recognized.

The simple fact is that the fair market value of Canadian's gas leaseholds was established in this case by un-

controverted evidence which has been entirely ignored by the Commission in blind adherence to its so-called original cost or prudent investment rate base policy.

2. In a footnote on page 30 of its brief, the Commission disputes the statement in our brief that Canadian's *bare leaseholds* have been included in the Commission's rate base at something less than $1,000,000; and the Commission has attached to its brief as Appendix D a sheet setting forth certain figures which, according to the Commission, refute our statement.

Of course, as a practical matter it does not make much difference which one of us is correct in this connection, for even if the Commission is correct, admittedly the leaseholds have been included in the Commission's rate base at much less than their actual value and at much less than Canadian's actual original cost. However, we cannot concede that the Commission is correct. This Appendix D that the Commission has attached to its brief is not a copy or reproduction of any testimony or exhibit introduced in evidence in this case. Where the Commission may have secured these figures we do not know. We do know, however, that the Commission's Opinion is in such general language, with no detailed supporting findings for the ultimate findings, that when the Opinion was handed down we requested the Commission to allow us to examine its staff's working papers or otherwise to inform us as to the nature of the underlying figures used by the Commission in arriving at its ultimate figures as set forth in its Opinion. Our request was refused.

Furthermore, it appears from the Appendix D attached to the Commission's brief that it has added a number of extraneous items to the "*bare leasehold cost*," which we are discussing in our brief. Finally, we submit that the figures used in our brief are accurate and entirely justified by the Record. In fact, the $1,604,020.61 starting point figure is taken directly from the Commission's own Exhibit 146, sheets 62-64, R., V. 5, 2717, 2721, and the $653,681.00 deduc-

tion made from this starting point figure for depletion is taken directly from the Commission's Opinion. (R., V. 1, 186).

3. The Commission makes the same criticism of the uncontradicted evidence in this case establishing the market value of Canadian's gas as a commodity at the wellhead and at the end of the gathering system as it did to Canadian's evidence covering the fair market value of its leaseholds. We make the same reply to this contention as we have made above with reference to the Commission's treatment of the uncontradicted evidence in this case which established the market value of Canadian's leaseholds. The Commission did not consider and reject on its merits the evidence in this case as to the commodity value of Canadian's gas, but ignored such evidence entirely as a matter of legal principle. The evidence in this case on the commodity value of Canadian's gas is not only evidence introduced by Canadian, but also is corroborated by evidence introduced by the Commission itself. It is based upon actual arm's-length contracts for the sale and purchase of gas in the Texas Panhandle Field and upon royalties payable on a market value basis in that field pursuant to arm's-length negotiated leases and contracts. This evidence is not limited to Canadian's gas, but is fieldwide. (R., V. 6, 3255-3281.)

4. On pages 32 *et seq.* of its brief, the Commission indicates that there can be no commodity market value of Canadian's gas. It volunteers the statement, not supported by any evidence in the Record, that the only markets which are available are located at distant points; that the major pipeline companies control these markets; and that if these particular markets were lost there would be little if any commodity value to Canadian's gas or to other gas in this field, and the Commission in its brief concludes on page 34 with the astounding statement that "prevailing prices accordingly do not establish a commodity value."

We have replied to this desperate argument at the conclusion of our reply on Question 1, *supra*, and will not repeat our reply here. In addition thereto, it is a fact that in 1939 (the test year applied by the Commission in this case) substantially less than 50 per cent of the total gas production in the Texas Panhandle Field was sold to and utilized by pipelines for light and fuel purposes. Of the gas so sold and utilized by pipelines, a substantial portion was confined to intrastate commerce; and of the gas that moved by pipeline in interstate commerce, a large portion was sold by the pipelines directly to consumers. Neither intrastate sales nor direct sales in interstate commerce are subject to the jurisdiction of the Commission. (See 1940 Annual Report of Railroad Commission of Texas, covering Panhandle Oil and Gas Field, Table VIII.)

5. On page 36 of its brief, the Commission makes the following amazing statement:

> "Finally, if the commodity price rather than cost were adopted by the Commission there would no longer be any necessity for treating the gas business as presenting any peculiar hazards. As a result, the transmission facilities, which constitute the larger portion of the pipe lines investment, would be entitled to a lower rate of return than 6½%."

In the first place, this statement carries with it the implicit admission that the production of natural gas is an extra hazardous business and that a 6½ per cent rate of return on an original cost rate base is fair only for a business involving fewer hazards. From this it logically follows that the 6½ per cent rate of return allowed by the Commission in this case is inadequate as to the admittedly hazardous portion of Canadian's business, namely its production and gathering. Two-thirds of the entire rate base allowed by the Commission in this case covers production and gathering properties. So, by the Commission's own admission, an inadequate rate of return has been allowed on over $6,000,000, which constitutes the amount at which Canadian's pro-

duction and gathering properties have been included in the rate base on the Commission's prudent investment or original cost theory.

Again in this quoted paragraph the Commission admits that the transmission business is a hazardous business where the production and gathering properties are included in a rate base on an original cost basis, but states that the transmission business would become at least less hazardous if the commodity price of natural gas should be adopted. Inasmuch as the Commission has included Canadian's production properties in the rate base on an original cost basis and thus made the transmission end of the business hazardous, it follows from the Commission's own admission that the 6½ per cent rate of return allowed on the amount included in the rate base for transmission properties is also inadequate. **Moreover, on its rate base, two-thirds of which represents production and gathering properties even on the Commission's theory of original cost, Canadian has been grossly wronged by the Commission in its allowance of an over-all rate of return of 6½ per cent, because the Commission has simultaneously allowed Colorado Interstate (No. 379, this Term), and Colorado-Wyoming Gas Company (No. 575, this Term), a 6½ per cent rate of return on their entire rate bases, and neither of such companies owns any gas producing or gathering properties whatsoever.**

6. The Commission states on page 35 of its brief that the original cost theory adopted by the Commission is "fair alike to consumers and natural-gas companies".

In our opening brief we believe we have demonstrated that the inclusion of natural gas leaseholds in a rate base at their original cost (which to the Commission in this case means the original "wild-cat" acquisition cost twenty to thirty years ago to oil-seeking predecessors) cannot possibly, except by accident, result in fair and reasonable rates either to the consumers or the natural gas companies or other owners of the production. We do not deem it necessary to repeat our demonstration of this truth here.

In the *Panhandle Eastern* case (No. 296, this Term), the Commission admits that when a transmission company purchases the gas which it transports, the Commission uniformly has allowed the purchase price of the gas so purchased as an expense item without question. No satisfactory answer is given as to why the commodity value of the gas at the well-head or at the end of the gathering system could not be used in the instances where the owner of the transmission system is also the owner of the production and gathering properties, if it is proper to use that commodity value where the gas is purchased. Obviously, there can be no rational answer to this question.

Of course, we are not contending that the Commission, whether the gas is purchased from a third person or is produced by the owner of the transmission system, should not have the right to test the price which is claimed to be the going commodity value. We think it perfectly proper for the Commission to test the claimed commodity value in any way it wants, if there is any reason to suspect that the claimed value is not the true commodity value. It can test this claimed commodity value by the use of any method which may be thought to have a legitimate bearing on the facts. But to discard commodity value entirely in favor of a value based upon the Commission's conception of original cost, as we have pointed out in our opening brief, cannot possibly result in just and reasonable rates from the viewpoint of either the consumer or the owner of the gas.

If the Commission's rate reduction order in this case is permitted to stand, based as it is upon an application of the Commission's original cost theory, Canadian will be receiving only approximately 2.1 cents per MCF for its gas at the wellhead as against not less than a 4-cent per MCF commodity market value. (R., V. 6, 3255-3281.) Surely, there can be no justification for this discrepancy. It is discriminatory as between gas which may be transported through a transmission system owned by the producer of the gas, as against gas which may be sold by the producer of the gas to

a third party owner of the transmission system. Such a plan must necessarily result in different prices to different consumers for the same gas produced from the same field and even from the same lease, depending upon whether such consumer is purchasing from one who produces the gas or from one who buys it from the producer.

The Commission seeks to find support for its use of original cost in lieu of commodity value in the opinion or opinions of this Court in the *Hope* case. No support for the Commission, we submit, can be found in the *Hope* case. We have discussed the *Hope* decision in connection with Question 1. The first answer is that this question was not involved in the *Hope* case. All that the *Hope* case does, even in the majority opinion, is to rule that the Commission is not bound to any particular formula. Moreover, when this Court said that the Commission was not bound to the use of any particular formula, it coupled that statement with the qualification that the formula to be adopted must be just and reasonable under the circumstances of the case. That is all we are asking for here. Clearly, the Act contains no mandate that the Commission shall not use commodity value instead of original cost. This is evident from the language of the Act and also from the administrative practice of the Commission in using the commodity value where the gas is purchased.

Our position is that the use of original cost in determining the value of the gas leaseholds as against the use of commodity price of the gas cannot result in just or reasonable rates, which is the very purpose of the Act, and cannot be sustained by recourse to any "end result" or "rate impact" principle, either from the viewpoint of the owner of the gas or the consuming public.

Finally, we submit that under the facts disclosed by the Record in this case, the use of original cost for the inclusion of Canadian's gas leaseholds in the rate base and on the Commission's conception of original cost was an arbitrary and capricious exercise of any general discretionary power

which the Commission may have, and for this reason, if for no other, violates the due process clause of the Fifth Amendment to the Constitution of the United States.

QUESTION 3.

Canadian's Actual Original Cost of Leasehold Properties.

The Commission takes the position in its brief (pp. 37-53) that the full $5,000,000 paid in cash by Canadian to Amarillo for the latter's gas leaseholds, rights and wells at the inception of the Denver Project in 1927-28 should not be considered or allowed in determining Canadian's original cost for rate base purposes, because

(1) Either the transaction which resulted in the acquisition of such properties was simply an intercompany arrangement between two wholly-owned subsidiaries of Southwestern; or

(2) There was a pooling of interests as in the *Niagara* case (135 F. (2d) 787), and Southwestern was in reality merely advanced or loaned $5,000,000 on its future profits from Colorado Interstate.

The Record does not support either of the above alternative assumptions. The formal transfer of properties was ultimately between two wholly-owned subsidiaries of Southwestern, but the basis for that transfer, and the agreement to buy and sell, as well as the consideration to be paid, had its genesis in the original project agreement between three

non-affiliated parties. The terms of such sale and the consideration to be paid were agreed upon as a result of prolonged arm's-length bargaining between Southwestern, as a representative of Amarillo, on the one hand, and Cities Service and Standard, on the other. There was every incentive on the part of Standard and Cities Service to fix the consideration at the lowest possible figure, while on the other hand there was every incentive on the part of Southwestern to secure the greatest possible sum for the properties in question. Thus this transaction was something more than an intercompany arrangement between two subsidiaries of the same parent. The consideration actually paid in cash for such properties resulted from negotiations that absolutely guaranteed a fair price, from the standpoint of public and every other interest. (See Canadian's brief, pp. 52-72.) This being true, there is no occasion here to apply the "no profits between affiliates" rule. It is fundamental that where the reason for a rule fails, the rule itself will not be applied.

The Record in this case establishes without dispute the following:

1. There was an actual purchase and sale of gas leaseholds, rights and wells which was a condition precedent to the establishment of the Denver Project. There would have been no Denver Project unless such production properties had been acquired from Amarillo.

2. The $5,000,000 paid in cash to Amarillo by Canadian for such properties was not an advance or loan of a portion of Southwestern's share of future profits in any joint enterprise, because:

(a) The project agreement between the parties of April 5, 1927 (Memorandum of Stipulations, Exhibit 1, R., V. 1, 381-400) completely contradicts any such interpretation. This agreement, as well as all other evidence in the Record on the subject, clearly and indisputably proves that the parties agreed that Amarillo should sell its gas leaseholds,

rights and wells to Canadian and should receive $5,000,000 in payment therefor, *provided it was able to clear its titles to the satisfaction of the project participants.* (R., V. 5, 2914-2915).

(b) With respect to the Commission's "advance" theory (Com. Br., 42), or the "loan" theory (Com Br., 52), an advance or loan carries with it a definite offsetting liability to repay the sum advanced or loaned. This is true in any parlance,—legal, accounting, commercial, or otherwise. Neither Southwestern nor Amarillo had any such liability in this case. The money paid belonged irretrievably to Amarillo, with the unrestricted right to keep and utilize the same for any purpose or purposes it might see fit.

(c) If the Project had failed entirely, or had become hopelessly insolvent, still Amarillo would have retained as its own the full $5,000,000 paid, without any obligation whatsoever on the part of Amarillo or Southwestern to repay.

(d) If we assume *arguendo* that the $5,000,000 did constitute an advance or loan on future profits of Colorado Interstate, then only 42½ per cent of such profits could be deducted from profits accruing to Southwestern (after payment of dividends on the outstanding preferred stock), because Southwestern owned only 42½ per cent of the common stock of Colorado Interstate. If this sum was to be repaid out of profits of Colorado Interstate, then it is obvious that the remaining 57½ per cent would have to be repaid from the profits of the other non-affiliated stockholders of Colorado Interstate.

(e) The fact that Canadian paid the purchase price for the gas leaseholds, rights and wells acquired from Amarillo out of the proceeds of its first mortgage bond issue is of no material significance. Canadian financed its investment in pipelines, compressor stations, gathering lines, additional wells drilled and additional leaseholds, in exactly the same manner. The Commission has generally recognized that

rate bases are founded upon actual dollars invested in property without regard to the source of such dollars, whether it be sale of stock, issuance of bonds or a bank loan, or cash on hand from any other source.

If we take the most extreme position advanced by the Commission, and assume *arguendo* that there was a pooling of assets beginning with the acquisition of such properties by Canadian, still the fact remains that $5,000,000 was paid in cash by Canadian to Amarillo for such properties. The money went *out of*, not *into*, the Project picture. **The payment did not represent the taking of money out of one pocket of Southwestern and placing it in another, as is often true in transactions between affiliates. The money came from sources entirely outside of the Southwestern holding company system. Amarillo received and retained $5,000,000 of new, outside money for its properties.** This money was clearly invested by Canadian for the properties acquired from Amarillo, and the acquisition of such properties was a condition precedent to the establishment of the entire Denver Project. It necessarily follows, therefore, however the transaction may be viewed, that this entire $5,000,000 must be considered under the facts in this case as a part of the original cost of Canadian.

Commission's "advance" or "loan" argument implies that Southwestern, as the parent of Amarillo, received 42½ per cent of the common stock and 50 per cent of the preferred stock of Colorado Interstate as full and complete consideration for the transfer of the gas leaseholds, rights and wells by Amarillo to Canadian. The fact still remains, however, that Southwestern received not only the stock interest above referred to, but that in addition thereto its subsidiary, Amarillo, received without any strings whatsoever $5,000,000 in cash. If this $5,000,000 had not been paid to Amarillo, then, on the theory of the Commission, Southwestern's stock ownership in Colorado Interstate would have been very much greater. In other words, the $5,000,000 would be an actual cash consideration over and

above any participation which Southwestern might have in any profits made by Colorado Interstate. The Record is quite clear that Southwestern's interest in Colorado Interstate was acquired in consideration of the contract between Canadian and Colorado Interstate whereby Canadian agreed to sell gas to the latter at actual cost, not only for the primary term of twenty years, *but as long thereafter as Colorado Interstate elected to purchase gas.* Canadian obligated itself under this Cost Contract to perform many other very definite and very onerous obligations. (See Canadian's opening brief, pp. 11-13.)

If we should go all the way with the Commission in its theoretical interpretation of this transaction, and assume for the purposes of argument that the situation would have been no different had Amarillo in the first instance entered into a contract, in consideration of a cash payment of $5,000,000, to sell gas to Colorado Interstate at cost so long as Colorado Interstate elected to purchase the same on that basis, then certainly it would have been necessary in this case to have reflected the full cost of such contract in the rate base of Colorado Interstate. In that event the net result for the project as a whole would have been exactly the same, as is contended for here by Canadian. In other words, since Colorado Interstate reimburses Canadian for its actual cost of producing gas, including amortization of its indebtedness, it makes no difference to the Project as a whole whether the $5,000,000 is in the rate base of Colorado Interstate or in the rate base of Canadian. **The important thing is that the Project participants have invested $5,000,000 in gas leaseholds, rights and wells for the future use of the customers of the Denver Project, and at some point they are certainly entitled to a return on such investment.**

Commission's brief, in footnote 18, page 42, intimates that only a small proportion of the $5,000,000 was actually paid to Amarillo. This assumption is based upon only a portion of the testimony of Commission staff witness Luttring.

Luttring himself clearly refutes any such assumption. He stated in this connection that his testimony with respect to the disposition of such funds was misunderstood. He said he merely desired to show that the funds were handled in the first instance by Prairie Oil and Gas Company probably due to the fact that it was a responsible person and neither Canadian nor Colorado Interstate then had banking facilities. In fact, Canadian was not then organized. Notwithstanding the Commission's characterization of the profit realized by Amarillo on the $5,000,000 transaction as "paid-in-surplus", Commission witness Luttring testified that such profit was paid out by it as a dividend to its stockholders (Southwestern), and *that the entire sum of $5,000,000 was paid to and received by Amarillo.* (R., V. 5, 2938.) The Commission also made a finding to the same effect. (R., V. 1, 150.)

The Commission predicates its entire argument not on the Record, but on the "pooling of assets" theory advanced in a decision by the Second Circuit Court in the case of *Niagara Falls Power Company* v. *Federal Power Commission*, 135 F. (2d) 787. This case is in no sense controlling here, either in principle or otherwise, for the reasons heretofore given and in addition thereto the following:

(1) Niagara Falls Power Company was a licensee of the Government under the Federal Power Act, and as a licensee was required to keep its books in the manner prescribed by the statute. The Act provided that the Government might recapture the properties at original cost at the end of the period of the license. Section 23(a), 16 U. S. C. A., Sec. 816, of the Act further provided, however, that where a licensee had an indefeasible right to divert water from an interstate or international navigable stream at the time the license was issued by the Federal Power Commission (which in this case was in 1921), then the licensee would be entitled to set up on its books under the recapture clause the "present fair value" of its properties at that time. This was the primary issue involved in the *Niagara* case.

The Court found that Niagara did not have a vested right to divert water from the Niagara River at the time the license was issued, and therefore its accounts were governed entirely by other provisions of the Act, which stated in detail just how the original cost was to be reflected. We, of course, have no such provision in the Natural Gas Act, and no similar situation is therefore presented in the case at bar.

(2) There was also involved in the *Niagara* case the question as to whether a sale had been made. The Court held there that a sale had not been made, but that the transaction represented merely the pooling of the assets of two companies, and that each of the original companies thereafter owned a proportionate interest in the combined assets. No money whatsoever changed hands. In this case, $5,000,000 in cash changed hands, which funds went *out of* the Project, —not *into* the Project. This fact, within itself, clearly distinguishes this case from the *Niagara* case.

(3) In the *Niagara* case the new company acquired all of the assets and business of the old companies, and continued to operate the identical properties for the identical purposes that they had theretofore been operated. In this case, Canadian acquired the properties from Amarillo for the purpose of engaging primarily in an entirely new and distinct undertaking—one in which Amarillo had not theretofore engaged,—the production of gas to be ultimately transported in interstate commerce.

(4) The Court in its opinion in the *Niagara* case very frankly admitted that many of the principles announced there "may be inapplicable to unlicensed public utilities." This is necessarily true, because it was there dealing with a statutory definition of original cost as applicable to licensees under the Federal Power Act. Such statutory requirement could have no application to an unlicensed utility, and certainly could have no application to producing and gathering properties of Canadian in this case, where

the Act itself specifically withholds jurisdiction from the Commission.

(5) But above all, in the *Niagara* case no cash whatsoever changed hands. There was no sale. In this case there most certainly was a sale, or, if we take the most extreme theory advanced by the Commission, there was a definite dedication of valuable gas leasehold properties to the Denver Project for which the sum of $5,000,000 in cash was paid. Such sum, in any event, became a part of the actual and legitimate original cost of the Project, whether viewed as an outright purchase of property or whether viewed as the acquisition of certain rights in property by way of dedication, irrevocably and perpetually, for the future use of the Denver Project.

(6) The corporate consolidation in the *Niagara* case resulted from an enabling act passed by the Legislature of the State of New York, which act provided that the capitalization of the new company should not exceed the cost carried on the books of the old companies. The Court held that for this reason there could be no desire on the part of either of the original companies to reduce the capitalization below this amount, and in effect held, therefore, that the basic elements normally present in arm's-length transactions were absent in the *Niagara* case. Certainly the Record here amply proves that there was intense arm's-length bargaining for the purpose of fixing the consideration to be paid by Canadian to Amarillo for the latter's gas leaseholds, rights and wells.

The criticism by Commission counsel of the *A. T. & T.* and *New York Telephone* cases (Com. Br., 45) is without merit. It is true that those cases had reference to accounting problems, but even so, the underlying principles there announced are even more vital in cases where a rate base is being determined. It is also true that those cases do not aid in determining whether Canadian invested $5,000,000 in the properties acquired from Amarillo, *but that fact is*

undisputed on the Record. The Commission found that Canadian actually paid Amarillo $5,000,000 in cash for the latter's gas leaseholds, rights and wells (R., V. 1, 150). Luttring, Commission staff witness, also testified to this fact, as shown by the following quotation from the Record:

> "Q. * * * Ultimately the Amarillo Oil Company received by way of credits or otherwise the full amount of the purchase price of $5,000,000?
>
> "A. Yes." (R., V. 5, 2938.)

In view of the above, the only issue is whether this investment should be recognized. On this issue, the *A. T. & T.* case is directly in point. (See Canadian's brief, pp. 66-67.)

There is no justification in any event for inclusion of properties in a rate base upon a prudent investment or original cost theory, except upon the basis advanced by Mr. Justice Brandeis in the decisions of this Court. Mr. Justice Brandeis has said that prudent investment is the money invested *to establish the utility.* We submit that such theory, as developed and applied by the Commission, has no application to the properties, business and operations of Amarillo Oil Company, whose costs have been used in this case for rate base purposes of Canadian.

Amarillo's original acquisition of gas leaseholds and its drilling of exploratory wells was a mining operation in search of oil. The expenditures made in this venture did not constitute an investment in a utility, and no utility or public service status could have attached thereto. The great value of Amarillo's leasehold properties resulted from the discovery of natural gas, which discovery necessarily and inevitably preceded any character of public service operation. Since Amarillo invested no money in a utility enterprise, the prudent investment theory, as developed and expounded by Mr. Justice Brandeis, has no possible application whatsoever.

The very first time that even a semblance of a public service status could be said to have attached to the pro-

during leaseholds and property of Amarillo was when they were acquired by Canadian from Amarillo for the Denver Project. This, therefore, was likewise the very earliest date upon which the prudent investment theory of Mr. Justice Brandeis could have been applied. It follows, therefore, that since the original cost or prudent investment theory is definitely inapplicable to the costs of Amarillo, the Commission is bound to allow Canadian the full $5,000,000 in cash which it paid for and invested in its gas leaseholds, rights and wells.

QUESTION 8.

Allocation.

In its opening brief (pp. 72-88) Petitioner has set forth its position on the subject of allocation and its application to the facts in this case, and it is unnecessary here to repeat the views there expressed. We submit, however, that the Commission in its brief (pp. 54-88) has made no valid answer to Petitioner's contentions.

The Commission has entered a separate and individual rate order against Canadian. Such separate and individual order is based upon an allocation which takes into consideration not the properties, revenues and expenses of Canadian, but the properties, revenues and expenses of Canadian and Colorado Interstate combined into a hypothetical composite system. If an individual and separate rate order is to be applied against Canadian, then Canadian is entitled to have that order based upon its separate and individual properties, revenues and expenses. This the Commission admittedly did not do. The properties, revenues and expenses of Colorado Interstate, or any other company, have no relevancy, competency or materiality in determining the extent or nature of the order directed to Canadian. This fundamental proposition, which is true from every standpoint, legal or otherwise, was totally ignored by the Commission, and the Commission in its brief makes no attempt to give an effective answer thereto.

There are many patent infirmities and impossibilities which grow out of the application of a composite system allocation against an individual member of the assumed composite system. It is deemed unnecessary to mention all of them here. Canadian owns and operates that part of the assumed composite system extending from the field to Clayton Junction, and Colorado Interstate owns and operates the balance of such composite system extending from Clayton Junction to Denver. It should be obvious that to combine both companies and to allocate such cost on a uniform volume basis, without regard to the distance the gas is transported, necessarily requires Canadian's intrastate customers adjacent to the field and its other non-regulable business to bear a portion of Colorado Interstate's long haul costs. For example, a total of more than $141,000 was allocated to Canadian's producing and gathering operations for federal income tax purposes, whereas the total amount allowed by the Commission in Canadian's annual expenses for such taxes was only $66,000. **Obviously, Canadian was required to absorb about $75,000 of the federal income taxes of Colorado Interstate in this composite allocation. No "end result" can be just and reasonable when this occurs.**

As heretofore stated in Petitioner's opening brief (pp. 81-83), there is absolutely no evidence in the Record upon which to base any rate reduction order directed to the sale made by Canadian to Colorado Interstate at Clayton Junction. The Commission's witness testifying on the subject of allocation (whose theories have been adopted by the Commission) totally ignored this sale. This action necessarily followed when he decided to make his allocation on the basis of the combined properties, revenues and expenses of the two companies rather than upon their individual properties, revenues and expenses. Upon consolidation into a composite system, this sale and all other transactions between the two companies were automatically eliminated. Again, as pointed out in our opening brief, when it became necessary for the Commission to find the cost of gas to Colo-

rado Interstate for the purposes of its rate reduction order against Canadian, it used a "plugged" figure which has no basis whatsoever in the Record.

Commission counsel attempt to supply this deficiency by attaching certain exhibits to their brief which purport to show what the Commission did in arriving at its ultimate conclusions with respect to allocation of cost of service. These exhibits were never introduced in evidence, and certainly cannot be substituted at this late date to supply flagrant omissions in the Commission's Opinion and rate reduction order. But even if such exhibits were given the force and effect of evidence or findings, we submit to the Court that it is still impossible to determine therefrom what the Commission did. Finally, the exhibits do show clearly that the adjustments made by the Commission were adjustments against a composite system of allocation (not the individual properties, revenues and expenses of Canadian), and that there still is no evidence in the Record or in the Commission's brief as to the allocated cost of service for the sale made by Canadian to Colorado Interstate. Consequently there still is no foundation in the Record or in Commission's brief upon which to base a separate rate reduction order against Canadian in connection with its sale to Colorado Interstate.

The sales made by Canadian to Colorado Interstate for resale to Colorado Fuel & Iron and other such direct sales are not subject to the jurisdiction of the Commission. The legislative history referred to and quoted from in the Commission's brief (pp. 80, *et seq.*) does not support its contention, but does directly support our contention. The purpose was to cover wholesale sales even though they were sales from one company to another "before the gas is finally sold *to the public.*" (Italics ours.)

As stated by Mr. Benton, commenting on the amendment as adopted (Com. Br., 83), "The language of the suggested amendment just proposed leaves this purpose unaffected, and makes clear that the regulation of intercompany sales

is designed for the protection of the *consuming public*, as a part of the complete regulation of the entire *utility service.*" (Italics ours.) The Colorado Fuel & Iron Company and other such direct sale customers for industrial fuel purposes are not a part of the "consuming public," nor are they a part of a "utility service." Such service was not declared to be "affected with a public interest." Only the business of "transporting and selling natural gas *for ultimate distribution to the public*" was declared by the Act to be effected with a public interest, and such direct sales for consumption are by the Act expressly exempted from regulation. Why should the price of this gas sold by Petitioner to Colorado Interstate be regulated any more than the ultimate sale by Colorado Interstate to the Colorado Fuel & Iron Company? How can there be a "public interest" or a "public utility service" or "ultimate public consumption" in the one case and not in the other?

For the sake of brevity, and to avoid duplication, Petitioner adopts here what Colorado Interstate has said in its reply brief (No. 379, this Term), in so far as the principles and law therein stated are applicable to the case of Canadian.

CONCLUSION.

We respectfully submit that the brief submitted in behalf of the Respondents utterly fails to answer any of our arguments submitted in our opening brief in support of the four questions presented. No reliance may properly be placed by the Commission upon the so-called "end result" doctrine of the *Hope* case, inasmuch as it is fundamental that the jurisdiction of the Commission over the subject attempted to be regulated must be definitely established before any such "end result" principle may in any event be applied.

We therefore renew our prayer that this case be remanded, with instructions to vacate, set aside and enjoin the Order of the Commission.

Respectfully submitted,

No. 380.

CANADIAN RIVER GAS COMPANY, a Corporation, *Petitioner*

v.

FEDERAL POWER COMMISSION, CITY AND COUNTY OF DENVER, COLORADO, PUBLIC SERVICE COMMISSION OF WYOMING, COLORADO-WYOMING GAS COMPANY, PUBLIC SERVICE COMPANY OF COLORADO, AND COLORADO INTERSTATE GAS COMPANY, *Respondents.*

BRIEF OF THE INDEPENDENT NATURAL GAS ASSOCIATION OF AMERICA, AMICUS CURIAE.

This brief of the Independent Natural Gas Association of America is presented *amicus curiae*, under Rule 27, paragraph 9, of the Rules of this court.

OPINIONS BELOW.

The opinion of the Circuit Court of Appeals for the Tenth Circuit in this proceeding is reported in 142 F. (2d) 943. The opinion and order of the Federal Power Commission is reported in 43 P.U.R. (N.S.) 205.

JURISDICTION.

Jurisdiction of this Court is invoked by the Petitioner under Section 240(a) of the Judicial Code, as amended by the Act of February 13, 1925, and Section 19(b) of the Natural Gas Act. (Pet. for Cert., p. 2).

PRELIMINARY STATEMENT.

The Independent Natural Gas Association of America is a corporation organized and existing under the laws of the state of Delaware. The membership of the Association consists of persons and corporations engaged in the production, gathering, transportation and sale of natural gas, and includes a number of royalty owners. Under the Association's charter, one of its principal purposes is to "promote and advance the welfare, progress and development of the natural gas industry in the United States of America and particularly to protect the interests of the producers of natural gas." In respect to regulation of the production and gathering of natural gas, the Board of Directors of the Association, at a meeting held in Tulsa, Oklahoma, on August 1, 1944, adopted the following resolution:

> "Resolved, That it is the definite opinion of the Independent Natural Gas Association of America that the regulation of the production, gathering and conservation of natural gas is the function of the respective producing states, and not of any Federal agency."

The Association, accordingly, has a direct and immediate interest in the instant proceeding, especially in respect to the question whether the Federal Power Commission exceeded the jurisdiction vested in it by the Natural Gas Act when it asserted and exercised authority over the production and gathering facilities of the Canadian River Gas Company. The precedent to be established in this case is of great significance and importance to the natural gas industry as a whole.

STATEMENT OF THE CASE.

This proceeding involves the validity of an order of the Federal Power Commission (hereinafter referred to as the Commission), adopted on March 18, 1942, reducing rates for the transportation and sale of natural gas by the Canadian River Gas Company (hereinafter referred to as Canadian). Canadian obtained a review of this order of the Commission by the United States Circuit Court of Appeals for the Tenth Circuit. That Court affirmed the order of the Commission in a judgment entered on July 8, 1944. A petition for Certiorari was filed with this Court by Canadian on August 22, 1944. On November 13, 1944, this Court granted said petition, but limited its review to Question No. 8, relating to the validity of the Commission's action in respect to the separation or allocation of properties. Canadian filed a petition for rehearing and enlargement of the scope of review on December 4, 1944, and this Court, by order entered on January 2, 1945, broadened the scope of review to include Questions Nos. 1, 2, and 3. Question No. 1, in which the Independent Natural Gas Association of America is particularly interested, reads as follows:

> "1. Whether the Circuit Court, after correctly holding that the Commission has no rate regulatory jurisdiction over Canadian's production and gathering properties, facilities and business, erroneously concluded and ruled that the Commission in this case did not exercise such prohibited jurisdiction."

Canadian is engaged in the production, gathering, transportation and sale of natural gas. Natural gas is produced from its leaseholds in the Panhandle (Texas) Gas Field. A portion of the gas so produced goes into Canadian's gathering or field system which terminates at Bivins Station, Texas. After compression at Bivins Station, the gas is transported, for a distance of approximately 86 miles through a main 22 inch transmission line to Clayton Junction, New

Mexico, where it is sold and delivered to the Colorado Interstate Gas Company for ultimate consumption in the State of Colorado. The remainer of the gathered gas produced by Canadian in the Panhandle Gas Field goes into Canadian's gathering or field system which terminates at Fritch Station, in Texas. After compression at Fritch Station, the gas is then transported by Canadian, through facilities leased from Texoma Natural Gas Company, to Gray Junction, Oklahoma, where the gas is sold to the Colorado Interstate Gas Company. (R., V. 1, p. 143). Canadian also sells gas to the Amarillo Oil Company, at the wells in the field, for ultimate distribution in the cities of Amarillo and Channing, Texas, and along the route of its pipeline for ultimate distribution in Dellart, Hartley and Texline, Texas, and in Clayton, New Mexico (R., V. 2, p. 708).

It is an established fact, which was clearly recognized by the Commission in its opinion in this proceeding, that Canadian's operations may readily be classified as between the production, the gathering, the transportation and the sale of natural gas. Nevertheless, the Commission made no distinction between these different functions performed by Canadian. Instead, the Commission grouped all of the functions together, and, for the purpose of its rate reduction order, determined rate base, revenues, expenses and rate of return on all of Canadian's operations, on the premise that production and gathering constituted an "integral" part of Canadian's operations and therefore should be treated in the same manner as facilities used for the transportation and sale of natural gas in interstate commerce (R., Vol. 1, p. 143, 146).

STATUTE INVOLVED.

The pertinent provisions of the Natural Gas Act (52 Stat. 821; 15 U.S.C. 717) are printed in Appendix A of this brief.

QUESTION PRESENTED.

The primary question to be argued in this brief is Question No. 1 of Canadian's petition for a writ of certiorari herein, namely, whether the Circuit Court of Appeals, after correctly holding that the Commission has no rate regulatory jurisdiction over Canadian's production and gathering properties, facilities and business, erroneously concluded and ruled that the Commission in this case did not exercise such prohibited jurisdiction. Incidental to this question, we will consider the adverse effect of the exercise of jurisdiction by the Commission over production and gathering upon the field operations of companies engaged in the natural gas business.

ARGUMENT.

I. Production and Gathering of Natural Gas Are Specifically Exempted from the Jurisdiction of the Commission Under the Provisions of the Natural Gas Act

When Congress enacted the Natural Gas Act of June 21, 1938 (52 Stat. 821, 15 U.S.C. 717), it did not vest the Federal Power Commission with full and complete jurisdiction over the natural gas industry. On the contrary, limitations upon the jurisdiction of the Commission were specifically set forth in the very first section of the Act, which reads as follows:

> "(a) As disclosed in reports of the Federal Trade Commission made pursuant to S. Res. 83 (Seventieth Congress, first session) and other reports made pursuant to the authority of Congress, it is hereby declared that the business of transporting and selling natural gas for ultimate distribution to the public is affected with a public interest, and that Federal regulation in matters relating to the transportation of natural gas and the sale thereof in interstate and foreign commerce is necessary in the public interest.
>
> "(b) The provisions of this Act shall apply to the transportation of natural gas in interstate commerce, to the sale in interstate commerce of natural gas for

resale for ultimate public consumption for domestic, commercial, industrial, or any other use, and to natural-gas companies engaged in such transportation or sale, *but shall not apply* to any other transportation or sale of natural gas or to the local distribution of natural gas or to the facilities used for such distribution or *to the production or gathering of natural gas.*"

It is obvious that the provisions of the Act were thus made applicable only to the *transportation* of natural gas in interstate commerce and to the *sale* in interstate commerce of natural gas for *resale* for ultimate public consumption. The provisions of the Act specifically do *not* apply (1) to any other transportation or sale of natural gas, (2) to the local distribution of natural gas or to the facilities used for such distribution or (3) to the production or gathering of natural gas. No language could possibly be plainer as to the limitations which Congress desired to place and did place, upon the Commission's authority under the Natural Gas Act.

When it enacted that statute, therefore, Congress was careful to confine and limit the jurisdiction of the Commission to the particular transportation or sale of natural gas intended to be covered by the provisions of the Act. Production and gathering were explicitly excluded.

Sec. 2(6) defines a "natural-gas company" to mean "a person engaged in the transportation of natural gas in interstate commerce, or the sale in interstate commerce of such gas for resale." Sec. 4 and 5(a), which are the rate regulatory provisions of the Act, refer to charges for the "transportation or sale of natural gas subject to the jurisdiction of the Commission." Sec. 7(a) relates to the extension or improvement of "transportation" facilities. Sec. 7(b) refers to the abondonment of "facilities subject to the jurisdiction of the Commission." Sec. 7(c)[1] covers the construction or extension of facilities for "the transporta-

[1]This section was amended by the Act of February 7, 1942, c. 49 (56 Stat. 83).

tion or sale of natural gas, subject to the jurisdiction of the Commission."

Aside from its use in the exemption provision in Sec. 1(b), the word "production" appears only in Sec. 5(b), 9(a), 10(a) and 11(a) of the Act. Sec. 5(b) provides that the Commission, upon its own motion, or upon the request of any State commission, whenever it can do so without prejudice to the efficient and proper conduct of its affairs "may investigate and determine the cost of the production or transportation of natural gas by a natural-gas company in cases where the Commission has no authority to establish a rate governing the transportation or sale of such natural gas." This provision obviously has for its sole purpose the aiding of State regulation, and vests no authority in the Commission to exercise direct jurisdiction over the production activities of a natural-gas company. As a matter of fact, the legislative history of this subsection fully corroborates the view that Congress did not intend to give the Commission any such direct jurisdiction over the production activities of a natural gas company.[1] The Commission

[1]Commenting upon this section in its report on the legislation, the House Committee stated that it "will greatly aid State commissions in their rate-making proceedings." (H. Rep. No. 709, 75th Cong., 1st Sess. on H. R. 6586). This subsection, in the form in which it appeared in H. R. 4008 (75th Cong., 1st Sess.), did not contain the limiting language "by a natural-gas company." Objection thereto was registered by Congressman Boren of Oklahoma and Chairman Maltbie of the New York Public Service Commission on the ground that the subsection constituted an extension of authority into the State field (Hearings on H. R. 4008, 75th Congress, 1st Sess., pages 46, 106-110, 147). When the bill reached the House for debate, Congressman Boren offered an amendment, which was adopted, inserting the qualifying words "by a natural-gas company." Congressman Boren stated that it was the purpose of the amendment "to keep the jurisdiction of the Federal Government as clearly defined as possible from the jurisdiction of the State government in cases arising under the provisions of the bill" and that the amendment "assures us that the Federal Government will not go into a realm where the State government already has proper authority to handle the problem." (Cong. Rec. 75th Cong., 1st Sess., Vol. 81, Part 6, page 6728).

has itself construed this provision as designed to aid State and local regulation. *Re The East Ohio Gas Company*, 28 P.U.R. (N.S.) 129; 115 F. (2d) 385.

Sec. 9(a) of the Act authorizes the Commission to determine, and by order fix, proper and adequate rates of depreciation and amortization in respect to the several classes of property of each natural-gas company used or useful in the "production, transportation, or sale of natural gas." This section, however, contains a proviso to the effect that

> "Nothing in this section shall limit the power of a State commission to determine in the exercise of its jurisdiction, with respect to any natural-gas company, the percentage rates of depreciation or amortization to be allowed, as to any class of property of such natural-gas company, or the composite depreciation or amortization rate, for the purpose of determining rates or charges."

In other words, what Congress did in sec. 9(a) of the Act was to vest the Commission with jurisdiction to determine depreciation and amortization rates of natural-gas companies, but at the same time it expressily recognized the right of State authorities to determine such depreciation and amortization rates, even in respect to a "natural-gas company" (defined in the Act to be a person engaged in the transportation of natural gas in interstate commerce, or the sale in interstate commerce of such gas for resale). This is another example of the scrupulous care which Congress exercised, when it enacted the Natural Gas Act, not in any way to interfere with the authority of the States in the respects in which they were considered authorized to act, even when interstate commerce might be involved, namely, in the fields of distribution, production, and gathering of natural gas.

In any event, the mention of "production" in Sec. 9(a) in respect to the determination of depreciation and amortization charges, may not properly be used as a predicate for

the assertion of jurisdiction by the Commission over the production of natural gas, in the manner in which it exercised such jurisdiction in the proceeding under review. Determination and prescription of depreciation and amortization charges are primarily accounting problems, and may be considered separate and apart from the fixation of just and reasonable rates to be charged for public utility or transportation services. *Northwestern Bell Telephone Company* v. *Nebraska State Railway Commission*, 297 U.S. 471; *American Telephone and Telegraph Company* v. *United States*, 299 U.S. 232. Thus, under a statutory provision analogous to Section 9(a) of the Natural Gas Act, namely, Section 20(5) of the Interstate Commerce Act (41 Stat. 493), the Interstate Commerce Commission considered the determination and prescription of depreciation charges for telephone companies without regard to the use thereof in rate proceedings. *Depreciation Charges for Telephone Companies*, 177 I.C.C. 351.

Section 10(a) of the Act authorizes the Commission to require natural-gas companies to file periodic or special reports, including, among other things, "full information as to assets and liabilities, capitalization, investment and reduction thereof, gross receipts, interest due and paid, depreciation, amortization, and other reserves, cost of facilities, cost of maintenance and operation of facilities for the *production*, transportation, or sale of natural gas, cost of renewal and replacement of such facilities, transportation, delivery, use, and sale of natural gas." The mere inclusion in this subsection of the power to require information in respect to facilities used in the "production" of natural gas (when such "production" was specifically excluded from the Commission's jurisdiction by Section 1(b), obviously cannot be deemed in any manner to vest the Commission with a jurisdiction over production activities which has already been specifically excluded. This Court has repeatedly held that a regulatory body may require information from a regulated company with respect to all of its operations, even

though a portion of such operations may not be subject to regulation by the tribunal requiring the information. *Arkansas Louisiana Gas Company* v. *Department of Public Utilities*, 304 U.S. 61; *Natural Gas Pipeline Company of America* v. *Slattery*, 302 U.S. 300; *Interstate Commerce Commission* v. *Goodrich Transit Company*, 224 U.S. 194. In the last cited case, the court declared:

> "It is a mistake to suppose that the requiring of information concerning the business methods of such corporations, as shown in its accounts, is a regulation of business not within the jurisdiction of the Commission, as seems to be argued. The object of requiring such accounts to be kept in a uniform way, and to be open to the inspection of the Commission, is *not to enable it to regulate the affairs of the corporations not within its jurisdiction*, but to be informed concerning the business methods of the corporations subject to the act, that it may properly regulate such matters as are really within its jurisdiction."

In Section 11(a) of the Natural Gas Act it is provided that in case two or more states propose to the Congress compacts dealing with the "conservation, production, transportation, or distribution of natural gas," it shall be the duty of the Commission to assemble pertinent information relative thereto, to make public and to report to the Congress information so obtained, together with such recommendations for further legislation as may appear to be appropriate or necessary to carry out the purposes of such compact and to aid in the conservation of natural gas resources within the United States and in the orderly, equitable, and economic production, transportation, and distribution of natural gas.

It is obvious that Section 11(a) vests in the Commission no jurisdiction over the production of natural gas other than the power to investigate state compacts, to report them to Congress, and to make recommendations for further legislation. By no stretch of the imagination could this subsection

be construed as vesting in the Commission any power over production of natural gas such as was essayed to be exercised in the instant proceeding. This Court, in *Federal Power Commission* v. *Hope Natural Gas Company*, 320 U.S. 591, 613, commented that, by Section 11(a) of the Act, "Congress recognized the legitimate interests of the states in the conservation of natural gas," and added that "Congress was quite aware of the interests of the producing states in their natural gas supplies."

The only other provision of the Natural Gas Act which could in any manner be relied upon to support a contention that the Commission has any authority of any nature over production is Section 14(b), wherein it is provided that the Commission may, after hearing, "determine the adequacy or inadequacy of the gas reserves held or controlled by any natural-gas company, or by anyone on its behalf, including its owned or leased properties or royalty contracts" and that it may also, after hearing, "determine the propriety and reasonableness of the inclusion in operating expenses, capital, or surplus of all delay rentals or other forms of rental or compensation for unoperated lands and leases." The subsection further provides that the Commission, for the purpose of such determination, "may require any natural-gas company to file with the Commission true copies of all its lease and royalty agreements with respect to such gas reserves."

This provision appears in the section of the Act authorizing "investigations" by the Commission, and has no direct application to rate proceedings. Although the subjects covered in this subsection of the Act relate to certain of the field operations of natural-gas companies, it does not follow that Congress, by giving the Commission the power to "investigate" and "determine" such matters intended to expand the jurisdiction of the Commission to include regulation of production and gathering, in relation to rate fixation, and thereby repudiate and nullify the specific and un-

ambiguous exemption language contained in Section 1(b). It is entirely possible for the Commission, in its administration of the Act, to give full effect to the Congressional purpose, as expressed in Section 14(b), without regulating or attempting to regulate the production and gathering of natural gas as it has done in this proceeding. Concededly, the adequacy of the gas reserves available to a natural gas company may be an important factor to be considered in determining the general question of public convenience and necessity involved in the construction, extension or abadonment of facilities or service under Section 7 of the Act. *Re Kansas Pipeline and Gas Company*, 30 P.U.R. (N.S.) 321, 332; *Re Cabot Gas Corporation*, 43 P.U.R. (N.S.) 182, 47 P.U.R. (N.S.) 65, 51 P.U.R. (N.S.) 458. The amount of gas reserves available is also pertinent to the determination of amortization rates under Sec 9(a). Also, the question whether delay rentals should be properly chargeable to operating expense or capital is entirely relevant to a determination of correct accounting pursuant to the authority vested in the Commission in Section 8(a) of the Act to prescribe a system of accounts to be kept by natural-gas companies. The Commission prescribed such a system of accounts, effective January 1, 1940, and provided therein for a special treatment of exploration and development costs, including delay rentals, in the income accounts (Accounts 510-513).

It is apparent from the foregoing review, that neither the provisions of the Act which mention the word "production," nor the provision with respect to gas reserves and delay rentals, may properly be cited or used to sustain an assertion of jurisdiction by the Commission over production and gathering operations in a rate regulatory proceeding such as the instant case. It seems evident that Congress intended to exclude entirely from the Commission's rate jurisdiction "the production and gathering of natural gas," for it excluded such operations by language contained in the same subsection of the Act wherein it specifically defined the

Commission's jurisdiction as covering only the transportation and sale for resale of natural gas in interstate commerce. The language is clear and unequivocal. And the rate regulatory provisions of the Act followed the same pattern, namely, the Commission's jurisdiction was limited to the transportation and sale for resale of natural gas in interstate commerce.

The legislative history of the Natural Gas Act[1] also bears out and fully supports the position that Congress did not intend to vest in the Commission any authority over the production or gathering of natural gas, whether in rate proceedings or otherwise. In its report on the bill which became the Natural Gas Act, the House Committee on Interstate and Foreign Commerce (H. Rep. No. 709, 75th

[1] That the Congress intended to consider the problems peculiarly and particularly incident to regulation of the transportation and sale of natural gas, as a separate and distinct proposition, from regulation of the electric industry, is apparent from the legislative history of the Natural Gas Act. The Federal Trade Commission had made reports on its investigation of electric and gas utilities pursuant to Congressional authorization (Document 92, Parts 72-A and 73-A, 70th Cong., 1st Sess.). Federal regulation of the transportation and sale of natural gas was at first provided for in Title III of the bills (S. 1725 and H. R. 5423, 74th Cong., 1st Sess.) which eventually became the Public Utility Act of 1935 (49 Stat. 803). However, after hearings before the Congressional committees, the provisions relating to the regulation of natural gas were omitted from the bills reported by the Congressional committees (S. 2796, Senate Report No. 621 and H. R. 5423, House Report No. 1318, 74th Cong., 1st Sess.) and S. 2796, which became the Public Utility Act of 1935, did not contain provisions for the regulation of the transportation and sale of natural gas. The Federal Trade Commission submitted its final report on natural gas in December 1935 (Document 92, Part 84-A, 70th Cong., 1st Sess.). Various bills were thereafter introduced to regulate natural gas (S. 4180, H. R. 11662 and H. R. 12680, 74th Cong., 2nd Sess.; S. 1919, H. R. 4008, H. R. 5711 and H. R. 6586, 75th Cong., 1st Sess.). The only bills upon which Congressional hearings were held were H. R. 11662 (74th Cong., 2nd Sess.) and H. R. 4008 (75th Cong., 1st Sess.). H. R. 6586, 75th Cong., 1st Session, became the Natural Gas Act of 1938 (52 Stat. 821).

Cong., 1st Sess.) stated the general purpose of the legislation as follows:

"If enacted, the present bill would for the first time provide for the regulation of natural-gas companies transporting and selling natural gas in interstate commerce. It confers jurisdiction upon the Federal Power Commission over the transportation of natural gas in interstate commerce, and the sale in interstate commerce of natural gas for resale for ultimate public consumption for domestic, commercial, industrial, or any other use. The States have, of course, for many years regulated sales of natural gas to consumers in intrastate transactions. The States have also been able to regulate sales to consumers even though such sales are in interstate commerce, such sales being considered local in character and in the absence of congressional prohibition subject to State regulation. (See *Pennsylvania Gas Co.* v. *Public Service Commission* (1920), 252 U. S. 23.) There is no intention in enacting the present legislation to disturb the States in their exercise of such jurisdiction. However, in the case of sales for resale, or so-called wholesale sales, in interstate commerce (for example, sales by producing companies to distributing companies) the legal situation is different. Such transactions have been considered to be not local in character and, even in the absence of Congressional action, not subject to State regulation. (See *Missouri* v. *Kansas Gas Company* (1924) 265 U. S. 298, and *Public Service Commission* v. *Attleboro Steam & Electric Co.* (1927) 273 U. S. 83.) The basic purpose of the present legislation is to occupy this field in which the Supreme Court has held that the States may not act.

"The bill takes no authority from State commissions, and is so drawn as to complement and in no manner usurp State regulatory authority, and contains provisions for cooperative action with State regulatory bodies.

"Your committee believes that this legislation is highly desirable to fill the gap in regulation that now exists by reason of the lack of authority of the State Commissions."

It will be noted that the House Committee specifically stated that the legislation was intended to be confined to the transportation and sale of natural gas in interstate commerce and to regulate sales for resale, or so-called wholesale sales, in interstate commerce, which were not subject to State regulation. The cases cited in the House Committee's report, namely, *Missouri v. Kansas Natural Gas Company*, 265 U. S. 298 and *Public Service Commission v. Attleboro Steam and Electric Company*, 273 U. S. 83, demonstrate the character of transaction which the legislation intended to regulate.

In the *Missouri case*, it appeared that the Kansas Natural Gas Company was transporting natural gas from points in the State of Oklahoma into the states of Kansas and Missouri and sold the gas at wholesale to independent distributing companies. The state commissions of Kansas and Missouri attempted to prescribe the rates to be charged by the Kansas Natural Gas Company to distributing companies in various cities and towns in the two states. The Court held the attempted regulation to be beyond the power of the state authorities, saying:

> "The business of supplying, on demand, local consumers is a local business, even though the gas be brought from another State and drawn for distribution directly from interstate mains; and this is so whether the local distribution be made by the transporting company or by independent distributing companies. In such case the local interest is paramount, and the interference with interstate commerce, if any, indirect and of minor importance. But here the sale of gas is in wholesale quantities, not to consumers, but to distributing companies for resale to consumers in numerous cities and communities in different States. The transportation, sale, and delivery constitute an unbroken chain, fundamentally interstate from beginning to end, and of such continuity as to amount to an established course of business. The paramount interest is not local but national; admitting of and requiring uniformity of regulation. Such uniformity, even though it be the

uniformity of governmental nonaction, may be highly necessary to preserve equality of opportunity and treatment among the various communities and States concerned."

In the *Attleboro case*, this Court dealt with an attempt on the part of the Rhode Island regulatory commission to fix the rate to be charged for electric energy generated in Rhode Island and transmitted and sold at the state line to a Massachusetts distributing company. This Court held the sale beyond the scope of state regulation.

The Commission, in its brief below in the instant cause, laid great stress upon the circumstance that the House Committee, in its report upon the proposed legislation, used as an example "sales by *producing* companies to distributing companies." We do not believe the use of this language is in any manner persuasive or controlling, especially in view of the fact that, if it is given the significance attached to it by the Commission, the specific exemption of "the production and gathering of natural gas" in Section 1 (b) of the Act would thereby be nullified. The all-embracing, unambiguous and unequivocal language of the statute should certainly be given greater weight than any such ambiguous phrase in the Committee report. Whereas the Committee, in this one reference, referred to sales by *producing* companies to distributing companies, the context of the preceding language in the report clearly demonstrates that only the transportation and sale for resale of natural gas were intended to be covered by the Act. It would be a most unusual (if not wholly unheard of) situation for a company only *producing* natural gas to make a sale in interstate commerce directly from its production property to a *distributing* company. Some *transportation* is obviously required from the field to the point of distribution to ultimate consumers.

Thus, it is obvious that the Natural Gas Act was intended by Congress to cover only the transportation and the sale of natural gas in interstate commerce for resale, or so-

called wholesale sales. It was specifically *not* intended to include the production, gathering, or local distribution of natural gas. The Congressional purpose was reiterated by Senator Wheeler, Chairman of the Senate Committee on Interstate Commerce, who sponsored the legislation in the Senate, when he engaged in the following colloquy with Senator Austin of Vermont during debate in the Senate (Cong. Rec., Vol. 81, Part 8, p. 9312):

> "Mr. Austin. Mr. President, may I ask the Senator from Montana a question concerning this bill? Does the bill undertake to regulate the production of natural gas, or does it undertake to regulate the producers of natural gas?
>
> "Mr. Wheeler. It does not attempt to regulate the production of natural gas or the distributors of natural gas; only those who sell it wholesale in interstate commerce."

It certainly was not the intention of the sponsors of the legislation to encompass production and gathering activities of natural gas companies within the scope of the Natural Gas Act. At a hearing on an earlier bill (Hearings on H. R. 11662, House Committee on Interstate and Foreign Commerce, 74th Cong., 2nd Sess., pages 17, 28) Mr. Dozier DeVane, then Solicitor of the Federal Power Commission, stated that:

> "Mr. DeVane. The bill makes no attempt to regulate the production or gathering facilities of a natural-gas company, this function being purely local in character. . . ."
>
> "Mr. DeVane. Now, section 1 (b) also provides that the Commission shall have no jurisdiction over the gathering or gathering rates for natural gas.
>
> "Mr. Cooper. What do you mean by gathering rates?
>
> "Mr. DeVane. The rates that are paid in the gathering field, Mr. Cooper.
>
> "Mr. Cooper. All right."

Chairman Lea of the House Committee on Interstate and Foreign Commerce, who sponsored the bill which became the Natural Gas Act, stated on the floor of the House, when he presented the legislation, that the "bill does not apply to the production and gathering of gas." (Cong. Rec., Vol. 81, Part 6, p. 6721).

It is thus apparent, from the legislative history of the Natural Gas Act, that Congress clearly intended to cover only the *transportation* and *sale* of natural gas in interstate commerce, and expressly excepted the *production*, *gathering* and *distribution* of natural gas. Congress was fully aware of the differences between the functional operations of natural gas companies, and with such full and complete knowledge, it expressly and in plain language excepted production and gathering.

II. The Commission Improperly Asserted Jurisdiction Over Production and Gathering in this Proceeding.

Notwithstanding the clear and unambiguous language of the statute and the legislative history thereof, the Commission has in this proceeding assumed jurisdiction over the production and gathering of natural gas by Canadian, and over its facilities used for such production and gathering. The purported justification for this assertion of jurisdiction is the statement in the Commission's opinion that Canadian's production and gathering operations are an integral part of its total operations, and that it is therefore "indispensable" for the Commission to investigate its production and gathering operations and property and to deal with the same in establishing the rate base, in order to regulate the Company's rates and charges for the sale of natural gas in interstate commerce for resale and for the transportation of natural gas in interstate commerce. The complete discussion of the Commission on this subject follows:

> "The particular contention of Canadian, that insofar as it is engaged in the production and gathering of natural gas it is not subject to the jurisdiction of the

Commission, is unsound. Canadian's production and gathering operations are an integral part of its total operations, including transportation in interstate commerce and the sale of natural gas for resale in interstate commerce. Furthermore, Canadian's operations are an integral part of Colorado's operations and the two comprise a single operating system. The investigation of Canadian's production and gathering property and operations is indispensable in regulating Canadian's rates and charges for the sale of natural gas in interstate commerce for resale and for the transportation of natural gas in interstate commerce."

The Commission made no reference whatever, in its discussion of this jurisdictional question, to the fact that, under Sec. 1 (b), the provisions of the Act are specifically made inapplicable to "the production or gathering of natural gas." In effect, the exemption of production and gathering from its jurisdiction was cast aside by the Commission on the premise that if the Commission should determine that it is necessary or "indispensable" to exercise such jurisdiction, then it may do so, irrespective of the clear and unequivocal language of the statute to the contrary.

The Circuit Court of Appeals recognized that, under the provisions of Sec. 1 (b) of the Act, Canadian River's production and gathering properties and facilities "lie beyond the range of the rate-regulatory jurisdiction of the Commission." However, the Circuit Court upheld the Commission's action on the ground that the Commission did not really exercise jurisdiction over production and gathering "as such," because the Commission did not separately prescribe rates or charges applicable to the company's production or gathering operations. The Court stated that the Commission's inquiry into production and gathering activities was "merely in their relation to the fixing of reasonable rates to be exacted and received for the natural gas moved in interstate commerce and sold for resale," and the Court stated that it failed "to find in the Act anything which expressly or by fair implication indicates a Congres-

sional purpose to restrict or withhold from the Commission jurisdiction in a case of this kind to take into consideration the production and gatherng properties only as they have bearing upon the question of the fixing of reasonable rates for gas moved interstate and sold for public consumption." The Court also stated that the Commission "did not attempt to affect in any manner the acquiring and maintaining of gas leaseholds, gas rights, or gas wells," nor "did it undertake to affect anywise the location, construction, extension or physical connections of pipelines, or the operation of pipelines or other facilities constituting the gathering properties." (142 F. (2d) 952-953.)

We submit that both the Commission and the Circuit Court wholly disregarded the unequivocal language of the statute, which excludes from the Commission's jurisdiction, without any exception whatsoever, "the production or gathering of natural gas." There is nothing in the language of the Act itself, nor in its legislative history, which either intimates or suggests that it was the intention of Congress to vest in the Commission the discretionary power to determine that it could exercise jurisdiction over production and gathering upon a finding that the assertion of such jurisdiction is in its opinion necessary or "indispensable" in order effectively to regulate the transportation and sale of natural gas in interstate commerce. If that had been the legislative purpose, Congress most assuredly would have made that intention known. Instead, Congress, without any qualification or exception, excluded from the provisions of the Act "the production or gathering of natural gas." We most earnestly suggest that Congress meant precisely what it said when it used that language, and we urge that it is no less than a plain distortion of the legislative intent to contend that Congress meant to vest the Commission with the power to determine when and whether it should exercise jurisdiction over production and gathering operations. Yet, it is clear from the language used by the Commission in its discussion of this issue in its opinion in this case that the Commission thus interprets the provisions of the Act.

If the Commission considers the provisions of the Act inadequate effectively to enable it to perform its function to regulate rates and charges for the transportation or sale for resale of natural gas in interstate commerce, then it would seem appropriate for the Commission to seek amendatory legislation from Congress, rather than thus to attempt to stretch the provisions of the Act to include jurisdiction over a subject so obviously not in contemplation by Congress when it enacted this statute. If there is believed to be any defect in the present statute in respect to the necessity for regulation of production and gathering operations, the responsibility therefor rests with Congress, the legislative body. It is not the responsibility of the Commission or of the Courts to attempt to cure any such alleged defect by interpreting the Act to give the Commission the character of jurisdiction which Congress plainly intended it should not possess.

It is not difficult to imagine instances in which it would seem wise or unwise, necessary or unnecessary, dispensable or indispensable for the Commission to exercise jurisdiction over production and gathering operations. For example, one company may operate only gas wells, selling its natural gas at the well-head; another company may operate its gas wells in conjunction with gathering facilities and make sales either at the well-head or from the gathering facilities, while another company may operate not only gas wells, but also gathering *and* transportation facilities and may make sales at the well-head, from the gathering facilities, from the transportation facilities, or any combination thereof. Companies producing or gathering gas may or may not be affiliated with other companies engaged either in the production, gathering or transportation of natural gas, and if affiliated, the extent of the affiliation may be minor or major.

Our contention is that Congress, by the exclusion language contained in Section 1(b), did not intend to leave with the Commission the discretionary authority to deter-

mine whether or not it could or should exercise rate regulatory jurisdiction over production and gathering of natural gas in any such particular instance. Congress unqualifiedly excepted production and gathering from the Commission's authority, and effect should be given to the plain language of the statute. Of course, questions may conceivably arise as to whether a particular line is a "gathering" or a "transportation" facility, and the Commission doubtless has the primary responsibility of determining that question of fact in order to reach a conclusion on the question of jurisdiction. However, when the Commission has determined, as it did in the proceeding under review, that a portion of a company's operations are production or gathering operations, it may not, without disregarding the plain language of the statute, exercise jurisdiction over such production or gathering operations merely on the ground that in its opinion it is "indispensable" to assert such jurisdiction in order effectively to regulate the transportation and sale for resale of natural gas in interstate commerce.

In this connection, it seems pertinent and important to note that regulation by the Commission of the production and gathering of natural gas has now progressed to the point where the exclusion language contained in Section 1(b) on that subject has practically been interpreted out of the Natural Gas Act. In the first major test case involving the Commission's authority over production and gathering, namely, *Re Columbian Fuel Corporation*, 35 P.U.R. (N.S.) 3, the Commission had instituted a proceeding, on its own motion, suspending the operation of certain increases in prices for natural gas sold by the Columbian Fuel Corporation to the Warfield Natural Gas Company. The Commission found that the Columbian Fuel Corporation produced and gathered natural gas in the State of Kentucky, which it sold to the Warfield Natural Gas Company, the point of delivery of the gas being at the termini of the Columbian Company's gathering lines or from a compressor station owned and operated by it. All of the facilities

of the Columbian Company were located in the State of Kentucky, and deliveries of the gas were made within that State. Warfield Natural Gas Company owned and operated a natural gas transmission system in the State of Kentucky which connected with transmission lines of the United Fuel Gas Company at the Kentucky-West Virginia state line and with the transmission lines of the Atlantic Seaboard Corporation in the State of Kentucky. In respect to the ultimate disposition of the natural gas sold by the Columbian Company to the Warfield Company, the Commission found as follows:

> "(6) A part of the natural gas sold by respondent is resold by the latter within the state of Kentucky. A large portion of the gas sold by respondent to Warfield is resold by the latter to United and is transmitted into the state of West Virginia. The gas is then resold by United for commercial and industrial uses without the state of Kentucky. From 40 to 50 per cent of the gas sold by respondent to Warfield is delivered by the latter to the Seaboard line from which the gas is sold and delivered in large quantities to local distributing companies in West Virginia and Maryland.
>
> "(7) There is a regular unbroken and uninterrupted transmission and a continuous flow of the natural gas sold by respondent to Warfield from the areas in Kentucky to destinations in other states and in the District of Columbia. Such transportation is intended to be and is being carried on as an established course of business." (35 P.U.R. (N.S.) 3, 5-6).

The Columbian Company contended, among other things, that even on the assumption that its sales of natural gas to the Warfield Company were "sales in interstate commerce," the provisions of the Act were not applicable to it, as its function was solely that of a producer and gatherer of natural gas. It also contended that the sales to the Warfield Company were not sales in interstate commerce and that it was therefore not a natural-gas company within the meaning of the provisions of the Act.

This proceeding provoked considerable interest, not only within the industry, but also on the part of state regulatory officials. *Amici curiae* included the Public Service Commission of West Virginia, the National Association of Railroad and Utilities Commissioners, the Mid-Continent Oil and Gas Association, and the Independent Petroleum Association of America. Briefs were filed on behalf of these organizations and their counsel participated in oral argument before the Commission. Uniformly, all of the *amici curiae* supported the Columbian Company's contention that the sales of natural gas involved were not subject to the Commission's jurisdiction under the provisions of the Natural Gas Act. The opposite contention was made by counsel for the Federal Power Commission, who filed a brief and participated in the oral argument before it, and who urged the Commission to assert jurisdiction.

The Commission (with one Commissioner alone dissenting) declined to assume jurisdiction over the sales involved in the *Columbian Fuel case*, vacated the order of suspension, and dismissed the proceeding. In reaching the conclusion that the Commission lacked jurisdiction in this particular case, the majority opinion of the Commission appears definitely to indicate that there was no question in the minds of the participating Commissioners but that the sales in question were *in interstate commerce*. The negative language in Section 1(b), excluding from the provisions of the Act "the production or gathering of natural gas," however, was held to be controlling and determinative of the jurisdictional issue. Accordingly, in that case, the Commission apparently determined that the Act does not vest it with jurisdiction over sales of natural gas in interstate commerce when such sales are merely incidental to the production and gathering of natural gas.

There is language in the opinion in the *Columbian Fuel case*, however, which might be interpreted as qualifying the general statement that the Commission held that it does not have jurisdiction over sales of natural gas in interstate

commerce which are thus merely incidental to production and gathering. The Commission concluded that "it was not the intention of Congress to subject to regulation under the Natural Gas Act *all* persons whose only sales of natural gas in interstate commerce, as in that case, are made as an incident to and immediately upon completion of such person's production and gathering of said natural gas and who are not otherwise subject to the jurisdiction of this Commission." The Commission then alluded to the circumstance that further experience with the administration of the Natural Gas Act "may reveal that the initial sales of large quantities of natural gas which eventually flows in interstate commerce are by producing or gathering companies which, *through affiliation, field agreement, or dominant position in a field*, are able to maintain an unreasonable price despite the appearance of competition." Under such circumstances, the Commission stated, it "will decide whether it can assume jurisdiction over arbitrary field prices under the present act or should report the facts to Congress with recommendations for such broadening of the act and provision of additional machinery as may appear necessary to close this gap in effective regulation of the natural gas industry." Apparently it did not occur to the Commission that it could deal effectively with such unusual cases, where unreasonable prices were being charged, through the exercise of its proper authority over the allowable operating expenses of the transportation entities, rather than by doing violence to the Act through disregard of the exemption of production and gathering activities from its jurisdiction. We shall discuss this phase of the problem briefly at a later point.

Apparently adhering to its ruling in the *Columbian Fuel case*, the Commission subsequently issued various orders exempting particular companies from the provisions of the Natural Gas Act. In these orders the Commission found that the companies involved were engaged only in the production and gathering of natural gas, that sales were made

either from the well mouth or at the end of the gathering facilities, that there was no affiliation between the selling and purchasing companies, and that the applicant companies did not occupy "dominant" positions in their respective fields which enabled them to control prices of production.[1]

However, since the decision of the United States Court of Appeals for the District of Columbia in *Peoples Natural Gas Company* v. *Federal Power Commission*, 127 F. (2d) 153 (cert. denied, 316 U. S. 700), the Commission has apparently adopted the position that it has all-inclusive jurisdiction over sales from production and gathering facilities, notwithstanding the language to the contrary in Section 1(b) of the Act. For example, in an opinion in a rate proceeding, *In the Matter of Interstate Natural Gas Company*, 48 P.U.R. (N.S.) 267, 273, the Commission, apparently disregarding the position which it had taken in the *Columbian Fuel case, supra*, commented as follows:

> "The negative language in Section 1(b) upon which the Interstate Company relies for its claimed exemption involving these sales provides that the Commission shall not have jurisdiction over 'the production or gathering of natural gas.' When the distinction between *production and gathering* of natural gas, and the *sale* of such gas in interstate commerce is kept in mind, effect is given to the Congressional objective. [Footnote: For the distinction between production of a commodity and sales of such commodity in interstate commerce, see *Carter* v. *Carter Coal Co.*, 298 U. S. 238, 302-4.] The Commission is bound to obey the command of Congress to regulate these sales in interstate commerce for resale to the three pipe line Companies. Such is clearly the implication of the decision of the

[1] See orders *In the Matter of Repollo Oil Company* (Docket No. G-195, July 1, 1941); *Sinclair Prairie Oil Company* (Docket No. G-197, July 8, 1941); *Kentucky Ohio Gas Company* (Docket No. G-198, July 8, 1941); *Magnolia Petroleum Company* (Docket No. G-189, July 8, 1941); *Sinclair Wyoming Oil Company* (Docket No. G-196, July 15, 1941); *The Chartiers Oil Company* (Docket No. G-191, September 9, 1941).

Circuit Court of Appeals in *Peoples Natural Gas Co.* v. *Federal Power Commission*, 127 F. (2d) 153; cert. den. 316 U. S. 700."

In their brief in the Circuit Court of Appeals for the Tenth Circuit in this proceeding, Counsel for the Commission relied strongly upon the decision of the Court of Appeals of the District of Columbia in the *Peoples case* there cited, to support their claim that the Commission had exercised proper authority over Canadian's production and gathering operations. We believe that a fair analysis of the decision in the *Peoples case* definitely discloses that it does not support the Commission's contention.

In the *People's case*, the Commission had instituted an investigation to determine whether the Company was a "natural-gas company," as defined in the Natural Gas Act, and also whether any of its rates, subject to the Commission's jurisdiction, were unjust or unreasonable. In connection with this investigation, the Commission sought access to certain of the Company's books and records, and upon failure of the Company to comply, the Commission brought an action in the District Court to compel compliance with its subpoenas requiring production of certain books and records. The District Court held with the Commission, and the case was appealed to the Court of Appeals for the District of Columbia. It is apparent that the decision of the Court of Appeals, which upheld the right of the Commission to subpoena the books and records, was predicated almost entirely upon a factual allegation by the Commission, which was not denied by the Peoples Company, that it made a sale of natural gas for resale in interstate commerce to an affiliated company. The Court said:

"The Commission's motion, apart from annexed exhibits, does not clearly allege any facts which show that the Commission had jurisdiction to demand these books and records. But in Paragraph IX the Commission annexed to and expressly made a part of its motion, as Exhibit F, a copy of an order by which it had di-

rected its counsel to bring the present proceedings. In Paragraph (d) of Exhibit F the Commission states: 'The testimony and evidence adduced (at a certain hearing) shows, among other things, that Peoples sells natural gas at its new compressor station in Clarion County, Pennsylvania, to New York State Natural Gas Corporation, an affiliated company, and that the latter immediately transports said natural gas into the State of New York where it sells the same to others for resale for ultimate public consumption * * *.'

"The sales thus described are sales in interstate commerce [citing *Public Utilities Commission of Rhode Island* v. *Attleboro Steam and Electric Company*, 273 U. S. 83; *Missouri* v. *Kansas Natural Gas Company*, 265 U. S. 298; *Illinois Natural Gas Company* v. *Central Illinois Public Service Company*, 314 U. S. 498; *United States* v. *Rock Royal Cooperative, Inc.*, 307 U. S. 533; *Currin* v. *Wallace*, 306 U. S. 1]. Appellants urge that the Natural Gas Act does not give the Commission jurisdiction over all sales of natural gas in interstate commerce. But the Natural Gas Act does apply, among other things, to 'the sale in interstate commerce of natural gas for resale for ultimate public consumption for domestic, commercial, industrial, or any other use.' That language exactly covers the sales described in Exhibit F. We cannot disregard the plain language of the statute because the Commission at one time interpreted it narrowly [citing *In the Matter of Columbian Fuel Corporation*, Opinion No. 48, Docket No. G-143, 35 P.U.R. (N.S.) 3], or because the reports of Congressional committees show an intention not to 'disturb' state regulation, or because appellants fear duplicate regulation. The Act applies to 'natural-gas companies engaged in such * * * sale', and defines 'natural-gas company' as a company 'engaged in the transportation of natural gas in interstate commerce, or the sale in interstate commerce of such gas for resale.' * * *

"Appellants have nowhere denied the statements in Paragraph (d) of Exhibit F. Their answer to the Commission's motion denies that the Company is a natural-gas company within the meaning of the Natural Gas Act, and states that it 'does not transport natural

gas in interstate commerce or sell natural gas in interstate commerce for resale for ultimate public consumption for domestic, commercial, industrial, or any other use.' But these denials are in the nature of legal conclusions, since they turn, or may turn, on the meaning of the legal terms 'natural-gas company' and 'interstate commerce.' They cannot be deemed denials of the statements of fact in Exhibit F. * * * During oral argument in the District Court counsel conceded that the Company often sells gas to the New York Company, and impliedly conceded that this gas is sold for transportation to New York and resale. On this appeal counsel again concede that the Company sells to the New York Company gas which it transports to New York. Appellants nowhere suggest that these sales are not 'for resale for ultimate public consumption.' * * *"

After the Peoples Company had filed a petition for rehearing, the Court made this additional comment:

"Appellants urge that the Company's sales to the New York company, for transportation to New York and resale, are not 'sale(s) in interstate commerce' of natural gas for resale within the meaning of the Natural Gas Act. * * * Their position is not that Congress could not, but that it did not, authorize the Commission to regulate such sales. We think the position is untenable.

"The Supreme Court has lately held that sales to distributors of natural gas which has been brought from another state are within the jurisdiction of the Federal Power Commission [citing *Illinois Natural Gas Company v. Central Illinois Public Service Co.*, 314 U. S. 498].

"Sales of gas which has just moved interstate and sales of gas which is about to move interstate have like practical effects. Neither the Committee nor Congress nor the Court appears to have distinguished between them in regard to the application of the Act; in fact the contrary appears. To illustrate the sales which the Act was designed to reach, the Committee referred to two Supreme Court cases. One of these involved sale and delivery after the state line had been crossed; but

the other involved sale and delivery at the state line. [Citing *Public Utilities Commission* v. *Attleboro Steam & Electric Company*, 273 U. S. 83]. And in the recent Illinois Natural Gas case, quoted above, the Court said: '* * * the particular point at which the title and custody of the gas passed to the purchaser without arresting its movement to the intended destination does not affect the essential interstate nature of the business.' Still more recently, in another case upholding the Federal Power Commission's authority under the Act, the Court said: 'The sale of natural gas originating in one state and its transportation and delivery to distributors in any other state constitutes interstate commerce. * * *.' [Citing *Federal Power Commission* v. *Natural Gas Pipeline Company of America*, 315 U. S. 575]. Though that case involved sales in the state of destination, the quoted language governs sales in the state of origin. * * *

"Appellants urge that 'in interstate commerce' is a narrower term than 'in or affecting interstate commerce,' and that Congress did not delegate to the Commission its entire power over natural gas. This is true. Sales which merely 'affect' interstate commerce are outside the Act. But this throws no light on the question whether the Company's sales to the New York Company are 'in' interstate commerce."

The Court of Appeals of the District of Columbia, in its decision in the *Peoples case*, made no reference whatever to the language in Section 1(b) of the Act exempting "the production and gathering of natural gas" from the jurisdiction of the Commission. There was no need for the Court to discuss that question, inasmuch as the Company had in effect admitted that it made a sale for resale of natural gas in interstate commerce[1] and therefore, in the

[1]The sale by the Peoples Company was described by the Company itself as follows: "Gas so sold to New York State Natural Gas Corporation is delivered to that Company at the outlet of the Respondent's Pew Compression Station located in Limestone Township, Clarion County, Pennsylvania, from which point the gas is transported in a northeasterly direction

absence of any detailed explanatory facts of record, there was a sufficient predicate for the Court to hold that the Commission had authority to examine the books and records of the Peoples Company.

It will be noted that the Court of Appeals for the District of Columbia, in the *Peoples case*, cited and relied upon decisions of this Court in gas and electric cases involving the question of what constitute sales in interstate commerce. The *Attleboro* and *Kansas Natural Gas Company cases* have been heretofore discussed in this brief. They were cited in the Congressional committee reports on the Natural Gas Act to illustrate the character of transaction intended to be covered by the Act, namely, the transportation and sale for resale of natural gas in interstate commerce, or so-called wholesale sales. The other cases cited by the Court in the *Peoples case* show clearly that the Court was passing only on the question whether a sale of gas *within* a state, when such gas moves in a continuous stream in interstate commerce, is subject to regulation by the Commission.

In the *Illinois Natural Gas Company case* (314 U.S. 498), this Court had before it the question whether the Illinois Commerce Commission or the Federal Power Commission had jurisdiction to require an extension of facilities by the Illinois Natural Gas Company, whose properties were located wholly within the State of Illinois. The Court held

---

a distance of approximately 90 miles to a point in Hebron Township, Potter County, Pennsylvania, through a 12" pipe line owned by the Respondent but leased to and operated by the New York State Natural Gas Corporation under an agreement of lease dated January 2, 1940, at which point said 12" pipe line connects with the pipe lines owned by New York State Natural Gas Corporation. * * * Upon the delivery of the gas by Respondent to New York State Natural Gas Corporation at Respondent's Pew Compressing Station as aforesaid, the gas passes out of the possession of the respondent and thereafter Respondent has no control over the transportation, sale or disposition of said gas." (Answer to Order to Show Cause, Appendix to Appellant's Brief in Court of Appeals for the District of Columbia, p. 36).

that the natural gas purchased by Illinois Natural from its affiliate, Panhandle Eastern Pipeline Company, moved in a continuous stream in interstate commerce, and that therefore the Power Commission had jurisdiction over the extension of facilities involved, under the provisions of the Natural Gas Act. It is clear from this Court's opinion that Illinois Natural owned "transmission" lines, and there was no question involved or discussed in respect to the Federal Power Commission's jurisdiction over production and gathering facilities. As a matter of fact, the discussion of this Court in the *Illinois Natural case* fully corroborates our position that the provisions of the Natural Gas Act were *restricted* to the transportation and sale of natural gas in interstate commerce for resale. This Court said:

> "An avowed purpose of the Natural Gas Act of June 21, 1938, was to afford, through the exercise of the national power over interstate commerce, an agency for regulating the wholesale distribution to public service companies of natural gas moving interstate, which this Court had declared to be interstate commerce not subject to certain types of state regulation. H.R. No. 709, Committee on Interstate and Foreign Commerce, 75th Cong., 1st Sess., April 28, 1937. By its enactment Congress undertook to regulate a defined class of natural gas distribution without the necessity, where Congress has not acted, of drawing the precise line between state and federal power by the litigation of particular cases. *By Section 1(b), 15 U.S.C. Section 717 (b), the Act is restricted* in its *application* to 'the transportation of natural gas in interstate commerce, to the sale in interstate commerce of natural gas for resale for ultimate public consumption for domestic, commercial, industrial, or any other use, and to natural-gas companies engaged in such transportation or sale. . . .' And by Section 2(6), 15 U.S.C. Section 717a(6) 'natural-gas company' means a person [including a corporation] engaged in the transportation of natural gas in interstate commerce or the sale in interstate commerce of such gas for resale. Sections 4, 5, 6, 15 U.S.C. Section 717, c, d, e, give the Federal Power Commission extensive con-

trol over the rates at which the gas is sold for resale. Under Section 7(a), 15 U.S.C. Section 717f(a) the Commission has authority to order natural-gas companies to extend their systems to establish physical connections of their transportation facilities with those of distributors and to sell gas to them. Section 7(b) prohibits the abandonment of the facilities of natural-gas companies without approval of the Commission. Section 7(c), here involved, provides that 'No natural-gas company shall undertake the construction or extension of any facilities for the tansportation of natural gas to a market in which natural gas is already being served by another natural-gas company, or acquire or operate any such facilities or extensions thereof, or engage in any transportation by means of any new or additional facilities, or sell natural gas in any such market,' without the Federal Commission's certificate of public convenience and necessity.

"We think it plain that these provisions, read in the light of the legislative history, *were intended to bring under federal regulation wholesale distribution, like that of appellant, of gas moving interstate*. Appellant engages in interstate commerce in gas and in its interstate transportation as those terms had been defined by this Court, before the adoption of the Act. After the gas is brought into the state appellant makes the first sale to distributors for resale, to which the Act in terms applies, and which the cases last mentioned defined as a part of the commerce subject in some respects to the exclusive regulation of Congress. *Cf. Parker* v. *Motor Boat Sales, Inc.*, No. 46, decided this term. Section 7 of the Act commits to the Federal Commission the control of extensions and abandonment of the transportation facilities of natural gas companies, their physical connection with those of distributors and sales to distributors, and prohibits extensions, such as the state commission has now ordered, into an area already served by another natural gas company, unless the Commission has first granted a certificate of public convenience and necessity. Since the communities here are supplied by the Universal and Central companies, which transport the gas interstate, they constitute a

market already served by a natural gas company within Section 7(c) and Section 2(6) of the Act.

"The Federal Commission has ruled that it has jurisdiction under the Act over companies which, like appellant, sell at wholesale to local distributors gas moving interstate. *Re Billings Gas Company*, 35 P.U.R. (N.S.) 321; *Re East Ohio Gas Company*, 28 P.U.R. (N.S.) 129. The proceedings of the Commission under Section 7 (c) indicate the many important matters which it takes into consideration in determining whether an extension of facilities in a case such as this should be permitted."

In *Public Utilities Commission of Ohio* v. *United Fuel Gas Company*, 317 U.S. 456, this Court stated that:

"It is clear, as the legislative history of the [Natural Gas] Act amply demonstrates, that Congress meant to create a comprehensive scheme of regulation which would be complementary in its operation to that of the states, without any confusion of functions. The Federal Power Commission would exercise jurisdiction over matters in interstate and foreign commerce, *to the extent defined in the Act*, and local matters would be left to the state regulatory bodies."

The question of the jurisdiction of the Commission over "the production and gathering of natural gas" was not specifically involved in *Federal Power Commission et al.*, v. *Natural Gas Pipeline Company of America et al.*, 315 U.S. 575. In that case, for the purpose of entering an interim order reducing rates, the Commission accepted the companies' evidence in respect to reproduction cost new, the *value* of gas reserves, capital additions and working capital, when it determined a rate base. It also accepted substantially the companies' showing in respect to operating revenues and expenses (except as to the manner of determining annual amortization expense). Accordingly, in that case, there was no occasion for anyone to contest the authority of the Commission over production and gathering

facilities, and the question was not discussed in this Court's opinion. The issue simply was not presented. In connection with its discussion of the constitutionality of the Natural Gas Act, this Court did observe, however, that:

> "The sale of natural gas originating in one state and its *transportation* and *delivery* to distributors in any other state constitutes interstate commerce, which is subject to regulation by Congress."

In *Federal Power Commission et al.* v. *Hope Natural Gas Company*, 320 U.S. 591, the Hope Company raised no question concerning the jurisdiction of the Commission over its production and gathering operations. In respect to leaseholds, the company made its showing on a *cost* rather than a *value* basis and apparently did not desire to press any question concerning the Commission's authority over production and gathering operations. In connection with its discussion of the position of the State of West Virginia, the Court observed (320 U.S. at p. 609: 612):

> "We pointed out in *Illinois Natural Gas Co.* v. *Public Service Co.*, 314 U. S. 498, 506, that the purpose of the Natural Gas Act was to provide, 'through the exercise of the national power over interstate commerce, an agency for regulating the wholesale distribution to public service companies of natural gas moving interstate, which this Court had declared to be interstate commerce not subject to certain types of state regulation.' As stated in the House Report the 'basic purpose' of this legislation was 'to occupy' the field in which such cases as *Missouri* v. *Kansas Gas Co.*, 265 U. S. 298, and *Public Utilities Commission* v. *Attleboro Steam & Electric Co.*, 273 U. S. 83, had held the States might not act. H. Rep. No. 709, 75th Cong., 1st Sess., p. 2. In accomplishing that purpose the bill was designed to take 'no authority from State commissions' and was 'so drawn as to complement and in no manner usurp State regulatory authority.' *Id.*, p. 2. And the Federal Power Commission was given no authority over the 'production or gathering of natural gas.'
>
> * * * * *

"We do not mean to suggest that Congress was unmindful of the interests of the producing states in their natural gas supplies when it drafted the Natural Gas Act. As we have said, the Act does not intrude on the domain traditionally reserved for control by state commissions; and the Federal Power Commission was given no authority over 'the production or gathering of natural gas.' Sec. 1(b). In addition, Congress recognized the legitimate interests of the States in the conservation of natural gas. By Sec. 11 Congress instructed the Commission to make reports on compacts between two or more States dealing with the conservation, production and transportation of natural gas."

It is true that the majority opinion of the Court in the *Hope case*, in a footnote (320 U. S. at p. 614), negatived a suggestion (apparently made by the State of West Virginia) that the exemption language in Section 1(b) precluded the Commission from even ascertaining the cost of the production plant, and referred to Section 14(b) of the Act giving the Commission the power to "determine the propriety and reasonableness of the inclusion in operating expenses, capital, or surplus of all delay rentals or other forms of rental or compensation for unoperated lands and leases." However, as pointed out above, the Hope Company had raised no question concerning the Commission's authority over production. In the instant cause, Canadian has from the very outset of the proceeding contested, and still does vigorously contest, the Commission's authority over its production and gathering operations. If the Court's observations in its note to the *Hope case* decision appear to be in conflict with its prior statements, heretofore quoted, definitely stating that the Commission lacks authority over "the production or gathering of natural gas," it seems evident that no such mere dictum in a note should be deemed controlling over specific rulings of the character indicated.

In the instant cause the Commission relies upon certain decisions interpreting its jurisdiction under the Federal

Power Act to support its claim that it rightfully exercised jurisdiction over Canadian's production and gathering operations. We have heretofore pointed out in this brief (footnote on p. 13) that Congress treated the Federal regulation of electric and gas companies as separate and distinct propositions, and legislated separately with respect to the peculiarities of each business. This is apparent, not only from the legislative history of the two Acts, but also from the provisions of the Acts themselves. To illustrate the difference in legislative treatment accorded by Congress to electric and gas operations, we set forth below, in parallel columns, the provisions of Sections 201(a) and (b) of the Federal Power Act (which were involved in the electric cases relied upon by the Commission) and Sections 1(a) and (b) of the Natural Gas Act, which are involved in this proceeding:

Federal Power Act	*Natural Gas Act*
"Section 201. (a) It is hereby declared that the business of transmitting and selling electric energy for ultimate distribution to the public is affected with a public interest, *and the Federal regulation of matters relating to generation to the extent provided in this Part* and the Part next following and of that part of such business which consists of the transmission of electric energy in interstate commerce and the sale of such energy at wholesale in interstate commerce is necessary in the public interest, such Federal regulation, however, to extend only to those matters which are not	"Section 1. (a) As disclosed in reports of the Federal Trade Commission made pursuant to Senate Resolution 83 (Seventieth Congress, first session) and other reports made pursuant to the authority of Congress, it is hereby declared that the business of transporting and selling natural gas for ultimate distribution to the public is affected with a public interest, and that Federal regulation in matters relating to the transportation of natural gas and the sale thereof in interstate and foreign commerce is necessary in the public interest. "(b) The provisions of this act shall apply to the trans-

subject to regulation by the States.

"(b) The provisions of this Part shall apply to the transmission of electric energy in interstate commerce and to the sale of electric energy at wholesale in interstate commerce, but shall not apply to any other sale of electric energy or deprive a State or State commission of its lawful authority now exercised over the exportation of hydroelectric energy which is transmitted across a State line. The Commission shall have jurisdiction over all facilities for such transmission or sale of electric energy, but shall not have jurisdiction, *except as specifically provided in this Part and the Part next following, over facilities used for the generation of electric energy* or over facilities used in local distribution or only for the transmission of electric energy in intrastate commerce, or over facilities for the transmission of electric energy consumed wholly by the transmitter."

portation of natural gas in interstate commerce, to the sale in interstate commerce of natural gas for resale for ultimate public consumption for domestic, commercial, industrial, or any other use, and to natural-gas companies engaged in such transportation or sale, but shall not apply to any other transportation or sale of natural gas or to the local distribution of natural gas or to the facilities used for such distribution or to the production or gathering of natural gas."

It will be readily observed, from the italicized portion of Sections 201(a) and (b) of the Federal Power Act, that Congress apparently *did not* entirely exclude generation of electric energy from the Commission's jurisdiction under the Federal Power Act. On the contrary, Congress *did* entirely exclude the production and gathering of natural gas from the jurisdiction of the Commission under the

Natural Gas Act, and the Act contains no language whatever even hinting that it was intended to be applicable in any manner to production and gathering operations. This difference in the language of the statutes should be kept definitely in mind in considering the possibility that the electric cases may constitute precedents supporting the Commission's contentions.

Jersey Central Power & Light Company v. *Federal Power Commission*, 319 U.S. 61 involved the question whether the Jersey Central Company was a "public utility" subject to the Commission's jurisdiction under the Federal Power Act. This Court held that the company owned and operated "transmission" facilities which subjected it to the jurisdiction of the Commission, even though the transmission took place wholly within one state, citing and relying upon the decisions of this Court in the *Attleboro* and *Illinois Natural cases, supra*. That acts of "transmission" were involved in the *Jersey Central case* appears beyond question from the language used by this Court, for it said:

> "Further, we think the definition in subsection (e) of 'public utility' covers Jersey Central, since that company owns and operates the *transmission* line to the Raritan and that line, as a result of the interpretation of interstate commerce in the preceding paragraph, is a facility under Commission jurisdiction by the terms of subsection (b)."

Hartford Electric Light Company v. *Federal Power Commission*, 131 F. (2d) 953 (cert. den., 319 U.S. 741) upon which great reliance is placed by the Commission in defending its position in this case, may readily be distinguished from the instant proceeding. The *Hartford case* involved the question whether the company was a "public utility" as defined in the Federal Power Act and as such required to comply with an order of the Commission prescribing a system of accounts. The opinion of the Circuit Court in the *Hartford case*, which held that the company's sales from

generating facilities subjected it to the jurisdiction of the Commission, was predicated in large measure upon the language in Sections 201(a) and (b) of the Federal Power Act vesting the Commission with authority over generation of electric energy and facilities used for such generation, when provided for in the Act. As pointed out, no similar language is contained in the Natural Gas Act, for "the production and gathering of natural gas" was excluded without any qualification whatever. It is true that the Court, in the *Hartford case*, cited and relied upon the decision of the Court of Appeals for the District of Columbia in the *Peoples case*, *supra*, but we believe a proper interpretation of that decision will demonstrate that it did not involve the issue of jurisdiction of the Commission over production and gathering of natural gas under Section 1(b) of the Natural Gas Act.

Since these electric cases did not involve the question of the exercise of rate jurisdiction by the Commission in a field not contemplated by Congress, they can hardly be relied upon to support the contention here made by the Commission.

In the instant proceeding, Canadian does not contest the fact that it is a "natural-gas company," as defined in the Natural Gas Act, for concededly it operates facilities for the transportation and sale of natural gas in interstate commerce. However, even though Canadian is a natural-gas company and, therefore, subject to the Commission's jurisdiction in certain respects, its production and gathering operations have been specifically excluded from the Commission's jurisdiction. This is the gist of its position.

The Circuit Court, in the instant proceeding, in one breath stated that, under Section 1(b) of the Act, the Commission "does not have *express or implied* rate-regulatory jurisdiction of the production and gathering of natural gas," and also that under Section 1(b) Canadian's production and gathering properties and facilities "lie beyond the range of the rate-regulatory jurisdiction of the Commission."

However, in the next breath, the Court concluded that the Commission did not exercise a prohibited jurisdiction over Canadian's production and gathering operations because it did not perform the formal function of prescribing rates and charges covering separately the production and gathering of natural gas. We respectfully submit that this conclusion of the Circuit Court is merely a play upon words, for the Commission could not possibly have exercised a more complete jurisdiction over production and gathering operations than it did in this proceeding. It treated the production and gathering properties of this company in the identical manner in which it treated the company's transportation properties, in respect to rate base, revenues, expenses, return, and all other elements considered—and it frankly said so in its opinion. The Circuit Court, in effect, states that the Commission may lawfully do *indirectly* what it may not do *directly*, without violating the language of the Act. We firmly believe that Congress obviously never intended to erect by such indirect method of avoiding the precise and unequivocal exemption language which it carefully inserted in Section 1(b) of the Act.

The Circuit Court commented further that the "Commission did not attempt to affect in any manner the acquiring and maintaining of gas leaseholds, gas rights, or gas wells." We are convinced that, in making this observation, the Circuit Court confused the meaning of the terms "conservation" and "production" of natural gas. The Commission did not, it is true, attempt to tell Canadian whether it could or should obtain permits from State authorities to drill wells, where or when the wells could be drilled, their spacing in the field, the permissible volume of gas to be taken from the wells, or matters of that nature, which are recognized to be "conservation" measures subject to control by State authorities and definitely affecting the "acquiring and maintaining of gas leaseholds, gas rights, or gas wells." Congress recognized the distinction between "conservation" and "production" of natural gas in the Natural Gas

Act, and excluded *both* from the jurisdiction of the Commission, as was clearly recognized and stated in the majority opinion of this Court in the *Hope case*, *supra* (320 U. S., at p. 613).

The observation of the Circuit Court that the Commission did not "undertake to affect anywise the location, construction and extension, or physical connections of pipelines, or the operation of pipe lines or other facilities constituting the gathering properties" was obviously *obiter dicta*, and must be deemed of no consequence here because there was no such issue involved in this rate-making proceeding. In any event, it is what the Commission did, rather than what it may have refrained from doing, which is at issue in this review.

Although the Circuit Court used language differing from that used by the Commission, it in effect upheld the contention of the Commission—stated with the utmost frankness in its brief before the Circuit Court (page 25)—to the effect that the exception language in Section 1(b) of the Act should be interpreted as follows:

> "The exception, therefore, amounts to saying that whenever necessaty for the purposes specifically provided in subsequent sections of the Act, the Commission shall have jurisdiction over production and gathering, etc.
>
> "Under this construction, the Commission has jurisdiction of production and gathering so far as production and gathering is in aid of sales of natural gas in interstate commerce for resale subject to the rate jurisdiction of the Commission."

At least the position of the Commission is stated with startling candor. In effect, it contends that the exemption language contained in Section 1(b) is *not* an exemption of production and gathering at all. Instead, it would have it that this language means just the opposite, namely, that the Commission *does* have jurisdiction over production and gathering whenever the Commission may be of the opinion

that it should exercise such jurisdiction as an aid to its regulation of sales for resale. Under this interpretation of the Act, the exemption of production and gathering from the Commission's authority becomes meaningless and of no consequence whatever, for all the Commission has to do is to determine that it is "necessary" to assume jurisdiction over production and gathering, and that is all there is to it. A more drastic departure from the express language of the Act, specifically exempting production and gathering from jurisdiction, could not possibly be imagined. Such an interpretation places Congress in the untenable position of saying one thing and really meaning just the opposite.

If the interpretation so urged by the Commission should finally be upheld, what is to prevent this body from regulating also the local distribution of natural gas? The language excluding the production and gathering of natural gas from the Commission's jurisdiction is as broad as is the language in the same subsection (Section 1(b)) excluding the distribution of natural gas from the Commission's authority. Yet the Commission, under the theory so advanced, might conclude it is "necessary" to control local distribution in order to make effective its regulation of sales for resale of natural gas. Following the logic of its contention in this proceeding, the Commission could also exercise jurisdiction over local distribution, and thereby further frustrate the clear legislative intent to the contrary.

Frankly, it is this tendency on the part of this regulatory body to attempt to extend its jurisdiction beyond the scope contemplated by Congress, whenever its philosophy renders it apparently "necessary" so to do, that gives us pause. The Independent Natural Gas Association of America is composed not alone of "natural-gas companies," subject to the Natural Gas Act because of their interstate gas transportation activities, but it has among its members many producers of natural gas who sell such gas at the well-head or at the end of their gathering operations. If jurisdiction over production and gathering—whether it be of a rate-

making character or otherwise—is to be read into this statute, it is our conviction that this should be done by the legislature, rather than by action on the part of the administrators in apparent defiance of the plain language used by Congress in enacting this statute.

This is far from an abstruse issue of mere philosophical import. It reaches into every phase of the business of these gas producers, and would place under federal control each function of that business. If it should be contended that in the instant cause the Commission was entitled to overlook the plain language of Congress because it found it convenient to consider this company's operations overall, in fixing its rates, and if as a result this particular exception should be judicially confirmed, what is to prevent the Commission from taking the next step of holding that a purely production company is a "natural-gas company" under the Act—and fully subject to its jurisdiction—because, forsooth, its gas (sold at the well-head) finds its way eventually into the stream of interstate commerce? Once the first step is taken there will be no end, and "white" will indeed become "black," regardless of the will or intent of Congress. And if this be done (as the Commission's brief hints should be done) discrimination will at once arise as between those producers who sell gas to interstate pipelines and those who do not. This unfortunate result would do great harm to this industry, for he who would preserve the value of his production properties must refrain from making any sales to interstate pipelines. Let us not blind ourselves to these implications of the Federal Power Commission's acts and arguments.

Happily, there is an easy way out of the Commission's apparent difficulty. This is by the adoption in its rate-making proceedings of the allowance in the operating expenses of the natural-gas companies that are unquestionably under its jurisdiction of the "fair field price" or fair market value, as a commodity, of the gas which finds its way into their transmission lines for interstate transportation and

subsequent sale. If the producer and the final transporter are separate companies and act wholly at arm's length, this is precisely what would happen were this Commission to operate as do other rate regulatory bodies. It is as if the gas were coal purchased by an electric generating company, or pencils bought for its office, or—indeed—labor which it employs in its operations.

So long as the transaction is fair, and the price paid for the gas, or coal, or pencils, or labor is a fair price, every aim of proper rate-making is appropriately fulfilled by such action. And the allowance of a fair amount for such gas, as a commodity, offers the simple, and, we believe, the sound solution of its problem to this agency.

In the ordinary case of a sale at arm's length by separate entities, the price fixed for the gas in question may reasonably be presumed to be its fair market value, as a commodity, in the field. Should there be any doubt or suspicion on this point, the Commission is clearly not left helpless, for it may of course examine into the situation, and if the price be found to be exorbitant, under all the circumstances, it may provide for the allowance, *in the transportation company's operating expense*, of only that sum which would be the fair market price. This is as true of gas so purchased as it is of coal or any other commodity used in the regulated business.

And where "affiliation" is involved, the sole difference is that the burden might be shifted to the contracting parties to prove that the price in question is a fair price for the gas, as a commodity, in the gas field under consideration and at the time the sale in question is being made. Here again, recognized principles of administrative operation apply, and the rights and interests of the Commission as well as of the public and of the regulated company and its vendor are fully preserved by the power to fix the reasonable operating expense to be allowed for such purchases of gas in fixing the rates of the vendee, the interstate transporter.

The instant cause is but one step removed from such a situation. Here both the producing and the transporting

facilities are owned by the same entity. Yet here, also, the reasonable price of gas, as a commodity, in the field in question, and at the time the gas is put into the transmission lines, represents the fair allowance of operating expense for this commodity. We shall discuss this subject more fully in the next subdivision of this brief, but at this point we believe the above series of illustrations is of import, since it discloses how readily the Commission's apparent difficulty can be solved without in anywise doing violence to the statute, or to the will of Congress as expressed in the exemption of production and gathering from Federal Power Commission jurisdiction.

Were any other principle to be adopted, we would inevitably witness the fixing and allowance of a multiplicity of different prices for the gas of different companies (some only producers, some "affiliated" with transporters, and some both producers and transporters), though the gas be produced in the same field and at the same time. Any course which involves a procedure other than the allowance of the "fair field price," as an operating expense of the transporter, will inevitably serve only to penalize the more efficient or those who, by early entrance into the field or otherwise, have been able to obtain leases on a less costly basis than the later comers. The considerations outlined in the next subdivision of this brief, will—we believe—disclose that such a course in respect to this particular business, is emphatically not in the public interest.

III. Assumption of Jurisdiction by the Commission over Production and Gathering Has a Direct Effect Upon the Value of Natural Gas in the Field.

The Commission seems firmly and apparently irrevocably committed to a practice and policy, in rate cases arising under the Natural Gas Act, of a determination of "cost" rather than "value," even in respect to production property such as gas leaseholds. In the case under review, the

Commission gave no consideration whatever to Canadian's uncontradicted evidence that the market value of its leaseholds (excluding wells) amounted to over $15,000,000 (Ex. 181; R., V. 6, 3181-3254). Instead, the Commission found the depreciated cost of the leaseholds to be a sum less than $1,000,000, based upon the testimony of its own staff witness (Ex. 146, p. 62-64; R. V. 5, 2717-2721; R., V. 1, 186). This was the only amount included in Canadian's rate base for gas leaseholds.

The Commission also failed to give any weight whatever to testimony concerning the fair market value of gas, as a commodity, at the well-head in the Panhandle (Texas) Gas Field, although the record contains ample evidence to the effect that such market value ranges from 3.6 cents to 4 cents per thousand cubic feet. There is also evidence in the record to the effect that the market value of Canadian's gas at the end of its gathering line is approximately 7 cents per thousand cubic feet (R., V. 6, 3255-3281).

The inevitable consequence of following the Commission's cost theory in respect to production property is to lower the field prices of natural gas to an extent which may prevent or greatly curtail exploratory operations for the discovery of new sources of gas supply.[1] As was so forcefully

[1] In the 1943 Report of the Committee on Natural Gas, Section of Mineral Law, American Bar Association, it was stated that: "The Mineral Law Section is interested primarily in problems of production. Regulation of a public utility character concerns the Public Utility Section. However, the effect on production of the Natural Gas Act deserves study. Especially worthy of attention is the attitude of the Commission toward its jurisdiction over production and gathering. The mere contemplation of Federal Power Commission regulation of the well-mouth price of gas which finds its way into interstate commerce makes thousands of individual producers shudder. The principles of cost, adopted by the Commission in its rate-fixing activities would eliminate forever discovery value, would limit the financial recovery to cost plus 6½ per cent and take away all incentives to wildcat operations. Losses incurred in unsuccessful projects could not be balanced out against the cost of other and different successful projects.

and cogently pointed out by Mr. Justice Jackson in his separate opinion (concurred in by Mr. Justice Frankfurter) in the *Hope case, supra,* the natural gas business is wholly unlike ordinary public utility services such as are involved in railroad, bus, steamship, communication, electric or manufactured gas operations. Natural gas is an exhaustible resource, the supply of which can only be replenished by a continuous process of new discoveries, and Mr. Justice Jackson aptly observed in the *Hope case* "the wealth of Midas and the wit of man cannot produce or reproduce a natural gas field" (320 U.S., at p. 629). In that case, the Company did not make any claim for the "value" of its leaseholds, but relied instead only upon their cost (320 U.S., at p. 645), and did not dispute the action of the Commission in including its production and gathering operations within the scope of the rate proceeding. On the other hand, in the instant case, Canadian has throughout the proceedings, before the Commission and the Circuit Court, earnestly contended that the Commission erred when it considered Canadian's production and gathering operations and dealt with them as it did. In addition, Canadian offered uncontradicted evidence in respect to the value of its leaseholds and the fair market value of the gas in the field. Mr. Justice Jackson's comments in the *Hope case* in respect to a correct approach to the determination of field prices for natural gas, appear particularly pertinent to the instant case, and we deem it fitting to quote from them at some length. Among other things, he said (320 U.S., at p. 647 et seq.):

> "Hope's business has two components of quite divergent character. One, while not a conventional common-carrier undertaking, is essentially a transportation enterprise consisting of conveying gas from where it is

---

Two wells each costing the same but one producing twice as much as the other would result in the price of gas from one well being twice that of the other. It is not too much to say that the economic incentive for the small producer engaged in widely separated projects would be gone."

produced to a point of delivery to the buyer. This is a relatively routine operation not differing substantially from many other utility operations. The service is produced by an investment in compression and transmission facilities. Its risks are those of investing in a tested means of conveying a discovered supply of gas to a known market. A rate base calculated on the prudent investment formula would seem a reasonably satisfactory measure for fixing a return from that branch of the business whose service is roughly proportionate to the capital invested. But it has other consequences which must not be overlooked. It gives marketability and hence 'value' to gas owned by the company and gives the pipeline company a large power over the marketability and hence 'value' of the production of others.

"The other part of the business—to reduce to possession an adequate supply of natural gas—is of opposite character, being more erratic and irregular and unpredictable in relation to investment than any phase of any other utility business. A thousand feet of gas captured and severed from real estate for delivery to consumers is recognized under our law as property of much the same nature as a ton of coal, a barrel of oil, or a yard of sand. The value to be allowed for it is the real battleground between the investor and consumer. It is from this part of the business that the chief difference between the parties as to a proper rate base arises.

"Is it necessary to a 'reasonable' price for gas that it be anchored to a rate base of any kind? Why did courts in the first place begin valuing 'rate bases' in order to 'value' something else? The method came into vogue in fixing rates for transportation service which the public obtained from common carriers. The public received none of the carriers' physical property but did make some use of it. The carriage was often a monopoly so there were no open market criteria as to reasonableness. The 'value' or 'cost' of what was put to use in the service by the carrier was not a remote or irrelevant consideration in making such rates. Moreover the difficulty of appraising an intangible service was thought to be simplified if it could be related to physical property which was visible and measurable

and the items of which might have market value. The court hoped to reason from the known to the unknown. But gas fields turn this method topsy turvy. Gas itself is tangible, possessible, and does have a market and a price in the field. The value of the rate base is more elusive than that of gas. It consists of intangibles—leaseholds and freeholds—operated and unoperated—of little use in themselves except as rights to reach and capture gas. Their value lies almost wholly in predictions of discovery, and of price of gas when captured, and bears little relation to cost of tools and supplies and labor to develop it. Gas is what Hope sells and it can be directly priced more reasonably and easily and accurately than the components of a rate base can be valued. Hence the reason for resort to a roundabout way of rate base price fixing does not exist in the case of gas in the field.

"But if found, and by whatever method found, a rate base is little help in determining reasonableness of the price of gas. Appraisal of present value of these intangible rights to pursue fugitive gas depends on the value assigned to the gas when captured. The 'present fair value' rate base, generally in ill repute, is not even urged by the gas company for valuing its fields.

"The prudent investment theory has relative merits in fixing rates for a utility which creates its service merely by its investment. The amount and quality of service rendered by the usual utility will, at least roughly, be measured by the amount of capital it puts into the enterprise. But it has no rational application where there is no such relationship between investment and capacity to serve. There is no such relationship between investment and amount of gas produced. Let us assume that Doe and Roe each produces in West Virginia for delivery to Cleveland the same quantity of natural gas per day. Doe, however, through luck or foresight or whatever it takes, gets his gas from investing $50,000 in leases and drilling; Roe drilled poorer territory, got smaller wells, and has invested $250,000. Does anybody imagine that Roe can get or ought to get for his gas five times as much as Doe because he has spent five times as much? The service one renders to

society in the gas business is measured by what he gets out of the ground, not by what he puts into it, and there is little more relation between the investment and the results than in a game of poker.

"Two-thirds of the gas Hope handles it buys from about 340 independent producers. It is obvious that the principle of rate-making applied to Hope's own gas cannot be applied, and has not been applied, to the bulk of the gas Hope delivers. It is not probable that the investment of any two of these producers will bear the same ratio to their investments. The gas, however, all goes to the same use, has the same utilization value and the same ultimate price.

"To regulate such an enterprise by undiscriminatingly transplanting any body of rate doctrine conceived and adapted to the ordinary utility business can serve the 'public interest' as the Natural Gas Act requires, if at all, only by accident. Mr. Justice Brandeis, the pioneer juristic advocate of the prudent investment theory for man-made utilities, never, so far as I am able to discover, proposed its application to a natural gas case. On the other hand, dissenting in *Pennsylvania* v. *West Virginia*, he reviewed the problems of gas supply and said, 'In no other field of public service regulation is the controlling body confronted with factors so baffling as in the natural gas industry; and in none is continuous supervision and control required in so high a degree.' 262 U.S. 553, 621. If natural gas rates are intelligently to be regulated we must fit our legal principles to the economy of the industry and not try to fit the industry to our books.

"As our decisions stand the Commission was justified in believing that it was required to proceed by the rate base method even as to gas in the field. For this reason the Court may not merely wash its hands of the method and rationale of rate making. The fact is that this Court, with no discussion of its fitness, simply transferred the rate base method to the natural gas industry. It happened in *Newark Natural Gas & Fuel Co.* v. *City of Newark, Ohio*, 242 U.S. 405 (1917), in which the company wanted 25 cents per m.c.f., and

under the Fourteenth Amendment challenged the reduction to 18 cents by ordinance. This Court sustained the reduction because the court below 'gave careful consideration to the questions of the value of the property at the time of the inquiry,' and whether the rate 'would be sufficient to provide a fair return on the value of the property.' The Court said this method was 'based upon principles thoroughly established by repeated decisions of this court,' citing many cases, not one of which involved natural gas or a comparable wasting natural resource. Then came issues as to state power to regulate as affected by the commerce clause. *Public Utilities Commission* v. *Landon*, 249 U.S. 236 (1919); *Pennsylvania Gas Co.* v. *Public Service Commission*, 252 U.S. 23 (1920). These questions settled, the Court again was called upon in natural gas cases to consider state rate-making claimed to be invalid under the Fourteenth Amendment. *United Fuel Gas Co.* v. *Railroad Commission of Kentucky*, 278 U.S. 300 (1929); *United Fuel Gas Company* v. *Public Service Commission of West Virginia*, 278 U.S. 322 (1929). Then, as now, the differences were 'due chiefly to the difference in value ascribed by each to the gas rights and leaseholds.' 278 U.S. 300, 311. No one seems to have questioned that the rate base method must be pursued and the controversy was as to what rate base must be used. Later the 'value' of gas in the field was questioned in determining the amount a regulated company should be allowed to pay an affiliate therefor—a state determination also reviewed under the Fourteenth Amendment. *Dayton Power & Light Company* v. *Public Utilities Commission of Ohio*, 292 U.S. 290 (1934); *Columbus Gas & Fuel Co.* v. *Public Utilities Commission of Ohio*, 292 U. S. 398 (1934). In both cases, one of which sustained, and one of which struck down a fixed rate the Court assumed the rate base method, as the legal way of testing reasonableness of natural gas prices fixed by public authority, without examining its real relevancy to the inquiry.

"Under the weight of such precedents we cannot expect the Commission to initiate economically intelligent methods of fixing gas prices. But the Court now

faces a new plan of federal regulation based on the power to fix the price at which gas shall be allowed to move in interstate commerce. I should now consider whether these rules devised under the Fourteenth Amendment are the exclusive tests of a just and reasonable rate under the federal statute, inviting reargument directed to that point if necessary. As I see it now I would be prepared to hold that these rules do not apply to a natural gas case arising under the Natural Gas Act.

"Such a holding would leave the Commission to fix the price of gas in the field as one would fix maximum prices of oil or milk or coal, or any other commodity. Such a price is not calculated to produce a fair return on the synthetic value of a rate base of any individual producer, and would not undertake to assure a fair return to any producer. The emphasis would shift from the producer to the product, which would be regulated with an eye to average or typical producing conditions in the field.

"Such a price fixing process on economic lines would offer little temptation to the judiciary to become back seat drivers of the price fixing machine. The unfortunate effect of judicial intervention in this field is to divert the attention of those engaged in the process from what is economically unwise and self-defeating limits before they would reach constitutional ones. Any constitutional problems growing out of price fixing are quite different than those that have heretofore been considered to inhere in rate making. A producer would have difficulty showing the invalidity of such a fixed price so long as he voluntarily continued to sell his product in interstate commerce. Should he withdraw and other authority be invoked to compel him to part with his property, a different problem would be presented.

"Allowance in a rate to compensate for gas removed from gas lands, whether fixed as of point of production or as of point of delivery, probably best can be measured by a functional test applied to the whole industry. For good or ill we depend upon private enterprise to

exploit these natural resources for public consumption. The function which an allowance for gas in the field should perform for society in such circumstances is to be enough and no more than enough to induce private enterprise completely and efficiently to utilize gas resources, to acquire for public service any available gas or gas rights and to deliver gas at a rate and for uses which will be in the future as well as in the present public interest."

Several of the large natural gas producing states are today attempting to obtain an increased value for the natural gas resources in their respective states. This Court is intimately familiar with the contentions raised by the State of West Virginia in the recent *Hope case*. It appears that the Railroad Commission of Texas, the gas regulatory body in the largest gas-producing state in the nation, also advocates a larger market and a higher price for its natural gas, for counsel for that Commission, in a certificate proceeding before the Federal Power Commission (*In the Matter of Memphis Natural Gas Company*, Opinion No. 119, quoted at p. 21) recently stated that:

> "We are great marketers of natural gas in Texas and we feel that the better the market, the larger the market, the better the price, and the better the price, the easier it is to prevent physical waste of natural gas, because then you have landowners and everyone else undertaking to prevent waste and hold it down."

It is certainly logical to contend that Congress, when it exempted production and gathering from the provisions of the Act, intended to leave the price of natural gas in the field to be determined by economic and competitive factors rather than by regulation on an individual "cost" basis by the Commission. It is well known that the acquisition of leaseholds and the sale therefrom of natural gas is generally a highly competitive business. Such competition will ordinarily establish a "going" price for natural gas in the

field, as a commodity, and to that extent extraneous regulation would be rendered unnecessary. Congress, when it enacted the Natural Gas Act, had before it a full report from the Federal Trade Commission on the natural gas industry, which was referred to in Section 1(a) of the Act. In this report, the Federal Trade Commission commented that the "field price is based upon competition rather than a real cost-plus basis," and it was cogently added that there is "no positive relationship between costs of drilling wells and the selling price of gas." (Sen. Doc. No. 92 Part 84-A, p. 132, 70th Cong., 1st Sess.)

Indeed, Mr. Dozier Devane, then Solicitor of the Federal Power Commission, stated at the Congressional hearings on the legislation here in question that in this Act "there is no control of the gathering rate; the Commission would not have jurisdiction. *That price is fixed by competitive conditions that exist in the field.*" (Hearings on H.R. 11662, House Committee on Interstate and Foreign Commerce, 74th Cong., 2nd Sess., pp. 42-43).

Under the rulings which the Commission has consistently made in natural gas rate proceedings, however, "cost" testimony alone is considered to be relevant in the determination of field prices of natural gas. Such a cost theory, we submit, is entirely unsuited to the natural gas production business, as was pointed out by Mr. Justice Jackson in his separate opinion in the *Hope case*. Unless this Court should now correct the action of the Commission in this proceeding, the same erroneous "cost" theory will unquestionably continue to be applied by the Commission, to the serious detriment of producers of natural gas, to the detriment of the interests of natural gas producing states, and of the proper conservation of natural gas.

In view of the specific language used by the Congress in Section 1(b) of the Natural Gas Act, as recognized both in the majority and minority opinions of this Court in the *Hope case* where it was said that "the Federal Power Commission was given no authority over 'the production or

gathering of natural gas'" (320 U. S. at pp. 610 and 612), it would seem appropriate, and indeed necessary, for this Court to rule (now that the issue is for the first time squarely before it) that Congress meant precisely what it said in respect to production and gathering, and that the Commission has exceeded its statutory authority in this proceeding. Such a ruling would restore the Natural Gas Act, and the Commission's jurisdiction thereunder, to the proper sphere contemplated by Congress.

IV. The Curious Argument that the Commission's Action Really Does Not Constitute Regulation of Production or Gathering.

The Federal Power Commission was at least forthright. It said that it was "indispensable" for it to cover all of this company's production and gathering properties into the rate base, and all of its production and gathering operations into the operating expense allowances. And, of course, the production and gathering elements figured therefore in the allowed revenues or "return." The Commission did all this frankly and openly, with neither compunction nor dissimulation. It simply included production and gathering, along with transportation, and declared that it did this because these operations were "integrated," and because it saw no way out other than to proceed as it did, apparently regardless of the statute. Such action, it declared, was "indispensable."

The Circuit Court of Appeals, on the other hand, admitted that the Commission is without power to regulate either the operations of production and gathering or the rates therefor. But, said the Court, the Commission didn't really do that, because it didn't fix separate rates for production or for gathering, or for the gas at the conclusion of those operations and at the inception of transportation, but rather merely lumped everything together and fixed rates only for gas at the conclusion of the transportation. Therefore, said

the Court, the Commission did not exercise a jurisdiction or power prohibited by the statute.

We are confronted therefore with a case where (1) the company says "You have exercised a prohibited power. You have taken jurisdiction over our production and gathering operations, and in truth and effect you have fixed rates therefor. This is contrary to the law"; (2) the Commission says, "We had to do it—just couldn't see how we could get around it," and (3) the Circuit Court says, "The Commission can't regulate production and gathering, and it can't make rates for production and gathering. But in this case it didn't really do that,—it merely added up all the company's operations, including those of production and gathering, and fixed a rate for gas at the end of the pipeline. That wasn't prohibited."

Frankly, this situation seems to us much like the old Mexican shell game—now you see the pea, and now you don't. The Commission cannot regulate production and gathering or make rates for gas merely produced and gathered; but it may accomplish the same end, in effect and in truth and fact, by considering the production and gathering as a part of the transportation, over which it does have rate-making power, and by merely fixing the rate for the gas at the conclusion of the entire train of operations.

Let us analyze this curious situation, first under ordinary and usual regulatory and administrative principles, and then in the light of the particular nature of the natural gas business. We believe that in both instances a similar conclusion must be reached. In any event, it should not prove difficult,—certainly not impossible,—to locate the pea under the right shell, and at least we may be pardoned for trying.

First, what is it that a regulatory body does when it fixes the rates to be charged by a regulated entity? If it appropriately follows this Court's injunctions, it seeks first to determine the fair allowance by way of "return" which the company should be permitted to earn as a result of the

services rendered or the commodities sold, and then it endeavors to establish a reasonable "spread" of rates (for the different services offered to different classes of patrons) which will—overall—produce such appropriate return. The vital element is the establishment of allowable "return." If a company is engaged in two businesses, one subject to regulation and the other not, or if it is engaged in both intrastate and interstate business, only one of which is subject to regulation by the Commission in question, the regulatory body may not lump everything together and because of some supposed difficulty of segregation fix the rates for all willy-nilly. On the contrary, it must "separate" the one from the other, and then proceed to determine the proper rates for the service over which it has jurisdiction, as if that were an entirely separate and distinct business. It considers the rate base in that phase of the business, its proper operating expenses and the "return" which would be fair. If the company is losing money in the other (unregulated) phase of its business, it cannot expect to make up those losses by loading them onto the patrons of its regulated services. Nor, if it is making large returns from that other business, can the patrons of its regulated operations expect to obtain their services at otherwise unduly low rates, or possibly free. The two phases of operation must be treated separately.

These principles are universally recognized. In the complex field of telephone service, this Court brought them into play in the *Lindheimer case*,[1] in which a fair "separation" of intra from interstate property, expense and revenue was required before judging the fairness of certain intrastate rates fixed by a state commission. And in such instances as the ownership by a regulated corporation of both a hotel and a motor bus line, and an infinitude of others, the identical principle is necessarily applied. Before the primary

[1] See *Lindheimer* v. *Illinois Bell Telephone Co.*, 292 U. S. 151, and related decisions. *Smith* v. *Illinois Bell Telephone Co.*, 282 U. S. 133, and *Illinois Bell Telephone Co.* v. *Gilbert*, 3 F. (Supp.) 595.

function of determining the proper allowable "fair return" for the regulated portion of such a business can be performed, the regulatory body must fairly and reasonably separate out the properties and the expenses of the phase of the overall corporate operations over which it has jurisdiction. In no other manner can it lawfully or properly exercise its regulatory functions.

Nor could it with logic or propriety say, "We know we have no regulatory power over the charges to be made for the hotel services of this company when we fix its motor bus rates, but we just can't somehow seem to segregate the two, so we will deem it 'indispensable' to lump them together and then we will fix an overall fair return. Of course, we'll actually establish by order only the motor bus rates, but since the hotel is paying nicely we can fix the rates to bus patrons very low and still the company will earn enough overall to keep its head above water." No one would be found to support such a plan or program.

But it may be argued that natural gas is a commodity that is sold, rather than a service that is rendered, and that this fact somehow takes the case out of the general principle. Let us test this proposition. Suppose a natural gas field with ten wells, each capable of producing a million cubic feet of gas per day. The ten separate owners of these wells have each sought a market for their gas, and by the balancing operation of supply and demand a well-recognized "field price" has come into play in this field. All other things being equal, no such owner could hope to sell his gas for more—at least not much more—than this established field price. And certainly he would not sell it for a lower price, unless for some reason of lack of quality or pressure or because of his well's location he could not find a purchaser at the going rate. A pipeline company seeking a source of supply would be perfectly justified in contracting to buy gas in that field at that rate, and in the regulation of its charges to its patrons (after transportation to a distant

market) the properly allowable expense for gas so purchased would be that going rate.

And this would be true irrespective of the individual costs to the well owners of their leases and well properties, though these costs might—and doubtless would—have varied considerably, depending on when they entered the field and whether drilling costs were up or down when they sank their particular wells. A "cost plus" allowance system, if adopted by some short-sighted regulatory body, would result only in confusion, a multiplicity of different rates in the same gas field, and—in the end—in much harm to the public interest, even if if possessed jurisdiction so to do.

The situation is the same if one of the producers and gatherers is the pipeline company itself. To require that its own gas go into the pipeline on a "cost plus" basis, while gas from other producers enters the line on a market price basis could not fail, in the end, to produce confusion and harm to the public interest. Yet this is exactly what the Commission did in the instant case. And the fact that gas is a commodity, rather than a service, not only does not alter the need for a fair "separation" of functions in the fixing of rates, but particularly emphasizes the essentiality of such action, and for the taking into the transmission line of produced and gathered gas (regardless of who did the producing and gathering) at the fair commodity price of such gas in the field, plus a fair amount for the gathering of the gas.

The Commission would of course have to make this segregation if this company sold a portion of its produced and gathered gas in the state of its production, and the remainder went into the channels of interstate commerce. (As, indeed, we understand is the fact with respect to Canadian.) And we apprehend that no one would suggest this this Federal Commission could avoid such segregation upon some imagined "indispensability" of lumping all of the company's operations together when fixing the rates for its interstate business. The case is similar with respect to these operations of production and gathering, which Con-

gress has excepted from this Commission's powers as fully as the company's intrastate sales and operations are excepted by virtue of the Federal Constitution. It is no more difficult to make the one segregation than it is the other,—in fact, the segregation of production and gathering is much more simple, since the effective "short cut" of using the fair field price of the gas, as a commodity, at the inception of transportation is here available to the regulatory body. When a proper "separation" has been made, the regulated phase of the business is readily considered and dealt with by the regulatory body, whether the operation be that of a service or that of a sale of a commodity, while the laws of supply and demand are left to play their part with the remainder, just as if it were in fact operated by a distinct entity.

The case now before the Court presents just such a situation. Here Congress has vested certain rate regulatory jurisdiction in the Federal Power Commission, but in the same breath it has declared that such power shall not go to the operations of production and gathering. If this were a case of two distinct types of service, one subject to regulation and the other not, the necessity for a reasonable segregation of properties, expense and revenue in respect to the two in the fixation of rates for the regulated service would be obvious. It seems no less obvious where the two functions deal with a commodity. If the functions of transportation, on the one hand, were performed by an entity entirely separate and distinct from that which performs those of production and gathering, the going market price of gas at the inception of transportation would obviously be the proper allowance for the gas there purchased, as an operating expense. *And a different allowance where the several functions are operated by a single entity cannot possibly be other than a direct "regulation" of the functions over which jurisdiction has not been granted.*

Here, then, is the shell under which lies the pea. It is idle to say that, merely because specific, separate rates have not been fixed—as such—for production or gathering, the Commission has not effectively exercised rate-making

functions over those operations. For, in effect, the Commission by its action in this case has fixed rates at the inception of transportation as fully and as completely as if it had set them out in black and white. By not adopting the fair market price of the gas, as a commodity, at that point, it has accomplished precisely that exact effect.

Indeed, the fallacy of the Circuit Court's position seems readily demonstrable. It declared that the Commission could not fix this company's rates in respect to its production and gathering operations, but it reasoned that, since the Commission's final rate order set forth only rates to be charged at the conclusion of transportation, the production and gathering rates were not fixed, though the production and gathering properties and expenses were lumped into the figures used in developing the rates which were fixed. The test must be whether this operation established, as one of its necessary effects, the values and amounts at which the produced and gathered gas goes into the transportation system. If that gas had been separately owned and had been purchased by the transporting company at the inception of transportation, the rate base would have included only the transportation properties, and the allowable expenses would have been those of the transportation only, plus the price paid for the gas where it entered the transportation pipeline. And if, in the present case, the Commission had dealt only with the company's transportation properties in establishing the rate base, and had developed only the company's transportation costs in finding operating expenses, it would then have had to adopt—and "fix"—an amount to be allowed for the produced and gathered gas at the inception of transportation. Had this been stated by it separately, no one would doubt but that it had, in effect, "fixed rates for production and gathering."

The Commission's adopted method had this precise necessary effect. It did not state this amount separately, but it lumped everything into one pot and applied a single formula to all,—i. e., it allowed a return of 6½% on the entire rate base, plus overall operating expenses. If we now

subtract from the rate base the amounts covering transportation properties and the expenses attributable to transportation, we find that—under the formula—a certain return was allowed for such operation. The remainder is the rate base fixed for production and gathering properties, and the expenses incident to production and gathering, and—under the formula—the return allowed on such operations.

The making of rates is primarily a process of the ascertainment of reasonably allowable earnings,—the so-called "fair return" of a regulated enterprise. Once this figure is ascertained, the actual individual rates to be charged are largely developed by mere mathematical processes. Here the Commission unquestionably developed, used and promulgated a "return" applicable to the production and gathering operations. To say that production and gathering rates were not "fixed," because the schedule of rates actually set up was for charges after transportation had been performed, including production and gathering, is to blind one's eyes to solid fact. Those rates were in part rates for production and gathering as fully and completely as if they had been stated in two parts. We earnestly submit that the Circuit Court merely begged the question, and erred in fact and in law when it said that the Commission did not in this case fix rates for production and gathering.

The real question is how much shall properly be allowed, over and above the expenses of transportation, for the gas taken into the transmission pipeline. Any lumping of everything together necessarily "fixes a rate" for such gas. And if the exemption of production and gathering from the Commission's jurisdiction means anything, it must mean that such overall action is prohibited. Should fraud, undue influence, unfairly high prices or other similar factors be found to be present, where the producer and the transporter are separate entities, the Commission may deal with the situation through its power to allow, as an operating expense, only the fair market value of purchased gas,

as a commodity. And in cases where the producer and the transporter are the same entity, this same simple principle should be applied.

The Circuit Court therefore erred in its pronouncement in this case to the effect that, though the fixing of production and gathering rates was not a prerogative of the Federal Power Commission, that body had not by its action in respect to this company contravened the statute by exercising a prohibited jurisdiction.

CONCLUSION.

Finally, the Independent Natural Gas Association of America suggests that the problem which is considered in this brief is essentially a relatively simple issue. If, as we believe, jurisdiction over production and gathering has been wholly withheld from the Federal Power Commission, and if, as we further believe, such lack of jurisdiction is all-embracing, the Commission is not faced with an insoluble problem, nor is it "indispensable" for it to commit intellectual mayhem on the statute, as it seemingly did in the instant proceeding. In a case of "integrated" operations, such as this, the allowance as an operating expense of a fair field price for gas at the point of its entrance into the transmission system (i. e., after the conclusion of production and gathering), and the omission of production and gathering properties from the "rate base" and of production and gathering expense from operating expenses, would protect every legitimate interest of the company, the Commission and the public. In the case of separately owned and operated production and gathering properties, this is precisely what would occur, and in the light of the limitation on jurisdiction contained in the Act, this seems to represent a sound, overall policy for universal application.

Moreover, even were it to be held that the Commission's contention is correct to the effect that sales from the wellhead or from a gathering system, when the gas so sold is eventually transported by the vendee to and sold by it in

another state, are "sales in interstate commerce," and are therefore committed to the Commission for regulation, no alteration of the principle just mentioned would apparently be either necessary or justified. As Mr. Justice Jackson has so cogently explained, in his separate opinion in the *Hope case*, natural gas is a unique commodity, and the use of a fair field price at the commencement of transportation represents the soundest method of handling this difficult regulatory problem. Under such a program, production and gathering properties and expenses would simply not be considered, but the going rate for gas in the field would be allowed as an operating expense. On the other hand, if it should be felt that the production and gathering properties should, for any reason, be included in the rate base, then they should be included at their current field values. Only thus may the economic issues which surround the resolution of this problem be fairly and reasonably subserved. This is no mere "Smyth v. Ames" issue. It is far more fundamental than that. It relates not only to the statutory limits of this regulatory body's powers, but also to the basic economy of the entire natural gas industry.

Appropriate judicial determination of this issue of production and gathering jurisdiction, and of the scope of the Federal Power Commission's authority in respect to such operations, is particularly essential at this time. The Commission, in recent pronouncements, and in its brief before the Circuit Court in this proceeding, has apparently taken the position that, despite the express exemption of production and gathering from the purview of the Natural Gas Act, it should assume at least certain powers over such operations in all instances in which gas sold by producers or gatherers is eventually transported in interstate commerce by the vendee. Yet on December 30, 1944, the Commission wrote to Governor Andrew F. Schoeppel (of Kansas), Chairman of the Interstate Oil Compact Commission, that it "has no desire to extend its jurisdiction to cover the production of natural gas or *otherwise* invade

what are properly regarded as the functions of the conservation authorities of the several states," and that "the Commission has no desire to interfere with the several states in the full and effective exercise of their authority regarding either the production or local distribution of natural gas." (Release No. 2607 (G-700) for publication on January 3, 1945.)

Reconcilement of these apparently conflicting expressions seems impossible on any reasonable basis, since the regulation of production and gathering which was undertaken in the instant proceeding (through the allowance of "cost" only, rather than the fair field price, or value of the produced gas, as a commodity) could hardly fail to impinge on the local situation through its effect on field prices and thus upon conservation practices. The members of the Independent Natural Gas Association of America therefore believe it essential that the issue be soundly resolved at this time, and because the intent and will of Congress seems so clearly expressed in this statute, it is respectfully submitted that the judgment of the Circuit Court of Appeals in this cause should be reversed, on the ground that that Court erroneously determined that the Federal Power Commission did not exercise prohibited jurisdiction over Canadian's production and gathering operations, and on the further ground that, even if such exercise of jurisdiction was not in fact prohibited, its exercise was improper, unlawful, and in contravention of this company's rights under the Federal Constitution.

Respectfully submitted,

Independent Natural Gas Association of America,
amicus curiae,

CARL I. WHEAT,
ROBERT E. MAY,
520 Shoreham Building,
Washington 5, D. C.,
Attorneys for said
amicus curiae

January 8, 1945.

APPENDIX.

The pertinent provisions of the Natural Gas Act of 1938, c. 556, 52 Stat, 821 (15 U.S.C. 717 et seq.), are as follows:

SECTION 1. (a) As disclosed in reports of the Federal Trade Commission made pursuant to Senate Resolution 83 (Seventieth Congress, first session) and other reports made pursuant to the authority of Congress, it is hereby declared that the business of transporting and selling natural gas for ultimate distribution to the public is affected with a public interest, and that Federal regulation in matters relating to the transportation of natural gas and the sale thereof in interstate and foreign commerce is necessary in the public interest.

(b) The provisions of this act shall apply to the transportation of natural gas in interstate commerce, to the sale in interstate commerce of natural gas for resale for ultimate public consumption for domestic, commercial, industrial, or any other use, and to natural-gas companies engaged in such transportation or sale, but shall not apply to any other transportation or sale of natural gas or to the local distribution of natural gas or to the facilities used for such distribution or to the production or gathering of natural gas.

SECTION 2. (6) "Natural-gas company" means a person engaged in the transportation of natural gas in interstate commerce, or the sale in interstate commerce of such gas for resale.

(7) "Interstate commerce" means commerce between any point in a State and any point outside thereof, or between points within the same State but through any place outside thereof, but only insofar as such commerce takes place within the United States.

SECTION 4. (a) All rates and charges made, demanded, or received by any natural-gas company for or in connection with the trans-

portation or sale of natural gas subject to the jurisdiction of the Commission, and all rules and regulations affecting or pertaining to such rates or charges, shall be just and reasonable, and any such rate or charge that is not just and reasonable is hereby declared to be unlawful.

(b) No natural-gas company shall, with respect to any transportation or sale of natural gas subject to the jurisdiction of the Commission (1) make or grant any undue preference or advantage to any person or subject any person to any undue prejudice or disadvantage, or (2) maintain any unreasonable difference in rates, charges, service, facilities, or in any other respect, either as between localities or as between classes of service.

(c) Under such rules and regulations as the Commission may prescribe, every natural-gas company shall file with the Commission, within such time (not less than sixty days from the date this act takes effect) and in such form as the Commission may designate, and shall keep open in convenient form and place for public inspection, schedules showing all rates and charges for any transportation or sale subject to the jurisdiction of the Commission, and the classifications, practices, and regulations affecting such rates and charges, together with all contracts which in any manner affect or relate to such rates, charges, classifications, and services.

(d) Unless the Commission otherwise orders, no change shall be made by any natural-gas company in any such rate, charge, classification, or service, or in any rule, regulation, or contract relating thereto, except after thirty days' notice to the Commission and to the public. Such notice shall be given by filing with the Commission and keeping open for public inspection new schedules stating plainly the change or changes to be made in the schedule or schedules then in force and the time when the change or changes will go into effect.

The Commission, for good cause shown, may allow changes to take effect without requiring the thirty days' notice herein provided for by an order specifying the changes so to be made and the time when they shall take effect and the manner in which they shall be filed and published.

(e) Whenever any such new schedule is filed the Commission shall have authority, either upon complaint of any State, municipality, or State commission, or upon its own initiative without complaint, at once, and if it so orders, without answer or formal pleading by the natural-gas company, but upon reasonable notice, to enter upon a hearing concerning the lawfulness of such rate, charge, classification, or service; and, pending such hearing and the decision thereon, the Commission, upon filing with such schedules and delivering to the natural-gas company affected thereby a statement in writing of its reasons for such suspension, may suspend the operation of such schedule and defer the use of such rate, charge, classification, or service, but not for a longer period than five months beyond the time when it would otherwise go into effect: *Provided*, That the Commission shall not have authority to suspend the rate, charge, classification, or service for the sale of natural gas for resale for industrial use only; and after full hearings, either completed before or after the rate, charge, classification, or service goes into effect, the Commission may make such orders with reference thereto as would be proper in a proceeding initiated after it had become effective. If the proceeding has not been concluded and an order made at the expiration of the suspension period, on motion of the natural-gas company making the filing, the proposed change of rate, charge, classification, or service shall go into effect. Where increased rates or charges are thus made effective, the Commission may, by order, require the natu-

ral-gas company to furnish a bond, to be approved by the Commission, to refund any amounts ordered by the Commission, to keep accurate accounts in detail of all amounts received by reason of such increase, specifying by whom and in whose behalf such amounts were paid, and, upon completion of the hearing and decision, to order such natural-gas company to refund, with interest, the portion of such increased rates or charges by its decision found not justified. At any hearing involving a rate or charge sought to be increased, the burden of proof to show that the increased rate or charge is just and reasonable shall be upon the natural-gas company, and the Commission shall give to the hearing and decision of such questions preference over other questions pending before it and decide the same as speedily as possible.

SECTION 5. (a) Whenever the Commission, after a hearing had upon its own motion or upon complaint of any State, municipality, State commission, or gas distributing company, shall find that any rate, charge, or classification demanded, observed, charged, or collected by any natural-gas company in connection with any transportation or sale of natural gas, subject to the jurisdiction of the Commission, or that any rule, regulation, practice, or contract affecting such rate, charge, or classification is unjust, unreasonable, unduly discriminatory, or preferential, the Commission shall determine the just and reasonable rate, charge, classification, rule regulation, practice, or contract to be thereafter observed and in force, and shall fix the same by order: *Provided, however*, That the Commission shall have no power to order any increase in any rate contained in the currently effective schedule of such natural gas company on file with the Commission, unless such increase is in accordance with a new schedule filed by such natural gas company; but the Commission may

order a decrease where existing rates are unjust, unduly discriminatory, preferential, otherwise unlawful, or are not the lowest reasonable rates.

(b) The Commission upon its own motion, or upon the request of any State commission, whenever it can do so without prejudice to the efficient and proper conduct of its affairs, may investigate and determine the cost of the production or transportation of natural gas by a natural-gas company in cases where the Commission has no authority to establish a rate governing the transportation or sale of such natural gas.

SECTION 7. (a) Whenever the Commission, after notice and opportunity for hearing, finds such action necessary or desirable in the public interest, it may by order direct a natural-gas company to extend or improve its transportation facilities, to establish physical connection of its transportation facilities with the facilities of, and sell natural gas to, any person or municipality engaged or legally authorized to engage in the local distribution of natural or artificial gas to the public, and for such purpose to extend its transportation facilities to communities immediately adjacent to such facilities or to territory served by such natural-gas company, if the Commission finds that no undue burden will be placed upon such natural-gas company thereby: *Provided*, That the Commission shall have no authority to compel the enlargement of transportation facilities for such purposes, or to compel such natural-gas company to establish physical connection or sell natural gas when to do so would impair its ability to render adequate service to its customers.

(b) No natural-gas company shall abandon all or any portion of its facilities subject to the jurisdiction of the Commission, or any service rendered by means of such facilities, without the permission and approval of the Com-

mission first had and obtained, after due hearing, and a finding by the Commission that the available supply of natural gas is depleted to the extent that the continuance of service is unwarranted, or that the present or future public convenience or necessity permit such abandonment.

(c) No natural-gas company or person which will be a natural-gas company upon completion of any proposed construction or extension shall engage in the transportation or sale of natural gas, subject to the jurisdiction of the Commission, or undertake the construction or extension of any facilities therefor, or acquire or operate any such facilities or extensions thereof, unless there is in force with respect to such natural-gas company a certificate of public convenience and necessity issued by the Commission authorizing such acts or operations: *Provided, however*, That if any such natural-gas company or predecessor in interest was bona fide engaged in transportation or sale of natural gas, subject to the jurisdiction of the Commission, on the effective date of this amendatory Act, over the route or routes or within the area for which application is made and has so operated since that time, the Commission shall issue such certificate without requiring further proof that public convenience and necessity will be served by such operation, and without further proceedings, if application for such certificate is made to the Commission within ninety days after the effective date of this amendatory Act. Pending the determination of any such application, the continuance of such operation shall be lawful.

In all other cases the Commission shall set the matter for hearing and shall give such reasonable notice of the hearing thereon to all interested persons as in its judgment may be necessary under rules and regulations to be prescribed by the Commission; and the application shall be decided in accordance with the

procedure provided in subsection (e) of this section and such certificate shall be issued or denied accordingly: *Provided, However*, That the Commission may issue a temporary certificate in cases of emergency, to assure maintenance of adequate service or to serve particular customers, without notice or hearing, pending the determination of an application for a certificate, and may by regulation exempt from the requirements of this section temporary acts or operations for which the issuance of a certificate will not be required in the public interest.

SECTION 8. (a) Every natural-gas company shall make, keep, and preserve for such periods, such accounts, records of cost-accounting procedures, correspondence, memoranda, papers, books, and other records as the Commission may by rules and regulations prescribe as necessary or appropriate for purposes of the administration of this act: *Provided, however*, That nothing in this act shall relieve any such natural-gas company from keeping any accounts, memoranda, or records which such natural-gas company may be required to keep by or under authority of the laws of any State. The Commission may prescribe a system of accounts to be kept by such natural-gas companies, and may classify such natural-gas companies and prescribe a system of accounts for each class. The Commission, after notice and opportunity for hearing, may determine by order the accounts in which particular outlays or receipts shall be entered, charged, or credited. The burden of proof to justify every accounting entry questioned by the Commission shall be on the person making, authorizing, or requiring such entry, and the Commission may suspend a charge or credit pending submission of satisfactory proof in support thereof.

SECTION 9. (a) The Commission may, after hearing, require natural-gas companies to

carry proper and adequate depreciation and amortization accounts in accordance with such rules, regulations, and forms of account as the Commission may prescribe. The Commission may from time to time ascertain and determine, and by order fix, the proper and adequate rates of depreciation and amortization of the several classes of property of each natural-gas company used or useful in the production, transportation, or sale of natural gas. Each natural-gas company shall conform its depreciation and amortization accounts to the rates so ascertained, determined, and fixed. No natural-gas company subject to the jurisdiction of the Commission shall charge to operating expenses any depreciation or amortization charges on classes of property other than those prescribed by the Commission, or charge with respect to any class of property a percentage of depreciation or amortization other than that prescribed therefor by the Commission. No such natural-gas company shall in any case include in any form under its operating or other expenses any depreciation, amortization, or other charge or expenditure included elsewhere as a depreciation or amortization charge or otherwise under its operating or other expenses. Nothing in this section shall limit the power of a State commission to determine in the exercise of its jurisdiction, with respect to any natural-gas company, the percentage rates of depreciation or amortization to be allowed, as to any class of property of such natural-gas company, or the composite depreciation or amortization rate, for the purpose of determining rates or charges.

SECTION 10. (a) Every natural-gas company shall file with the Commission such annual and other periodic or special reports as the Commission may by rules and regulations or order prescribe as necessary or appropriate to assist the Commission in the proper administration of this act. The Commission may pre-

scribe the manner and form in which such reports shall be made, and require from such natural-gas companies specific answers to all questions upon which the Commission may need information. The Commission may require that such reports shall include, among other things, full information as to assets and liabilities, capitalization, investment and reduction thereof, gross receipts, interest due and paid, depreciation, amortization, and other reserves, cost of facilities, cost of maintenance and operation of facilities for the production, transportation, or sale of natural gas, cost of renewal and replacement of such facilities, transportation, delivery, use, and sale of natural gas. The Commission may require any such natural-gas company to make adequate provision for currently determining such costs and other facts. Such reports shall be made under oath unless the Commission otherwise specifies.

SECTION 11. (a) In case two or more States propose to the Congress compacts dealing with the conservation, production, transportation, or distribution of natural gas it shall be the duty of the Commission to assemble pertinent information relative to the matters covered in any such proposed compact, to make public and to report to the Congress information so obtained, together with such recommendations for further legislation as may appear to be appropriate or necessary to carry out the purposes of such proposed compact and to aid in the conservation of natural-gas resources within the United States and in the orderly, equitable, and economic production, transportation, and distribution of natural gas.

SECTION 14 (b) The Commission may, after hearing, determine the adequacy or inadequacy of the gas reserves held or controlled by any natural-gas company, or by anyone on its behalf, including its owned or leased properties or royalty contracts; and may also, after hear-

ing, determine the propriety and reasonableness of the inclusion in operating expenses, capital, or surplus of all delay rentals or other forms of rental or compensation for unoperated lands and leases. For the purpose of such determinations, the Commission may require any natural-gas company to file with the Commission true copies of all its lease and royalty agreements with respect to such gas reserves.

SECTION 19. (a) Any person, State, municipality, or State commission aggrieved by an order issued by the Commission in a proceeding under this act to which such person, State, municipality, or State commission is a party may apply for a rehearing within thirty days after the issuance of such order. The application for rehearing shall set forth specifically the ground or grounds upon which such application is based. Upon such application the Commission shall have power to grant or deny rehearing or to abrogate or modify its order without further hearing. Unless the Commission acts upon the application for rehearing within thirty days after it is filed, such application may be deemed to have been denied. No proceeding to review any order of the Commission shall be brought by any person unless such person shall have made application to the Commission for a rehearing thereon.

(b) Any party to a proceeding under this act aggrieved by an order issued by the Commission in such proceeding may obtain a review of such order in the circuit court of appeals of the United States for any circuit wherein the natural-gas company to which the order relates is located or has its principal place of business, or in the United States Court of Appeals for the District of Columbia, by filing in such court, within sixty days after the order of the Commission upon the application for rehearing, a written petition praying that the order of the Commission be modified or set

aside in whole or in part. A copy of such petition shall forthwith be served upon any member of the Commission and thereupon the Commission shall certify and file with the court a transcript of the record upon which the order complained of was entered. Upon the filing of such transcript such court shall have exclusive jurisdiction to affirm, modify, or set aside such order in whole or in part. No objection to the order of the Commission shall be considered by the court unless such objection shall have been urged before the Commission in the application for rehearing unless there is reasonable ground for failure so to do. The finding of the Commission as to the facts, if supported by substantial evidence, shall be conclusive. If any party shall apply to the court for leave to adduce additional evidence, and shall show to the satisfaction of the court that such additional evidence is material and that there were reasonable grounds for failure to adduce such evidence in the proceedings before the Commission, the court may order such additional evidence to be taken before the Commission and to be adduced upon the hearing in such manner and upon such terms and conditions as to the court may seem proper. The Commission may modify its findings as to the facts by reason of the additional evidence so taken, and it shall file with the court such modified or new findings, which if supported by substantial evidence, shall be conclusive, and its recommendation, if any, for the modification or setting aside of the original order. The judgment and decree of the court, affirming, modifying, or setting aside, in whole or in part, any such order of the Commission, shall be final, subject to review by the Supreme Court of the United States upon certiorari or certification as provided in sections 239 and 240 of the Judicial Code, as amended (U. S. C., title 28, secs. 346 and 347).

(c) The filing of an application for rehearing under subsection (a) shall not, unless specifically ordered by the Commission, operate as a stay of the Commission's order. The commencement of proceedings under subsection (b) of this section shall not, unless specifically ordered by the court, operate as a stay of the Commission's order.

CANADIAN RIVER GAS COMPANY, A CORPORATION, *Petitioner*

v.

FEDERAL POWER COMMISSION, CITY AND COUNTY OF DENVER, COLORADO, PUBLIC SERVICE COMMISSION OF WYOMING, COLORADO-WYOMING GAS COMPANY, PUBLIC SERVICE COMPANY OF COLORADO, AND COLORADO INTERSTATE GAS COMPANY, *Respondents*.

REPLY BRIEF OF THE INDEPENDENT NATURAL GAS ASSOCIATION OF AMERICA, AMICUS CURIAE.

Respondents have advanced no new or novel arguments in their brief. However, since a sound resolution of the essential issue here presented seems so imperative from the standpoint of all concerned, and since the hazard of submergence of that primary issue in a welter of confusing detail seems in this instance to be so great, this *amicus curiae*, representing as it does many segments of the natural gas industry, deems it appropriate to make this brief reply.

The fundamental issue to be resolved in this proceeding is quite simple and may be succinctly stated. Disregarding for the moment certain collateral problems assigned by petitioner as error,[1] the essential and critical question—broadly viewed—seems to be *whether the Federal Power Commission has been vested by law with such jurisdiction over the natural gas production and gathering activities of this petitioner as to justify the particular action it took in respect to such activities in the cause now under review.*

Two distinct inquiries are involved in the resolution of this fundamental issue:

> (1) In view of the express and unconditional statutory exception of "production and gathering" from the purview of the Natural Gas Act, may the Federal Power Commission (whose authority in such matters must, of course, be discovered within the four walls of that Act) lawfully, in a rate case, comingle a natural gas pipeline company's production and gathering properties and expenses with those of its interstate transportation activities (over which the Commission has unquestioned rate regulatory power) and establish and enforce rates for gas sales at the conclusion of the act of transportation which admittedly include production and gathering factors in both rate base and expense, and which necessarily and confessedly include provision for compensation in respect to production and gathering operations in the allowed "return"?
>
> (2) If the Commission does possess such authority, did it lawfully exercise it in the proceeding under review?

It is important to recall that the Commission assumed and purported to exercise rate-making jurisdiction over "production and gathering" in this case because—as it

[1] Such, for example, as the issue of required "allocation," and the method adopted for that purported purpose by the Commission.

said—such action seemed to it "indispensable." It is equally important to recall that the Commission's counsel argued in the court below that the express statutory exception of production and gathering from the purview of the Natural Gas Act really amounts only to saying that "whenever necessary for the purposes specifically provided in subsequent sections of the Act, the Commission shall have jurisdiction over production and gathering."

The Circuit Court of Appeals found itself unable to accept this apparently topsy-turvy view of the law. It held that the Act means exactly what it says, and that the Commission possesses no authority, express or implied, dispensable or indispensable, to fix rates for petitioner's production and gathering operations. But, thought the Court, in the instant cause the Commission did not in fact do this, because the rates it actually fixed apply to petitioner's sales of gas at the conclusion of transportation. The Circuit Court so held despite the admitted comingling of petitioner's production and gathering properties, expenses and "return" in the rate-making process here followed by the Commission, and despite the significant fact that the Commission certainly thought it had acted, and did act, in such manner as to make rates which, in addition to transportation, unquestionably covered and included petitioner's production and gathering activities, and provided a factor of compensation therefor. Just how the Circuit Court managed to reach the curious conclusion that such rates were not "for production" or "for gathering," though admittedly in full compensation "for" such efforts, it left unexplained. Certainly, if the Commission's rate order should stand, petitioner could not obtain compensation for such activities in any other manner than through these rates.

In the narrow sense, therefore, if the Circuit Court's basic ruling on the law should, under well-recognized juristic principles, be deemed controlling (as "the law of the case"), and if as a result of that ruling the Commission is—without more—to be deemed not to possess power, express or im-

plied, over production and gathering rates *vis-a-vis* this petitioner, the sole issue now to be resolved is seemingly one of fact,—did the action taken by the Commission in fact constitute, in part, a fixing of rates to be charged by this petitioner, out of the proceeds of which it will secure compensation for its production and gathering efforts? There may well be no good reason why this Court should not now treat this case from this narrower viewpoint. When so viewed, we believe there exists no alternative except reversal on this issue of fact—especially since the basic ruling of the Circuit Court on the issue of law seems to be so sound and conclusive.

However, since the Commission and its counsel have taken a much broader view of the pending issues, and since their apparent position is that the exception of "production and gathering" from the purview of this statute is a wholly nugatory provision, this *amicus curiae* has deemed it appropriate to discuss the matter from its less narrow aspects. In brief we have urged:

(1) That, whether or no Congress *could* have legislated to place under federal regulation the operations of natural gas production and gathering, or the rates to be charged therefor (in instances where the gas in question eventually finds its way into the stream of interstate commerce), it is evident that *Congress did not do so*, but instead evidenced its clear intent to the contrary;

(2) That this is apparent from the unequivocal language used by Congress when it declared that the provisions of the Natural Gas Act (without exception) shall not apply to production and gathering;

(3) That the Natural Gas Act thus discloses on its face that the entire subject of production and gathering of natural gas (including, of course, the establishment of rates applicable to production and gathering operations) has been effectively excluded by Congress from the Commission's jurisdiction;

(4) That the legislative history of this statute affords ample support for this proposition, and in fact discloses that the Natural Gas Act is not reasonably susceptible of any other interpretation;

(5) *That the Circuit Court of Appeals was therefore correct in its ruling on the law in this proceeding;*

(6) That the action of the Commission in this case was in truth and fact—and, indeed, in every real respect—an act of fixing rates "for" production and gathering activities, as well as "for" gas transportation operations, and is admitted to be such by the Commission;

(7) *That the Circuit Court of Appeals was therefore wrong in its finding of fact to the effect that the Commission's action did not constitute a fixing of rates "for" production and gathering;*

(8) That the mere fact that produced and gathered gas eventually finds its way into interstate commerce cannot, of itself, form the basis of an assertion of powers which Congress, in its discretion, has specifically excluded by express statutory language;

(9) That, in particular, an assertion of such power by a regulatory body, merely because of some subjectively-assumed "necessity" or "indispensability," may not be judicially sanctioned or condoned, since to do so would be tantamount to affording to such administrative agency a free license to operate by mere whim, whenever it might declare it to be "necessary" in its sole opinion so to do,—though such action be in the very teeth of the statute which defines its powers;

(10) That if no such power here exists, its asserted exercise *vis-a-vis* this petitioner was patently unauthorized and unlawful, and must therefore be reversed, and

(11) That, in any event, even were the power to be conceded, its exercise in the cause at bar was improper

and unlawful because of the special character of the operations and of the commodity here involved.

All of which is, of course, merely to say that if—as we firmly believe—the Commission did not possess the asserted power, its action was obviously unauthorized and should be declared null and void; but further that, even if it were to be admitted that the Commission does possess the basic authority, its attempted exercise of the power in this cause was in complete disregard of "the nature of the critter" before it, and its action should therefore be reversed on that ground.

ARGUMENT.

In our opening brief we outlined the reasons which impel us to agree with the Circuit Court of Appeals' ruling that the Federal Power Commission has not been vested with power, express or implied, to fix rates for, or including, petitioner's production and gathering operations. In that connection, we examined the Natural Gas Act and its legislative history, and expressed the view that Congress not only clearly intended to except the mere physical acts of natural gas production and gathering from the purview of the Act and from the authority by that statute vested in the Commission, but that it also appears from the plain language of the Act that Congress equally clearly intended to except from the scope of the Commission's authority such rate-making functions as were attempted to be exercised in this proceeding in respect to petitioner's production and gathering activities. We also examined the action of the Commission in this proceeding, and concluded that such action was, in fact and in truth, an attempted exercise of power to fix this company's rates "for production and gathering."

We therefore urged that the Circuit Court of Appeals was right in its ruling that the Commission may not, directly or indirectly, establish petitioner's rates for production and gathering activities and services, but that the Court was obviously wrong in holding that the Commission

did not in fact essay to do that very thing in this instance. Finally, we argued that, regardless of power or jurisdiction, the nature of natural gas and of its production and gathering is such as to render unreasonable, unlawful and violative of petitioner's constitutional rights the position adopted by the Commission in this instance. We shall not repeat our opening arguments.

However, it occurs to us that it may serve a useful purpose to afford the Court with certain concrete illustrations of the results to be expected if the Commission's jurisdiction were to be sustained, and if its action *vis-a-vis* this petitioner's production and gathering activites were to be approved by this tribunal. Before doing so, we desire respectfully to reiterate our complete acceptance of the views set forth by Mr. Justice Jackson in the *Hope case*[1] (quoted at length in our opening brief) with respect to the dangers, the confusion and the topsy-turvy results to be apprehended from an acceptance of the procedure and methods adopted by the Commission in this proceeding—including the "end results" thereof. It was the view of the learned Justice that the use of "cost" of leaseholds, wells and associated facilities as a rate base cannot be justified where the production and gathering of natural gas is concerned, and we believe his discussion clearly discloses that *this is no mere Smyth* v. *Ames*[2] *issue*, but is a beast of totally different aspect.

To simplify our examples, let us assume a natural gas field whose producing area is covered by numerous gas leases, lettered A to Z, inclusive, on each of which a gas well has been drilled, and from which wells large sales of gas for divers purposes are being made, many in purely intrastate commerce. Of these leases:

---

[1] *Federal Power Commission* v. *Hope Natural Gas Company*, 320 U. S. 591. Oddly enough, respondents failed in their brief herein even to mention Mr. Justice Jackson's cogent discussion.

[2] 169 U. S. 466.

Lease A is owned by Silas Brown, whose well cost $50,000 and is capable of producing on a safe commercial basis 10,000,000 cubic feet of gas per day;

Lease B is owned by the Intrastate Drilling Company, whose well also cost $50,000 but produces only 1,000,000 cubic feet daily, and

Lease C is owned by the Interstate Commerce Gas Pipeline Company, whose well cost $50,000 and produces 5,000,000 cubic feet daily.

For simplicity let us omit "gathering" in our discussion, and assume that the Interstate Commerce company produces the gas from its own well; that it purchases the gas from Brown's and Intrastate's wells at the well-head (paying therefor the going field rate), and that it then transports the comingled gas through its trunk pipeline into another state, where it sells all of it to a distributing company which resells it to domestic, commercial and industrial consumers. Obviously, the Interstate Commerce company is by definition a "natural-gas company" under the Natural Gas Act, and the rates charged by it to the distributing company for gas sold and delivered to the latter "for resale" at the end of the interstate gas transportation operations are therefore subject to regulation by the Federal Power Commission.

Over the years a definite and well-recognized field price of gas at the well-head has come into being in this gas field, and large sales are being made at approximately such price from many wells by many leaseholders for many purposes. The basic "reasonableness" of this commercially recognized price per cubic foot of produced gas has thus been tested by the relentless operation of the law of supply and demand, and this price has necessarily been accepted by many buyers and sellers in numerous arm's-length transactions, regardless of their individual lease or well costs or relative productivity.

Under the method of production and gathering rate-making adopted by the Commission in the instant cause, the Commission would allow to the Interstate company, as expense of purchased gas, the amounts paid by it to Brown and the Intrastate company (at the going field rate) for the gas purchased from them, but would allow as expense only the cost to the Interstate company of the gas produced by it from its own well. Thus the allowance for gas entering Interstate's pipeline would be one amount for the gas from Brown's and Intrastate's wells, and another for that from Interstate's neighboring well.[1] And oddly enough the Commission would apparently apply its "cost of production" method to any gas purchased by Interstate from another "natural gas company" (say from "Lease D" in the assumed field), even though it were purchased at that concern's well-head, and even where that company's gas transportation activities (under the Commission's unquestioned jurisdiction) were wholly separate from that well and did not draw therefrom, or even

[1] This was exactly what was done on a large scale by the Commission in respect to the Panhandle Eastern Pipe Line Company (whose appeal of the Commission's order—No. 296, this term—is on argument in this Court concurrently with the instant cause). Of course, if such a natural gas company's costs per cubic foot of self-produced gas were greater (rather than less than) the fair, going field price at which it was purchasing some of its gas from others, the Commission would find it difficult, if not impossible—even if it so desired—to be consistent and to allow such higher cost for the company's self-produced gas in establishing the production factors in its rates. Many good reasons would doubtless at once occur to the Commission why it should not (and could not) do this, for to do so would be to afford a bonus to inefficiency or lack of foresight. Thus what is sauce for the goose would not for long remain sauce for the gander, and there would be left outstanding only the penalty for efficiency and foresight. The Commission's method simply cannot be anything but such a one-way road.

if they were from a totally different gas field.[1] (We shall later see why even Brown's and Intrastate's sales are in the penumbra of this process of accretion of power by the Commission.)

Moreover, if leases A, B and C were owned by three separate "natural-gas companies" under the Commission's jurisdiction, and if their respective interstate pipeline transportation expenses were precisely similar, the rates which could be charged for their gas at the end of the transportation—under the cost-of-leaseholds-and-production-facilities method adopted by the Commission in the instant cause—would obviously vary tremendously. In fact, under our cost and productivity assumptions, the production factors of such rates would necessarily vary not by five per cent or ten per cent, but by a thousand per cent for the same amount of gas, so transported for the same cost. If the cost of drilling some of the less productive wells had in fact been greater than the cost of drilling those of greater productivity—a not uncommon situation in this industry—the disparity would be even more striking. And if, as would doubtless be the case, the cost of acquiring leaseholds had varied with the time of entrance of these several companies into the field, a further disparity would result from the Commission's singular approach to this problem.

As Mr. Justice Jackson so clearly pointed out just a year ago in his separate opinion in the *Hope case*, any such extraordinary results would be as unwarranted, incongruous and unrealistic as they would be inevitable under the Commission's adopted method. Doubtless others of the Justices then deemed it unnecessary to decide this point, since the Hope company did not in that case raise it as an issue. *However, now that the point is raised and now that*

[1] This extension of the Commission's doctrine in the instant cause is exemplified in its ruling, now on appeal, in *Louisiana Public Service Commission* v. *Interstate Natural Gas Company*, Docket No. G-149, Opinion No. 91, 48 P. U. R. (N.S.) 267.

the issue is contested, it must not only be considered, but is in fact the very "meat" of the case at bar. And when this problem is viewed realistically, it becomes apparent that, however suited a method may be to the making of rates for ordinary utility services, or even for the service of transporting and selling natural gas in pipelines, no method which necessarily produces the strangely varying results just outlined can be deemed to possess either logic or validity in the establishment of appropriate charges in relation to the production of natural gas.

In the *Hope case*, Mr. Justice Jackson succinctly observed that in developing a "rate base" to apply to ordinary public utility operations the aim is "to reason from the known to the unknown." But, as he also observed, when natural gas fields are involved, this method at once becomes "topsy turvy," for:

> "Gas itself is tangible, possessible, and does have a market and a price in the field. The value of the rate base is more elusive than that of gas. It consists of intangibles—leaseholds and freeholds—operated and unoperated—of little use in themselves except as rights to reach and capture gas. Their value lies almost wholly in predictions of discovery, and of price of gas when captured, and bears little relation to cost of tools and supplies and labor to develop it. Gas is what Hope sells and it can be directly priced more reasonably and easily and accurately than the components of a rate base can be valued. Hence the reason for resort to a roundabout way of rate base price fixing does not exist in the case of gas in the field."

Therefore, he concluded,

> "To regulate such an enterprise by indiscriminately transplanting any body of rate doctrine conceived and adapted to the ordinary utility business can serve the 'public interest' as the Natural Gas Act requires, if at all, only by accident."

Although the frank allowance in all instances of the going field price for produced and gathered gas would thus seem

to be the procedure most fitted to do justice to all interests —as well as to reflect most fairly and realistically the economic problem confronting the regulatory body in such a case—it has been reiterated many times in the briefs on file in this cause that if for any reason such fair field price, or value of the gas, as a commodity, in the field under consideration should not be as readily available as it is here, or if —in the case of a transporter who is also a producer—the Commission should for any reason prefer so to do, it could, of course, reach a result quite similar to that of allowing the fair going field price as an expense by including the company's producing and gathering properties in what would be tantamount to a "rate base" at their present market value. We do not deem this a particularly "artistic" mechanism, but it is certainly preferable to the method adopted in this cause. And since the fair field value of the gas is ordinarily so readily discoverable, it seems clear that only in the very unusual instance would such regulatory circumlocution be either justified or appropriate.

The issues and illustrations which have been outlined are in no sense merely academic. For example, from the vast Panhandle Gas Field of Texas numerous great pipeline systems now transport gas to many distant markets. Yet, under the Commission's production "cost" allowance method, as here exemplified, widely differing rates will inevitably be fixed for gas transported through these several systems, since obviously no two will be found with the same lease and production costs. This situation actually exists today, and regardless of an abundance of testimony as to the effective, fair, going rates for gas, as a commodity, in that field, the Federal Power Commission has already used its curious method of production and gathering rate-making in respect to several such lines.[1] Soon it will have moved to establish rates for all the interstate pipelines from

[1] The case of *Panhandle Eastern Pipe Line Company, et al. v. Federal Power Commission, et al.*, No. 296, this term, concurrently on argument with the instant cause, is an excellent example of this procedure.

that field, as well as from the other great gas fields of the nation, and a sound and early resolution of this fundamental issue is therefore imperative.

Such a clearing of the atmosphere seems even more essential because of the tendency, already exemplified, toward an expansion of this "cost of facilities" ratemaking method into other types of factual situations. Exemplifying this trend is the recent proceeding, already noted, and now on appeal in the Circuit Court of Appeals for the Fifth Circuit, in which the Commission went beyond its attempt to fix at "cost" the allowance for gas produced by a pipeline itself (as in the instant cause), and assumed jurisdiction to fix at "cost" the rate to be charged by a "natural-gas company" for gas produced and gathered by it in a large gas field but sold by it in that very field (as a result of arm's-length bargaining) to another, wholly distinct "natural-gas company." *(Louisiana Public Service Commission* v. *Interstate Natural Gas Company, supra.)* This action was taken on the asserted ground that these production and gathering sales were "sales in interstate commerce." And logically, if this trend should continue, the next step must inevitably be for the Commission to assert the power to fix the rates of individual producers, at their divers individual "costs," an almost inconceivably complicated, expensive, time-consuming, and—as we believe—uncalled for task. Yet, under the Commission's premise, these sales might also be deemed to be "sales in interstate commerce."

We have already pointed out that the adoption of the Commission's production-facilities-cost method is wholly unnecessary in any of these situations, from either the commercial, the economic or the public interest viewpoints. Small wonder, however, that the Committee on Natural Gas, Section of Mineral Law, of the American Bar Association remarked, in its 1943 report, that "The mere contemplation of the Federal Power Commission regulation of the well-mouth price of gas which finds its way into interstate commerce makes thousands of individual producers shudder."

And it is to be noted that it was not regulation—as such—which was thus being discussed, but regulation of the type under consideration in the instant cause, for the Committee added:

> "The principles of cost adopted by the Commission in its rate-fixing activities would eliminate forever discovery value, would limit the financial recovery to cost plus 6½ per cent and take away all incentives to wildcat operations. Losses incurred in unsuccessful projects could not be balanced out against the cost of other and different successful projects. Two wells each costing the same but one producing twice as much as the other would result in the price of gas from one well being twice that of the other. It is not too much to say that the economic incentive for the small producer engaged in widely separated projects would be gone."

Acceptance of the "'fair field price" of gas (by whomsoever produced), as the reasonable and logical gas production expense allowance in all instances, will cure every difficulty which has been indicated. Such natural gas is a commodity and is bought and sold on the market, and such fair field price is ordinarily readily ascertainable—witness the unquestioned evidence on this subject in the instant cause. Because of the nature of natural gas and of its production, the principle applies with equal appropriateness both to purchased gas and to gas produced by the transporter itself. Certainly it seems incongruous for one amount to be used in rate-making for purchased gas, and another amount to be used in the same case for self-produced gas from neighboring wells in the same field.

It is as if a motor bus company also owned an oil well from whose production it refines gasoline which it uses (along with gasoline purchased from others) to operate its vehicles. No regulatory body of which we have any cognizance would go through the circumlocution of developing the gasoline expense allowance to be used in fixing such a company's rates by taking the purchase price of the gaso-

line obtained from others and then computing and adding to that sum the "cost"[1] of the company's self-produced gasoline. Rather it would of course use for such allowance

[1] Such "cost" per gallon (under the method which the Commission purported to use in this proceeding) being derived by adding the following:

(a) The operating expenses of running the gasoline refining plant and associated facilities;
(b) The expense incurred in pumping from the oil well that portion of the total pumped oil which is used for gasoline refining purposes;
(c) The taxes on the gasoline plant;
(d) A reasonably allocated portion of the taxes applicable to the oil lease, well and pumping facilities;
(e) The appropriate depreciation accruals on the various component parts of the gasoline plant;
(f) A reasonably allocated portion of the appropriate depreciation accruals applicable to the oil well and pumping facilities;
(g) A reasonably allocated portion of the depletion accruals applicable to the oil lease;
(h) The allowable "return" (i.e., 6½%, or some other selected percentage, of the sum of the following:
  (1) The investment in the gasoline refinery and associated facilities;
  (2) A reasonably allocated portion of the investment in the oil lease (unless lease payments are included as operating expenses);
  (3) A reasonably allocated portion of the investment in the oil well (i.e., its drilling cost), and
  (4) A reasonably allocated portion of the investment in any other jointly used facilities

and by divjding the total by the number of gallons of gasoline produced and used. Of course, it would not be simple to determine the proper allocations to be made in the above calculations, and there might be (and doubtless would be) other items of difficulty and other complications. But we believe the above outline affords a reasonable, even if somewhat rough, picture of the process.

Unless—perchance—part of the gasoline in question were being used in other operations (over which the Commission had no jurisdiction); or were being sold in the open market at its general market price,—in which event other allocations would be requisite and other difficulties would at once arise.

And if there were three or four bus lines, each with its own oil well and gasoline refinery, and each with its separate "costs,"—wouldn't that be a pretty kettle o' fish?

the value (at the current market price) of all of the gasoline in question. To do otherwise would only result in penalizing the bus company (for any efficiency it might show in gasoline production) or its patrons (for the company's inefficiency)—neither result being appropriate to the situation.

It is equally incongruous for numerous different (similarly derived) rates to be made applicable to similar amounts of gas produced from the same underground reservoir at the same time by different companies, as it is for one amount to be used in rate-making for purchased gas and another amount to be used in the same case for self-produced gas. Yet the Commission's adopted method necessarily results in these incongruities.

In their brief, respondents assert the difficulty of ascertaining the fair field price of gas, but the accumulation of testimony on this subject in numerous cases before the Commission belies this apprehension. Certainly the Commission is in no instance left helpless. Ordinarily, the price for gas set forth in purchase contracts in the field may fairly be used (as the Commission actually has done up to the present time in most instances of independently produced gas). If the Commission should entertain any doubt, it could call for proof, and in the case of gas purchased from an "affiliate" it might be justified in holding the burden to be on the purchasing company to prove the contract price a fair, going field price. Where the gas is self-produced the burden of proving such fair, going field price (or value) would doubtless be on the producer. Only where adequate testimony cannot be had would the Commission be forced to any sort of computation, let alone the particular one it selected in the instant cause. We venture to say that in few, if any, cases (where large pipelines are involved) would any difficulty of consequence arise in the development of a proper allowance equivalent to a fair, going field price, or value, of the gas.

Therefore, because of the nature of this commodity and of its production, as well as the dangers, the difficulties and the confusion to be apprehended from any other course of action, we urge that the regulatory forces and the courts should firmly eschew any temptation to assimilate this particular item into usual utility service regulatory categories, and that they should recognize that this is not an ordinary "rate base" problem, but rather involves "an entirely different sort of critter."

CONCLUSION.

If the Federal Power Commission's gas production "cost" method of rate-making should now be judicially approved, the road ahead for the nation's gas pipeline companies cannot be other than a one-way street. For, if such a concern's gas production costs (for leases and drilling) are low for any reason, and if it can therefore produce gas for a total cost per cubic foot less than the recognized and going field price for such gas in the field, it will patently be penalized for its foresight or efficiency; whereas, if its costs per cubic foot of produced gas are for any reason greater than such fair, going field price, neither this Commission nor any other conscientious regulatory body would (or could for long) allow it such higher costs as reasonable expenses in fixing rates for the sale of gas at the conclusion of its transportation operations, if it could purchase the same amount of gas at lesser cost in the field. Obviously, though the fair market value of such a commodity so transported and sold may from all viewpoints be deemed fairly to measure the propriety of the expense allowance, the Commission's adopted method, as here exemplified, must inevitably mean "Heads we win; tails you lose." It could not be otherwise.

We respectfully submit that the Federal Power Commission does not possess jurisdiction to fix petitioner's rates for production and gathering, and that its action in the instant cause was therefore unauthorized, since it clearly

constituted an attempt to fix such rates. On the other hand, if the Federal Power Commission should be deemed for any reason vested with jurisdiction to establish these production and gathering charges, we submit that the machinery which it here adopted was wholly unsuited to the problem before it. Under either aspect of the situation, the Commission's action—and that of the Circuit Court in approving it—should be reversed.

Respectfully submitted,

v.

FEDERAL POWER COMMISSION, CITY AND COUNTY OF DENVER, COLORADO, PUBLIC SERVICE COMMISSION OF WYOMING, COLORADO-WYOMING GAS COMPANY, PUBLIC SERVICE COMPANY OF COLORADO, AND COLORADO INTERSTATE GAS COMPANY, *Respondents.*

BRIEF OF THE INDEPENDENT NATURAL GAS ASSOCIATION OF AMERICA, AMICUS CURIAE, IN SUPPORT OF THE PETITION OF CANADIAN RIVER GAS COMPANY FOR REHEARING AND FOR ENLARGEMENT OF SCOPE OF REVIEW.

This brief of the Independent Natural Gas Association of America is presented *amicus curiae*, under Rule 27, Paragraph 9, of the Rules of this Court.

On December 4, 1944 Petitioner herein, Canadian River Gas Company, filed with the Court a petition for rehear-

ing and for enlargement of the scope of review permitted by the order of this Court of November 13, 1944.

In its said petition for rehearing, Petitioner requests this Court to include within the scope of its review; among other issues, the question whether the Circuit Court was correct in its ruling in respect to the exercise of jurisdiction by the Federal Power Commission over facilities used for the production and gathering of natural gas (Question No. 1, Pages 2-12, Petition for Rehearing).

The Independent Natural Gas Association of America is a corporation organized and existing under the laws of the State of Delaware. Its membership includes royalty owners and those engaged in the production, gathering or transmission of natural gas. One of the principal purposes of the Association, as set forth in its charter, is to assist in the protection of the interests of the natural gas industry.

The Association and its constituent members are vitally interested in any question involving the lawfulness of assertion by the Federal Power Commission of jurisdiction over the production or gathering of natural gas. Section 1(b) of the Natural Gas Act (52 Stat. 821, Title 15 U. S. C. 717) specifically exempts from the Commission's jurisdiction "the production or gathering of natural gas." The Association believes that the question raised by the Petitioner herein in respect to the validity of the jurisdiction asserted and exercised by the Federal Power Commission over facilities used for the production and gathering of natural gas in the instant proceeding is an important issue of Federal law. The appropriate resolution of this issue is a matter of large significance to the natural gas industry of the country. We believe it of the highest importance, in the public interest and in the interest of this important industry, that this issue should be specifically passed upon by this Honorable Court in its review of the instant cause. Many of the reasons for this position on the part of this Association are set forth in Petitioner's petition for rehearing and enlargement, above mentioned, and seem not to require restatement here.

The Independent Natural Gas Association of America therefore respectfully suggests and requests that this Court enlarge the scope of review permitted by its order of November 13, 1944 to include the question whether the Federal Power Commission has properly exercised jurisdiction over the production and gathering facilities of the Canadian River Gas Company which are involved in this proceeding.

Respectfully submitted,

INDEPENDENT NATURAL GAS ASSOCIATION OF AMERICA,

v.

FEDERAL POWER COMMISSION, CITY AND COUNTY OF DENVER, COLORADO, PUBLIC SERVICE COMMISSION OF WYOMING, COLORADO-WYOMING GAS COMPANY, PUBLIC SERVICE COMPANY OF COLORADO, AND COLORADO INTERSTATE GAS COMPANY, *Respondents.*

PETITION OF THE INDEPENDENT NATURAL GAS ASSOCIATION OF AMERICA, AMICUS CURIAE, FOR A REHEARING.

The decision of April 2, 1945, in this proceeding has served only to render more perplexing an already confused and somewhat bewildering situation. Four only of the nine Justices of this Court would unqualifiedly sustain the Federal Power Commission in its assumption in this case of rate-making authority over the "production and gathering" of natural gas; four of the remaining five Justices would

reverse that action as clearly beyond the Commission's statutory jurisdiction, while one—the Justice whose conclusion thus became controlling—has declared, in effect, "I would like to reverse the Commission's action, *but* . . . "

It is to this formidable and here decisive little "but" that we must therefore address ourselves. What is the nature and fundament of this curious judicial paradox? What has actuated this singular resolution of the essential issue of this cause?

The Independent Natural Gas Association of America did not seek to appear as *Amicus Curiae* in this proceeding because of any special or financial interest in this particular cause or in this particular Petitioner. It appeared because of its members' conviction that a sound resolution of the issue of Federal Power Commission authority over "production and gathering" under the Natural Gas Act is a matter of paramount import to the entire natural gas industry, and particularly to the multitude of independent producers and royalty owners of the country who form the backbone of this widespread industry. The value of their wells and gas reserves is directly affected by the ruling which has here been made. Indeed, their interests, wherever they may be, are as directly affected by this decision as are those of this pipeline company. If it be the law that the value of half the gas produced from a given gas well is to be determined by costs incurred many years ago (or perchance by no cost at all) under exploratory conditions wholly at variance with those now prevailing, it is obvious that the value of the other half is at once affected, as is also the value of the royalty owner's interest. A general adoption of the cost method of valuing gas-producing properties—as here exemplified—cannot fail, therefore, to affect the value of all reserve and gas well properties. This effect is as immediate as it is certain. That is why we are here, and it is the only reason we are here. That, also,—as we believe—was the real reason why Congress at least at-

tempted to withhold the sphere of "production and gathering" from the Commission's jurisdiction.

Under these circumstances, this Petition for Rehearing is necessarily aimed with the utmost frankness at Mr. Justice Jackson's opinion and reasoning. If the situation which the learned Justice deemed controlling, contrary to his expressed desired to reverse the Commission in this case, should in some appropriate manner be disclosed not to be thus logically or properly determinative in this particular proceeding and against this particular company, then, we believe, a majority of the Justices of this Court would at least be in agreement in favor of an "end result" of reversal by this Tribunal, whether or no they might wholly agree upon the appropriate legal basis for such action. We file this Petition, therefore, not for any purpose of delay, but because we are convinced, in all good faith, that we can fairly show that Mr. Justice Jackson's concurring opinion resulted from a misapprehension of certain factors basic to this case.

We shall here advert to but two of these factors. Both are involved in Mr. Justice Jackson's reasoning under the *Hope* decision.[1] As we read his concurring opinion, the basic concept underlying his reasoning in his belief that, for judicial purposes, it is essential that the philosophy expressed in the *Hope* case shall prevail until—as we understand him—the supporters of that philosophy finally hang themselves upon the horns of an as-yet-unforeseen but inevitable dilemma. Frankly, we can read no other premise into the learned Justice's observation that he possesses "no intuitive knowledge as to whether a given price is reasonable"; his assertion that he cannot with sincerity recede from his reasoned expression in the *Hope* case, and his firm belief that the Court's decision in that proceeding provides "no workable basis for judicial review, no key by which

[1] Federal Power Commission v. Hope Natural Gas Co., 320 U. S. 591.

commissions can anticipate what rule, if any, will control our review, and no guidance to counsel as to what issues they should try or how they should try them," and—finally—his statement that "the majority which promulgated that decision, or a majority of that majority, should be permitted to continue to spell out its application to specific problems until we can see where it leads."

If, as Mr. Justice Jackson also asserts, the philosophy underlying the *Hope* case is, in fact, "fantastic," then assuredly there lurks behind his reasoning the conviction that further application of that philosophy to specific problems cannot fail to lead to fantastic results. It is the belief of your *Amicus Curiae* that such a consequence has already come to pass in this very proceeding, and that the learned Justice may, on the best of rational grounds, adopt that view in the light of:

(1) His misapprehension in respect of the rates actually here involved, and

(2) His (as we believe) misconception of the "immediacy" of impact of the Commission's action upon "production and gathering" activities.

I.

THE RATES HERE INVOLVED PRESENT NO DISPARITIES OF THE NATURE OUTLINED IN THE CONCURRING OPINION.

Mr. Justice Jackson is deeply and sincerely concerned with the proper conservation and use of natural gas as a national resource. He has noted an apparent disparity in the prices charged by the Colorado Interstate Gas Company, appellant in another and separate proceeding, for gas sold by that company to the Colorado Fuel and Iron Company for industrial purposes, on the one hand, and for gas sold by Colorado Interstate to the distributing company serving the city of Denver, on the other. We are advised that the prices mentioned by the learned Justice in respect

of such rates are not in fact correctly stated, and we are further advised that the actual disparity is much less than he has suggested. Be that as it may, the fact is that by the use of such criteria Mr. Justice Jackson has fallen into what we respectfully believe to be the error of resting his conclusion under this phase of his reasoning upon rates applicable wholly to a totally different entity from that which is the subject of this proceeding, the Canadian River Gas Company.

Colorado Interstate is not Canadian; it is a customer of Canadian, and has so been held by the Federal Power Commission, which has fixed the rates of Canadian for all sales of gas to Colorado Interstate, without distinction as to eventual use or eventual purchaser, and which has been held justified in so doing by this Court. There is not now, nor has there ever been, any disparity between the price charged by Canadian to Colorado Interstate for gas to be sold by the latter for various purposes or to various customers or types of customers. The disparity of rates which has impressed Mr. Justice Jackson (even were it of the magnitude which he supposed) has therefore no application to Canadian, whose rates were separately fixed by the Commission upon the basis of facts not pertinent to Colorado Interstate. Certainly, it should not require argument to convince the learned Justice that, in such a situation, he has fallen into a not unnatural but nonetheless determinative factual pitfall. It is like condemning a farmer because a portion of the pork products sold by him at a uniform price to a butcher were found to have been resold by the latter in the black market.

The fact is that Mr. Justice Jackson has rested his view that the "end result" of the rate order fixing Canadian's rates may be supported under the *Hope* case philosophy upon certain assumed facts which simply do not apply to the company whose rates are here at issue. Those other rates were at issue in a totally separate and distinct pro-

ceeding. They were necessarily the subject of a separate order of the administrative tribunal. The appeal of that other company from that order constitutes a totally different and necessarily distinct appellate proceeding before this Court, which was briefed and argued separately and was only joined for decision with the case of Canadian River Gas Company for purposes of convenience. These separate appeals raised wholly separate and distinct issues for determination by this Court. That other company has no production or gathering properties, and its rates simply are not at issue in this proceeding. Yet, on the basis of that other company's charges to various consumers for regulated and unregulated gas, respectively, and not otherwise—as we understand him,—has Mr. Justice Jackson rested his determinative opinion that the *Hope* case philosophy may here be applied.

We believe that a rehearing of this cause will show this to be true. And if it be true, may not an alteration in the learned Justice's decisive opinion reasonably and fairly be expected?

II.

THE IMMEDIACY OF IMPACT OF THE COMMISSION'S ACTION IN RESPECT TO PRODUCTION AND GATHERING.

The confusion of Colorado Interstate, and its rates, with Canadian, and its rates, is the more unfortunate—in the light of the curious 4-4-1 decision which has here eventuated—because it has apparently led to another quite disconcerting conclusion on the part of the concurring Justice, a conclusion which seems wholly at variance with the reality of what the Commission here did. Indeed, the very nub of this entire proceeding, as it turns out, is the declaration by Mr. Justice Jackson to the effect that the order here under consideration has no "immediate" impact upon the production or gathering of gas by the Petitioner. The implication is plain that, had the learned Justice been of

the opinion that the order did have such "immediate" impact upon production and gathering, his resolution of the issue of jurisdiction would have been different. Let us therefore briefly examine the nature and essence of that impact.

In the first place, if a man owns a house and some official tells him he may not paint it, the impact as to paint may be immediate, but he still owns the house and may sell it, if he so desires, at whatever price he can obtain. On the other hand, if, after receiving an offer of $10,000 dollars for the property, the same houseowner were to be told by some authority that he could only receive $5,000 dollars from the sale, the impact might not be "immediate," in a certain sense, but its result would doubtless be far more drastic. And if the poor fellow needed to obtain cash for any reason—perhaps to paint another house—we more than suspect that the impact of the latter ruling would be much more actual—and indeed more truly "immediate"—than would that of the former.

This is the very situation here confronted. Natural gas reserves are not bought or sold or held merely for fun. They have no value save as they may be used, through present production and sale of gas from wells drilled into them, or by reason of potential sales which will return more than the cost of holding the gas for a time in the ground. The operations of production and gathering of gas are for one purpose, and one purpose only,—to market the gas so produced. If it could not so be marketed there would be no such operations. And if the price at which it can be marketed by one producer is held to an amount less than another producer may freely charge, the production operations of the first producer are as "immediately" affected as if some of his wells were destroyed. Only for the purpose of proper conservation, and then only on an impartial basis applicable to all, would any such result be consistent with justice and reason. And in such a case the methods

used would necessarily differ in kind from those adopted here.

The Commission did not here act for conservation reasons. It did not even purport to do so, and it is doubtful whether it could have acted for such reasons in any event, since this function has been reserved to the states. But the result is that this producer, this petitioning corporation, is so immediately affected that its production and gathering operations are not merely hampered or rendered less profitable,—they are jeopardized in their entirety. And the interests of the gas consumers for whose benefit this company's gas reserves have been collected are likewise vitally and immediately affected.

In this connection, it is fundamental to remember that one of the most essential functions of a large natural gas pipeline project consists in the "blocking out," by contract, purchase or otherwise, of sufficient reserves of gas in the ground to assure the successful maintenance of the enterprise over a considerable period of years. The consuming public at the discharge end of a long transmission pipeline would hardly be protected or satisfied if the enterprise possessed only the mere hope of being able, from year to year, on some annual catch-as-catch-can basis, to continue to secure its necessary supplies of gas in the field. It is therefore sound economics for such a system to provide itself with adequate reserves of gas, not merely to make certain that the cost of its project may be returned out of earnings over the years (a *sine qua non* for the attraction of investors, and thus for the sound financing of the project), but also to insure to its patrons an adequate and continuing supply of gas. The importance of this element of natural gas pipeline operations cannot be too greatly emphasized.

The effect of the decision in the instant cause, however, cannot prove other than a deterrent to any such procedure. Already it is being said in the industry that it would be far better for producers to sell their gas in the field for unre-

gulated uses only (thereby jeopardizing the future reserves of all natural gas pipelines) than to risk being forever held to "aboriginal cost" as the basis for the pricing of gas entering an interstate pipeline.

It is, of course, the interplay of economic forces, rather than the operation of any regulatory processes—as such, which draws gas from the earth into the stream of commerce. A regulatory process wholly at variance with the economics of the problem may, however, produce seriously deleterious effects. As Mr. Justice Jackson has remarked, a price of gas in the field sufficient to draw it into the stream of commerce, but no greater price, is what is economically required. And, as the learned Justice has likewise pointed out, the "aboriginal cost" method of pricing such gas produces a result bearing no relation, logical or otherwise, to such an economic price. The forces which underly this situation rest in delicate balance, and obviously, should any large proportion of the owners of gas reserves (or of gas produced in association with oil) find it uneconomic—as they doubtless will—to allow their gas to enter interstate pipelines for regulated uses on the aboriginal cost pricing basis, the gas in question will inevitably be diverted to other ends. Here, again, is seen the true "immediacy" of impact of this decision upon the production and gathering of natural gas.

The force of this impact, and the vital relation between price and conservation, are well illustrated in certain recent statements and reports, from which we deem it appropriate to quote. For example, Commissioner Ernest O. Thompson, of the Texas Railroad Commission, aptly described the situation when he recently remarked (see *The Oil Weekly*, March 12, 1945, p. 27):

> "We have an abundant supply of gas in Texas. We are marketers of gas. . . . It is my view that as we have more competition in the purchase and sales of gas we shall get a better price for it. . . . When we get a better price we can have better waste prevention; as, the

owners will have something worth conserving and they will not allow it to be blown into the air."

In similar vein, Commissioner Beauford H. Jester, of the same Commission, is quoted in *The Oil Weekly* for December 11, 1944, as declaring that "too much gas has been wasted in the past because it had no market and consequently no sale value."

In the leading editorial in the January 1945 issue of *Gas*, Mr. Elliott Taylor spoke of the work being done by the Regulatory Practices Committee of the Interstate Oil Compact Commission (which represents states producing some 80 per cent of the total of natural gas now being marketed). Of that Commission, Mr. Taylor says:

> "Perhaps better than any single regulatory body the Commission recognizes the delicate balance that exists between the economics of natural gas disposition and that of petroleum production. It recognizes the fact, sometimes obscured to the Federal Power Commission, that pure social theories cannot be relied upon to bring oil to the surface and leave the gas behind. And it recognizes that what happens to the natural gas that comes to the surface in association with petroleum production depends almost entirely on what that gas is worth. If it commands no better price than 1½c to 2c at the wellhead it is not worth conserving and no legislative interference with the ultimate dispositon of the gas will ever change that simple economic fact. The studies of the oil compact commission's special committee have convinced its members that 'better prices seem obtainable only through an expanding competitive market.'"

We cannot fairly leave this subject of the influence of price on sound conservation practices without quoting briefly from the report of the committee of which Mr. Taylor was speaking. In December 1944 that committee stated (*Quarterly Bulletin*, Vol. I, No. 4):

> "There has been considerable discussion concerning the importance of the price paid for gas as affecting its

conservation. It is a matter of common knowledge that low prices and that existing disparity of prices have created great confusion in the natural gas industry.

"Your Committee on Regulatory Practices is of the opinion that these elements have rendered extremely difficult the duty of the enforcement of conservation statutes; and that any successful program of conservation and utilization must, in the last analysis, frankly face this issue and take it into consideration."

In an earlier report (published in the *Quarterly Bulletin* of the Oil Compact Commission, Vol. III, No. 2, July 1944), this same committee remarked that, as early as December 1942, it had pointed out "the relationship which the price of natural gas had to the problem of conservation," and it added that many projects for the expanding uses of natural gas, chemical and otherwise, in the interests of its sound utilization, "could not, and would not, be constructed if the product at the wellhead was not commanding a price commensurate with its intrinsic worth."

We have adverted to these reports and statements solely because of their important, and wholly independent, bearing on the issue here under consideration. If the fair market price of gas at the wellhead is not to be allowed to govern, but if—instead—some lower, "aboriginal cost" method of pricing such gas is to be adopted (with widely varying price levels as between different producers in the same field, and, indeed, between producers from the same well), the impact of that method (which is wholly oblivious to existing economic balances) cannot fail to be both "immediate" and certain in every gas-producing area. It is as immediate and certain upon the industry as a whole as it is with reference to this single gas producer's operations.

One further word on the "immediacy" of impact upon this single company. Even were we to accept the premise that the statutory exception of "production and gathering" applies only to the "activity" of producing and gathering gas, the impact of this order is direct and immediate upon

that activity. For example, the Commission has essayed to fix the amount of working capital which this company may be allowed for the conduct of its production and gathering operations. It has authorized no earnings at all for gas produced from some wells, and only a bare pittance for gas from others. It has purported to establish the precise amounts which will be allowed the company to cover the cost of future producing and gathering operations. It has altered the amounts already fixed by contract for the carrying on by this company of producing and gathering "activities." And the company is obviously placed in a position in which, because of this treatment of its production and gathering "activities" (which constitute some two thirds of its business), it cannot meet its actual costs incurred in those activities. If to force a corporation into probable bankruptcy, under such circumstances, or if to fix and limit by administrative mandate the precise amounts which this enterprise will be allowed to recoup as operating expenses for and in respect of such production and gathering activities, is not to exert "immediate impact" upon the activities which constitute so great a proportion of its business, then we are at a loss to understand the English language.

So far as the "impact" upon an owner of a gas lease is concerned, the result of an order that he may not charge anything for gas from a well he has already drilled is just as "immediate" as it would be if the order were that he would not be allowed to drill a well at all. His production "activities" are equally affected and circumscribed. And the "impact" of an order allowing him to charge rates covering only the operating expenses of one well halts him as "immediately" from drilling another as would a direct order not to drill the second well. To say that the "activity" of gas production is not as immediately affected by the one order as it is by the other seems only to beg the question posed here by the Congressional prohibition

against the application of this statute to production and gathering.

It affords us small consolation to recall that the Chief Justice, and his associates in this case, clearly recognized the immediacy of such impact, and also recognized the fact that, by reason of the treatment accorded these production and gathering properties by the Commission, the most direct possible form of regulation has been imposed upon such properties, despite the language of Section 1(b) of the statute. We say that this affords us small consolation because we are confronted with an assertion by the Justice who concurred in result only with another four Justices merely declaring—without more—that the impact is somehow not "immediate." We believe we have illustrated how truly immediate the impact is, and should this petition for rehearing be granted, we feel certain that we can disclose to the concurring Justice that his assertion in this regard resulted from a misapprehension of certain of the basic factors here involved.

III.

THE HOPE DECISION AND THE INSTANT CAUSE.

We are constrained to add a few words anent the *Hope* decision and its applicability to the situation here confronted. We have read and reread that decision, and, though the matter is not there made entirely clear, we fail to find in that case any suggestion that an administrative body is henceforth to be relieved of the duty to consider and act in such a matter on *some* reasonable basis. All that we discern for certain is that the administrative process is not held to any particular set course. But the course adopted must, we believe, bear some logical relation to the end which is being sought. The majority in the *Hope* case found that relation in certain record data on corporate financial background and the maintenance of financial integrity. At no point do we find support for the thought

that ratemaking is by that decision afforded the freedom of mere intuitive processes.

Certainly, neither Mr. Justice Jackson, nor (we believe) the Justices for whom Mr. Justice Douglas spoke in the instant case, would find support in the *Hope* case philosophy to sustain a rate ruling of an administrative body whose end result (i. e., the rates finally established) rested solely and wholly upon a mere count of the baldheaded men in the hearing room, without more in the record. Nor would they, or any of them, apparently sustain such an order were it based wholly upon a record and finding that on the day of hearing it was raining. Such extraneous criteria could hardly support any reasonable conclusion on the technical subject of rates, and as we read the *Hope* decision there must be some logical criterion of judgment on which the "result" of the rate-making process may be measured, even though the "mechanics" has not been frozen to any particular course.

As we understand them, Mr. Justice Douglas and his associates looked in the *Hope* case for such a criterion in the financial and credit maintenance necessities of the corporation there involved. Had it been clear in that case that, though soundly financed and efficiently managed, and though possessed of a well-balanced capital structure and a sound market, that corporation could not maintain a reasonable position of financial integrity upon the rates as fixed, the decision—as we discern its reasoning—would have been different. In other words, for the "fair value times fair rate of return" criterion, these Justices there substituted a highly positive standard, which, as to rates otherwise reasonable under value of service criteria, they felt could fairly be used as a guide.[2] The matter was therefore

[2] See "The Hope Case and the Direct Approach to 'Fair Return,'" by Carl I. Wheat, *Public Utilities Fortnightly*, April 27 and May 11, 1944 (Vol. XXXIII, Nos. 9 and 10, pp. 531 and 617). Also, "the Direct Approach to the Fair Return Ques-

not merely one of "intuition," nor could the decision to support the Commission in that case be truly termed a mere drawing of a paper out of a hat.

In the instant proceeding, however, we seek in vain for data on which to apply any such yardstick as was thus established in the *Hope* case for the reasonable measurement of the "end result" reached through the administrative process. *The only data suggested by Mr. Justice Jackson applies solely to another company in a different proceeding and has no applicability of any sort to this company or to this case.* In the absence of such data, the only support for the sole criterion even hinted at in the *Hope* case is here lacking, and even a Justice who supported that ruling (not to mention one who dissented) could, as we see it, fairly, soundly and logically rule here to reverse the administrative action. Otherwise, we would be left merely with a process of counting bald heads, and surely that cannot be the sort of means which could justify an end in rate-making, even under the broadest interpretation of the *Hope* case. Even under that decision, the end must be justifiable under facts applicable to the concern whose rates are at issue. And even under that decision, the "end result" must find support in reason, regardless of the frailties of any particular method that may have been used to reach it.

We therefore respectfully suggest that Mr. Justice Jackson concluded to allow the *Hope* case philosophy to prevail in this cause as a result of a misunderstanding of the admittedly complex record in this proceeding. We further respectfully suggest that, as a direct and immediate result of that misconception (and the erroneous consideration of

---

tion," by Paul B. Coffman, *Public Utilities Fortnightly*, August 27 and Sept. 10, 1942 (Vol. XXX, Nos. 5 and 6, pp. 277 and 350), and "The Problem of the 'Rate of Return' in Public Utility Regulation," June 15, 1938, a report of the Telephone Rate and Research Department (Telephone Investigation) of the Federal Communications Commission.

another company's rates and operations as applying to this company's situation), the learned Justice has rested his concurring opinion upon a semblance of actuality which simply does not in fact exist in this case. A rehearing and reconsideration of this matter will, we verily believe, disclose this to be the situation.

CONCLUSION.

One final aspect of this situation should be noted. We have already adverted to the sincere interest of Mr. Justice Jackson in the sound conservation of natural gas resources. With this conviction we find ourselves in hearty agreement. We have also adverted to the fact that the price at which gas produced in any given field may be sold is a vital factor—indeed, the critical factor—in inducing the sound conservation of such a resource. That this factor looms especially large in the case of natural gas is amply demonstrated by the history of this very gas field, the so-called Panhandle Field of Texas. It was during the early years following the discovery of that field, but before the advent of the pipelines which now carry much of its gas to distant markets, that waste of the grossest type existed. The prime reason for such waste was the utter lack of any economic market. Only when a market was developed through the construction of pipelines, and only when the value of the gas in the field was thus raised to more economic levels, was this waste curtailed.[3]

May we respectfully yet earnestly suggest that the decision in the instant cause cannot fail to produce effects

[3] Description of the chaotic conditions and waste of gas which prevailed during the earlier years of the Panhandle Field, prior to the advent of large pipelines and the consequent provision of a distant market for gas, which would otherwise have been wasted, are to be found in *Thompson* v. *Consolidated Gas Utilities Corp.*, 300 U. S. 55, 81 L. Ed. 510, and *Final Report of the Federal Trade Commission* on economic conclusions respecting natural gas (Senate Document 92, Part 84-A, 70th Congress, 1st Session).

upon conservation in this and other gas fields of the most harmful character, through limitation of values—and therefore of the price incentives which produce truly economic conservation practices. If it be allowed to stand, the ruling of the Federal Power Commission in respect to this Petitioner cannot fail, in our opinion, to encourage inefficient uses of gas in or near gas fields; to inhibit many types of uses as to which natural gas is the technically preferred fuel, and generally to restrict development and ultimate production in the Panhandle Gas Field, with resultant social and economic loss to the nation as a whole.

WHEREFORE, The Independent Natural Gas Association of America respectfully requests that a rehearing be granted in this matter, that reconsideration of these pertinent issues be undertaken, and that the mandate of the Court be stayed until such time as the proceeding may have been concluded.

Respectfully submitted,

IN THE

SUPREME COURT OF THE UNITED STATES

October Term, 1944.

No. 380.

CANADIAN RIVER GAS COMPANY, a Corporation,
PETITIONER,

v.

FEDERAL POWER COMMISSION, CITY AND COUNTY OF DENVER, COLORADO, PUBLIC SERVICE COMMISSION OF WYOMING, COLORADO-WYOMING GAS COMPANY, PUBLIC SERVICE COMPANY OF COLORADO, and COLORADO INTERSTATE GAS COMPANY, RESPONDENTS.

PETITION OF CANADIAN RIVER GAS COMPANY FOR REHEARING AND FOR ENLARGEMENT OF SCOPE OF REVIEW.

Canadian River Gas Company, petitioner, heretofore filed its Petition for Writ of Certiorari herein presenting nine separate questions. By its Order of November 13, 1944, this Court granted said petition, limited to the Eighth Question presented thereby, which Eighth Question is as follows:

"8. Whether the Commission can, consistently with the Fifth Amendment to the Constitution of the United States and the provisions of the Act, reduce the rates and charges of Canadian on that part of its natural gas sales to Colorado Interstate which is not sold by the latter for ultimate distribution to the public but is sold by it directly to its industrial customers; furthermore, independent of

the above question, whether the Commission erred in making no separation or allocation as between Canadian's properties devoted to intrastate sales in Texas and its properties devoted to interstate sales, or as between the properties of Canadian and the properties of Colorado Interstate, and in using in lieu thereof a substitute method of allocation of cost of service which results in burdening non-regulable gas with costs actually chargeable against regulable gas, in violation of the Fifth Amendment to the Constitution of the United States and the Act."

Petitioner now respectfully petitions this Court to grant a rehearing herein to the extent that its Order of November 13, 1944, denies review by this Court of Questions 1, 2 and 3 set forth in its Petition for Writ of Certiorari, and to enlarge the scope of the review to be had in this Court so as to include the Questions Nos. 1, 2 and 3, as well as the Question No. 8 set forth in said Petition for Writ of Certiorari.

In support of this petition, petitioner respectfully shows:

QUESTION NO. 1.

Question No. 1 set forth in the Petition for Writ of Certiorari is as follows:

"1. Whether the Circuit Court, after correctly holding that the Commission has no rate regulatory jurisdiction over Canadian's production and gathering properties, facilities and business, erroneously concluded and ruled that the Commission in this case did not exercise such prohibited jurisdiction."

Petitioner believes and submits that in failing to include this question within the scope of its granted review the Honorable Court has overlooked or misapprehended the public importance and real significance of the question presented, all of which is evidenced by the following brief summary statement of facts:

(a) Section 1(a) of the Natural Gas Act declares the Congressional intent and sets forth the purposes of the Act "that the business of *transporting and selling* natural gas for ultimate distribution to the public is affected with a pub-

lic interest, and that Federal regulation in matters relating to the *transportation* of natural gas and the *sale* thereof in interstate and foreign commerce is necessary in the public interest."

(b) Not only does the Act by Section 1(a) limit its scope and coverage to interstate transportation and sale of natural gas, but to foreclose all possibility of misconstruction or an unwarranted assumption of non-granted jurisdiction Section 1(b) of the Act expressly provides that it "shall not apply to * * * the production or gathering of natural gas." Clearly the English language contains no words which could more positively express the Congressional intent than are found in these two subdivisions of the very first section of the Act.

(c) If aid to interpretation of the clear, positive and unambiguous language contained in Sections 1(a) and 1(b) of the Act is for any reason thought necessary or desired, it can be abundantly found in the legislative history of the Act where its sponsors, including the representatives of the Federal Power Commission, stated time and time again that the Act was not designed to and did not cover production and gathering. See statements of Mr. Dozier A. DeVane and Mr. Thomas A. Tingley, Solicitor and Assistant Solicitor, respectively, of the Federal Power Commission contained in the official report of "Hearing Before a Sub-Committee of the Committee on Interstate and Foreign Commerce, House of Representatives" in connection with the original H.R. 11662, pages 17, 28, 34, 35, 42, 43; statements of Chairman Lea, Congressional Record, Volume 81, Part 6, page 6721; and Senator Wheeler, Congressional Record, Volume 81, No. 162, page 11981.

(d) This Court, in *Federal Power Commission v. Natural Gas Pipeline Co.*, 315 U. S. 575, and *Federal Power Commission v. Hope Natural Gas Co.*, 320 U. S. 591, has approved actions of the Commission only because the Commission was found to have acted within the "ambit of its authority," and in the Hope Case (p. 287, Vol. 88 L. Ed., Advance Opinions) this Court stated:

"As we have said, the Act does not intrude on the domain traditionally reserved for control by state commissions;

and the Federal Power Commission was given no authority over 'the production or gathering of natural gas.'"

(e) The Circuit Court of Appeals for the Tenth Circuit in its opinion in this case (142 Fed. (2d), p. 952), following the mandate of the Act and the ruling of this Court, correctly stated that "under Section 1(b) the Commission does not have express or implied rate regulatory jurisdiction of the production and gathering of gas," and that under Section 1 of the Act the production and gathering properties and facilities of petitioner, while part of its integrated operations, "lie beyond the range of the rate-regulatory jurisdiction of the Commission."

(f) In view of the express and positive provisions of the Act, the legislative history thereof, the ruling of this Court in the Hope Case quoted above, and the quoted language from the Circuit Court's opinion, we are absolutely unable by recourse either to reasoning or imagination, to justify the lower court's ruling that what the Commission did in this case does not constitute a usurpation of rate regulatory jurisdiction over production and gathering so universally recognized as being expressly withheld from the Commission. The Commission itself makes no contention that it has not exercised rate regulatory jurisdiction over Canadian's production and gathering, but attempts to justify its action on the theory that an exercise of such jurisdiction is essential, although not granted by Congress, to a proper exercise of its delegated rate regulatory jurisdiction over interstate transportation and sale of natural gas. That this contention is without merit and that the Commission did in this case exercise prohibited rate regulatory jurisdiction over production and gathering are demonstrated by the following:

(g) Mining operations, which would include production of natural gas, have been uniformly held by this Court to be local in nature and not to constitute interstate commerce, even though the product mined is destined to be shipped in interstate commerce.

Corporation Commission of Oklahoma v. Champlin Refining Co., 286 U. S. 210, 76 L. Ed. 1063.

Thompson v. Consolidated Gas Utilities Corp., 300 U. S. 55, 81 L. Ed. 510.

Heisler v. Thomas Colliery Co., 260 U. S. 245, 67 L. Ed. 237.

Oliver Iron Mining Co. v. Lord, 262 U. S. 172, 67 L. Ed. 929.

Carter v. Carter Coal Co., 298 U. S. 238, 80 L. Ed. 1160.

Hope Natural Gas Co. v. Hall, State Tax Commissioner of West Virginia, 274 U. S. 284, 71 L. Ed. 1049.

Jersey Central Power & L. Co. v. Federal Power Commission, 319 U. S. 61, 87 L. Ed. 1258.

(h) The fact that the production and gathering may affect interstate commerce does not vest rate regulatory jurisdiction in the Commission over production and gathering as the Natural Gas Act is different from other acts adopted in recent years which vested jurisdiction in commissions where the subject-matter of the act, "affected" or "burdened" or "obstructed" interstate commerce:

National Labor Relations Board v. Jones & Laughlin Steel Corp., 301 U. S. 1, 81 L. Ed. 893. (National Labor Relations Act)

Sunshine Anthracite Coal Co. v. Adkins, 310 U. S. 381, 84 L. Ed. 1263. (Bituminous Coal Conservation Act)

United States v. F. W. Darby Lumber Co., 312 U. S. 100, 85 L. Ed. 609. (Fair Labor Standards Act)

Federal Trade Commission v. Raladam Bros., Inc., 312 U. S. 349; 85 L. Ed. 881. (Federal Trade Commission Act)

California Rice Industry v. Federal Trade Commission, (C.C.A. 9, 102 Fed. (2d) 716.) (Federal Trade Commission Act)

A. B. Kirschbaum v. Walling, 316 U. S. 517, 86 L. Ed. 1638, 1646. (Fair Labor Standards Act)

Walling v. Jacksonville Paper Co., 317 U. S. 564, 87 L. Ed. 460. (Fair Labor Standards Act)

Public Utilities Commission of Ohio v. United Fuel Gas Co., 317 U. S. 456, 87 L. Ed. 1162. (Federal Power Commission)

While Congress may have the power to regulate matters *affecting interstate commerce* as well as matters *in interstate commerce*, all the above cases make it absolutely clear that Congress does not have to exercise its full power, and that where it only delegates jurisdiction over matters *in interstate commerce*, such jurisdiction cannot be extended so as to include matters which may be said to *affect interstate commerce*. It is for Congress, and not for the created commissions or the courts, to decide what jurisdiction should be delegated, and, as stated by the lower court in its opinion in this very case, "the Commission does not have *express or implied* rate regulatory jurisdiction of the production and gathering of gas."

(i) As found by the Commission, (R., V. 1, p. 143), as of December 31, 1939, Canadian held gas leaseholds on approximately 300,000 acres of land located in the Texas Panhandle Field in the State of Texas on which it had in operation a total of 94 gas wells. Its gathering system consists of 144 miles of various size of pipe, all located in the State of Texas. The gathering system has two termini. One terminus is located in what is known as the Bivins Station in the State of Texas. At this point the gas there gathered is compressed and then transported by Canadian through its own transmission pipe line to Clayton Junction, near Clayton, New Mexico, at which point it sells the gas so transported to Colorado Interstate Gas Company, and the latter company then transports such gas through its "Denver Line" and sells the same at various points in the State of Colorado. The other terminus of Canadian's gathering system is located at what is known as Fritch Station, also in Texas. At this point the gas there gathered is compressed and then transported by Canadian through facilities leased from Texoma Natural Gas Company to a point in Oklahoma known as Gray Junction where the gas so transported is also sold to Colorado Interstate Gas Company.

As shown from the above and as stated by the Commission in its Opinion (R., V. 1, p. 143), it thus appears that

Canadian is engaged in several different and distinct business operations or functions: (a) Production, (b) gathering, (c) transportation, and (d) sale of natural gas. In addition to the sale of natural gas to Colorado Interstate at Clayton Junction, New Mexico, and at Gray, Oklahoma, Canadian also sells natural gas to Amarillo Oil Company at the wells in the field for the cities of Amarillo and Channing, Texas, and along its pipe line for the Dalhart, Hartley and Texline, Texas, markets. It also sells a quantity of gas to Clayton Gas Company, with deliveries at the Clayton, New Mexico town border. (R., V. 2, p. 708)

The gas sold by Canadian to Colorado Interstate is so sold pursuant to a term contract between the two companies, dated January 3, 1928. (Ex. 16, R., V. 2, pp. 711-780) It is the compensation which Canadian is entitled to receive under this contract which, among other things, includes the price of the gas, which the Commission, by its rate reduction order, requires to be reduced in the amount of $551,000 annually. Among other things, this contract, known as the Cost Contract, for the compensation therein provided to be paid Canadian and which compensation has been reduced to the extent above stated by the Commission's order, requires Canadian to acquire, maintain and develop a substantial block of gas leaseholds, to drill and operate wells, to construct and operate gathering facilities, to pay off funded debt in fixed amounts at fixed times, and to sell gas to others only as permitted by Colorado Interstate.

(j) An important fact in consideration of the question presented is that there is a commodity market value for Canadian's natural gas in the field where produced and at the end of the gathering system termini. The uncontradicted evidence in this case introduced by Canadian's witnesses (R., V. 6, pp. 3256, 3280) and corroborated by the Commission's own witness (Ex. 168, Sheets Nos. 113, 114, and 127; R., V. 6, p. 3281) establishes the market value of Canadian's gas at the wellhead in the field at 4¢ per Mcf. (16.4-pound pressure base) and the fair market value of natural gas gathered and delivered at the Bivins Station (one end of the gathering system termini and the beginning of the transportation system) to be 7¢ per Mcf.

We respectfully but earnestly submit that the Commission could keep within its delegated jurisdiction over interstate transportation and sale and not usurp an undelegated jurisdiction over production and gathering by using the commodity value of Canadian's natural gas at the end of the gathering system which is the beginning of the interstate transportation system as its jurisdictional starting point. The existence of a commodity value of the gas is in itself a complete answer to the Commission's contention that rate regulatory jurisdiction over the production and gathering properties, facilities and business, although withheld by Congress, is essential to an exercise of its delegated rate regulatory jurisdiction over interstate transportation and sale. So this case, or any similar case, need not be approached with the apprehension that if the Congressional mandate is followed and the Commission denied the right to exercise rate regulatory jurisdiction over production and gathering, the Commission will be unable properly to fulfil its delegated duties over interstate transportation and sale.

(k) As indicating the all-inclusive jurisdiction exercised by the Commission in this case over all of Canadian's properties, facilities and business, including not only its interstate transportation and sale but also its production and gathering, the following is noted which appears in the record in this case:

1. In arriving at its rate reduction order the Commission determined a rate base which includes not only Canadian's interstate transmission system but also its production and gathering properties. (R., V. 1, pp. 144-195; V. 5, pp. 2717-2721)

2. In determining its rate base for Canadian's producing and gathering properties the Commission applied its so-called original cost or prudent investment theories and in so doing totally ignored the true value of such properties as well as the actual cost thereof to Canadian.*

* The Commission deducted $3,864,357 from Canadian's original cost, practically all of which is applicable to leaseholds. (R., V. 1, pp. 149-151) This is discussed under "Question 3" infra. The Commission included Canadian's bare leaseholds in its original cost rate base at a value of something less than $1,000,000, and in so doing totally ignored unrefuted evidence of the present market value of such leaseholds in excess of $15,000,000. (Ex. 181, R., V. 6, pp. 3181-3254; Ex. 146, Sheets 62-64; R., V. 5, pp. 2717, 2721; R., V. 1, p. 186.)

3. In its rate base for production and gathering properties the Commission determined and included an allowance for working capital which it deemed sufficient to enable Canadian to carry on its production and gathering operations, and likewise the Commission has purported to determine in its rate base for production and gathering properties what additional wells should be drilled and what additional gathering facilities should be installed in the future. (R., V. 5, pp. 2536-2556)

4. After finding Canadian's total rate base to be $9,375,000 (R., V. 1, 187), of which approximately two-thirds represents production and gathering properties, (R., V. 5, 2717-2721), (even on the Commission's basis of determining a rate base), the Commission then found that Canadian was entitled to a return of 6½% per annum upon its total rate base (R., V. 1, 187), more than two-thirds of which, as above stated, is attributable to the hazardous business of discovering, exploring, developing and operating natural gas production properties.

5. The Commission has determined and made an allowance for Canadian's total annual operating expenses (including depreciation and depletion), the greater portion of which represents the cost of producing and gathering natural gas. (R., V. 1, 171; V. 4, 2341-2345).

6. After determining the total annual income of Canadian from all sources, the greater portion of which represents the cost of producing and gathering natural gas under its Cost Contract with Colorado Interstate, the Commission has deducted its determined annual operating expenses (mostly production and gathering) from such total income, and then, after making a return allowance of 6½% upon its determined rate base (mostly production and gathering), it has found an alleged excess income being received by Canadian, which forms the basis for its rate reduction order.

7. The Commission's order changes and abrogates the amount of compensation which Canadian is entitled to receive from Colorado Interstate under its Cost Contract, which compensation represents cost reimbursement to Canadian not only for the cost of current deliveries of gas to

Colorado Interstate, but also for the cost of performing various other services under the Cost Contract relating to Canadian's production and gathering properties and operations, such as the maintenance of leaseholds, the drilling of wells and the construction of gathering facilities as directed by Colorado Interstate.

(4) Notwithstanding all of the above and its own ruling that the Commission does not have either express or implied rate regulatory jurisdiction over production and gathering, the Circuit Court in its Opinion (142 Fed. (2d), p. 952) sustained the Commission's rate reduction order upon a novel theory stated as follows:

"Canadian is engaged in the business of producing, gathering, transporting and selling interstate natural gas for resale for ultimate public consumption. It therefore is a natural gas company, subject to the jurisdiction of the Commission in respect to its rates and charges for the gas transported and sold in such commerce. Its production and gathering properties and facilities are parts of its integrated operations. Still, under section 1 of the Act they lie beyond the range of the rate-regulatory jurisdiction of the Commission. But the Commission did not prescribe charges for the production; did not fix rates for the gathering of gas; and did not exercise other rate-regulatory jurisdiction over production or gathering as such, within the meaning of the limiting and forbidding provisions of the Act. The Commission did not attempt to affect in any manner the acquiring and maintaining of gas leaseholds, gas rights, or gas wells. Neither did it undertake to affect anywise the location, construction, extension, or physical connections of pipelines, or the operation of pipelines or other facilities constituting the gathering properties. The rate-regulatory jurisdiction of the Commission was exerted only in respect to rates and charges for natural gas transported in interstate commerce and sold in such commerce for resale for ultimate public consumption. The Commission inquired into and considered the production and gathering properties in respect to cost, depreciation, operating expenses, and revenues. But the inquiry was merely in their relation to the fixing of rea-

sonable rates to be exacted and received for the natural gas moved in interstate commerce and sold for resale. And the order of the Commission in each instance operated only upon such rates and charges. We fail to find in the act anything which expressly or by fair implication indicates a Congressional purpose to restrict or withhold from the Commission jurisdiction in a case of this kind to take into consideration the production and gathering properties only as they have bearing upon the question of the fixing of reasonable rates for gas moved interstate and sold for public consumption.'" (Pages 952, 953)

The Commission itself, either in its own Opinion or in its briefs filed in the Circuit Court or in this Court in connection with the petition for writ of certiorari, contends for no such theory, but boldly admits that it did exercise rate regulatory jurisdiction over Canadian's production and gathering and claims to possess such jurisdiction.

We respectfully submit that while the Circuit Court in one breath nominally purports to reject the Commission's jurisdictional contention, it does in its final and effective breath sustain the Commission's position notwithstanding the clear and positive provisions of the Act and the holding of this Court in the Hope Case. We submit it approaches absurdity to state that the Commission does not have rate regulatory jurisdiction over production and gathering and at the same time to rule that rate regulatory jurisdiction is not exercised where the Commission includes production and gathering properties in a rate base; where it applies its own formula of original cost or prudent investment to production and gathering properties; where it includes production and gathering expenses in its estimate of future expenses; where it allows working capital for the production and gathering business, and considers and determines what wells are to be drilled in the future; and finally, where, in determing an alleged excess revenue, it applies a 6½% rate of return not only to the transmission system properties but also to the production and gathering properties which constitutes approximately two-thirds of the total rate base as determined by the Commission. Obviously the Commission has treated every element of Canadian's production and gathering prop-

erties, facilities and business in precisely the same manner as its interstate transmission properties, facilities and business, and has subjected every element of Canadian's production and gathering facilities to the same rate regulatory measures and procedures as Canadian's interstate transmission properties, facilities and business for the purpose of arriving at its ultimate conclusions with respect to rates and charges. If the Act had expressly delegated full and complete rate regulatory jurisdiction over Canadian's producing and gathering properties, facilities and business, the Commission could have done no more than it has done in this case. The Circuit Court's opinion is inconsistent and contradictory. Its effect, not only in the instant case but also in all other cases, if allowed to stand, is to vest complete rate regulatory jurisdiction over production and gathering and thus to assume and exercise a legislative veto power over an express and unambiguous Act of Congress.

We again emphasize that natural gas is a commodity, that the market value of that gas as a commodity at the wellhead and at the end of Canadian's gathering system, which is the beginning of its interstate transmission system, was established by uncontradicted evidence. The whole theory and purpose of the Act and the express Congressional intent set forth therein can be sustained, served and followed if this established commodity value of the natural gas be used as the starting point of the Commission's jurisdiction. In such event by using that commodity value as its jurisdictional starting point the Commission can properly proceed with an exercise of its delegated rate regulatory jurisdiction over the interstate transportation and sale of that gas.

In conclusion we urge that the Commission's action in this case and the Circuit Court's affirmance thereof are in direct conflict with the Act and with the opinion of this Court in the Hope Case, and that the matter is of such great public importance not only to the natural gas industry itself but also to the public at large that this obvious unwarranted assumption of jurisdiction on the part of the Commission should not be allowed to become the law of the land without at least a consideration of the matter by this Court.

QUESTION NO. 2.

Question No. 2 set forth in the Petition for Writ of Certiorari is as follows:

> "2. Whether, even assuming, arguendo, that the Commission has rate regulatory jurisdiction over Canadian's production and gathering properties, facilities and business, the Commission can, consistently with the Fifth Amendment to the Constitution of the United States, the requirements of the Act, and the decisions of this Court in the Natural Gas Pipeline, Hope and other cases, limit Canadian generally to a return only on the 'wildcat' or original cost of its gas leaseholds to predecessor companies prior to discovery and development over 20 years ago, to the exclusion of all evidence of value, market or otherwise, the result of this procedure being, among other things, the inclusion in the Commission's rate base of a substantial block of Canadian's most valuable leaseholds at zero valuation and a still larger block of valuable leaseholds at only 10¢ per acre valuation."

It is our definite position, raised in Question No. 1, that the Commission does not have rate regulatory jurisdiction over the production and gathering of natural gas and that its delegated jurisdiction over interstate transportation and sale can fully, adequately and properly be exercised by determining the commodity value of the natural gas at the end of the transmission system, which is the beginning of the interstate transportation. This clearly was the Congressional intent in expressly withholding rate regulatory jurisdiction over production and gathering from the Commission. Such a logical and practicable procedure would render it unnecessary to rely upon the inconsistent and contradictory subterfuge found in the Circuit Court's Opinion quoted above which denies jurisdiction and upholds Congress with one hand and at the same time legislates jurisdiction and thwarts Congress with the other hand.

Even, however, if it be assumed, arguendo, that by whatever name it may be called, rate regulatory jurisdiction is to be exercised over production and gathering, still we submit it is entirely improper for various reasons hereinafter men-

tioned to include natural gas leaseholds in a rate base at original cost and to allow a return based upon such original cost.

We are not arguing here the question as to whether for the ordinary class of public utility property, original cost or something else should be the foundation of the rate base. Natural gas leaseholds constitute a class of property unique in itself and what may be a permissible or logical theory of a rate base for the ordinary utility property can have no proper application to gas leaseholds. Certainly there is nothing in the Natural Gas Act which requires the Commission to use original cost in including natural gas leaseholds in a rate base, even assuming that the Commission has rate regulatory jurisdiction over those leaseholds. Again, when this Court in the Natural Gas Pipeline and Hope cases stated that the Commission is not bound to any single formula or combination of formulas, it certainly did not intend to limit the Commission to an original cost formula in all cases. On the contrary, the "end result" and "rate impact" principles announced by this Court in these two cases would seem to make it absolutely clear that an original cost rate base as applied to natural gas leaseholds is not only in conflict with the basic theory of the Natural Gas Pipeline and Hope cases, but condemned by the "rate impact" and "end result" principles announced therein.

We submit that, except in an isolated instance as the result of accident, an original cost rate base as applied to natural gas leaseholds can never be fair to either the owner of the leaseholds or the public, and cannot, except accidentally, result in just and reasonable rates, as required by the Act. This can be demonstrated by a few general examples before coming to the particular situation which exists in the instant case.

A gas company, with $10,000,000 capital to spend in attempting to secure production, spends $9,000,000 of it around the country in geologizing, leasing, drilling and related matters, without success. With its last million dollars it acquires some leaseholds which prove productive. Under the Commission's original cost theory the company would be limited to a 6½% return on this last million dollars. No

consideration at all is given to the fact that it actually cost the company $10,000,000 to secure this one producing field. Such a theory must necessarily retard, if not eventually entirely terminate, attempts to locate and develop new fields to the obvious prejudice of the general public.

Again, A and B acquire adjoining gas leasehold acreage of the same size: A, at a cost of $1,000,000; B, at a cost of $100,000. Both prove productive. The gas produced from each as a commodity and on a competitive basis is of the same market value. Under the Commission's original cost theory A will be allowed a 6½% return on $1,000,000, and B a 6½% return on $100,000, and thus as far as the inclusion of the leaseholds is concerned, the consuming public will be required to pay ten times as much for A's gas as for B's, even though they both have the same market value.

A final example: A, mentioned above, with his $1,000,000 investment, develops a property containing a reserve of, say 10,000,000 Mcf. B, with his $100,000 investment, develops a reserve of 50,000,000 Mcf. Certainly, notwithstanding the difference in the investment or original cost, B's property is much the more valuable, and yet again, under the Commission's original cost theory, B will be limited to a 6½% return on his $100,000 as against ten times that much for A.

We submit that such a blind application of the Commission's original cost theory is unsound, impracticable, violative of the Fifth Amendment, must necessarily result in untold confusion, and cannot possibly result in just or reasonable rates either from the viewpoint of the owner of the leaseholds or the consuming public.

Of course, as we have urged above, this whole question can be avoided and order brought out of chaos if the Commission shall be held to its delegated jurisdiction and not attempt to include production and gathering properties in a rate base, but use the market value of the gas as a commodity as its jurisdictional starting point.

Other facts pertinent to this question and relating to Canadian's general picture are set forth infra in connection with "Question No. 3.". Without citing or quoting the detailed evidence, we call attention to the following which ap-

pears from the record in this case clearly showing the impropriety, if not the illegality and unconstitutionality, of including natural gas leaseholds in a rate base at original cost.

An analysis of the testimony of Commission witnesses, which the Commission adopted substantially (Ex. 146, Sheets 62-64; R., V. 5, 2717-2725), shows that the Commission used the sum of $1,604,020.61 as the starting point for its findings as to original cost of or investment in Canadian's leaseholds as of December 31, 1939. Then, as appears from Paragraph 8 of the Commission's formal findings (R., V. 1, 186), a deduction of $653,681 was made for depletion. This means that Canadian's bare leaseholds have been included in the Commission's original cost rate base at a value of something less than $1,000,000.

In adopting this valuation for rate base purposes, the Commission has wholly ignored substantial and uncontradicted evidence that "the present market value of Canadian's leaseholds" (excluding wells) is the sum of $15,646,787.64. This evidence is the testimony of Canadian's witness Wallace. (Ex. 181; R., V. 6, 3181-3254).

The Commission has found that Canadian's recoverable gas reserves are 2,800,000,000 Mcf. (R., I, 159). Reducing these figures so found by the Commission to its *value of the gas in place*, it appears that the Commission, in effect, has found the present value of the gas in place, to be only 34/1000ths of one cent per Mcf. On a comparative basis, and using Wallace's $15,646,787.64 valuation as applied to the Commission's finding of 2,800,000,000 Mcf. recoverable reserve, the value of the gas in place is approximately 1½¢ per Mcf.

The original "wildcat" cost to Canadian's predecessors in interest of five important leaseholds, containing approximately 47,000 acres, allowed by the Commission is $4,244.24, which is less than 10¢ per acre. (R., V. 5, 2735, 2736, 3051) Three of these leases are included at *zero valuation*. The present fair value of these same five leaseholds (exclusive of wells), as testified to by Wallace with supporting evidence as to such value, was $3,345,923. (R., V. 5, 3237, 3243) A similar situation exists in respect to the Commission's valua-

tion of the remainder of Canadian's leaseholds. (R., V. 5, 3051)

The Commission has wholly ignored all evidence of the market value of gas at the wellhead in the Texas Panhandle Field as a measure of the value of said leaseholds. Canadian's General Superintendent Ford testified that the market value of gas at the wellhead in the Texas Panhandle Field is not less than 4¢ per Mcf. on a 16.4-pound pressure base, or not less than 3.6¢ per Mcf. on a 14.65-pound pressure base. (R., V. 6, 3255-3281) This testimony was corroborated by Wallace, and by Commission's Exhibit 168, Sheets 13 and 127. (R., V. 6, 3281)[2] Ford's uncontradicted testimony showed the market value of Canadian's gas as a commodity at the Bivins Station (end of the gathering line and beginning of the interstate transmission line) to be 7¢ per Mcf. on a 16.4-pound pressure base, or approximately 6.3¢ per Mcf. on a 14.65-pound pressure base. (R., V. 6, 3255-3281)

It happens in this particular case that the application of the Commission's original cost theory to Canadian's gas leaseholds operates to the prejudice of Canadian. It might well have been the other way, in which event because of a high original cost the consuming public would be compelled to pay a higher rate notwithstanding the fact that the market value of the gas as a commodity would be the same, irrespective of the original cost of the leaseholds.

We submit that any theory which must end in such absurd results is inherently unsound and in conflict with the Fifth Amendment and violative of the principles announced by this Court in the Natural Gas Pipeline and Hope cases

[2]The Commission has found that Canadian's remaining recoverable reserves as of December 31, 1939, are not less than 2,800,000,000 Mcf.; that Canadian's future rate of production will be approximately 55,000,000 Mcf. (14.65-pound pressure base) per year; (R., V. 1, 159); and that on that basis Canadian's recoverable reserves will last for 63 years. The gross value of the 55,000,000 Mcf. to be so produced annually at 3.6¢ per Mcf. is $1,980,000. The Commission has found (R., V. 1, 171) Canadian's annual operating expenses to be $1,169,096, which includes gathering expense and transmission expenses, as well as producing expense. Even if all of this expense, however, be attributed to the production of gas at the wellhead and be deducted from the gross annual value of $1,980,000, there remains a net income of $810,904 for Canadian's gas production in one year, which is almost as much as the Commission has allowed in the rate base for the total of Canadian's leaseholds for all time.

and the question presented is of such over-all general importance as to justify and demand an exercise of the supervisory jurisdiction of this Court.

QUESTION NO. 3.

"3. Whether, even assuming *arguendo*, that the Commission has rate regulatory jurisdiction over Canadian's production and gathering properties, facilities and business, and further assuming, *arguendo*, that it is proper in this case to include Canadian's leaseholds and wells in the rate base on the basis of original cost, the Commission can, consistently with the Fifth Amendment to the Constitution of the United States, the requirements of the Act, and the principles announced by this Court in the Natural Gas Pipeline, Hope and other cases, disallow and eliminate more than $3,000,000, plus interest during construction paid thereon, from the amount actually invested by Canadian in its original acquisition of production properties in about 1928 solely upon the ground that the sum so eliminated allegedly represented a profit between affiliated companies, and, therefore, formed no proper part of the cost of said properties, where the Record clearly demonstrates that the transaction resulting in the acquisition of said properties was not between affiliates and that the price paid therefor was not excessive."

The Commission in this case deducted from the actual investment of Canadian in gas leaseholds the sum of $3,370,817, as more fully hereinafter shown, on the ground that such sum represented "affiliated company profits" and, in addition thereto, the sum of approximately $245,000 interest during construction on such alleged profits. (R., V. 1, 149-151) In making this deduction from the actual investment in gas leaseholds, the Commission relegated Canadian to the provable costs of such leaseholds incurred by Amarillo Oil Company and its predecessors in title, which was the cost of such leaseholds prior to the time that any wells had been drilled thereon and prior to the time that it was definitely known whether any gas would ever be produced therefrom. At the time that many of said leaseholds were acquired the nearest oil and gas production was 200 miles

away. The Commission gave no consideration whatsoever to the fact that the leaseholds when acquired had little or no value and, therefore, only a nominal sum was paid for the same and wholly ignored the fact that said leaseholds possessed great value after the discovery of gas thereon and that such discovery and the increase in value necessarily preceded any use of the same for any character of public service. The Commission ignored the fact that said leaseholds were acquired by Canadian approximately 10 years after the original discovery of gas under such leaseholds and at a time when such leaseholds had a value far in excess of the original acquisition cost in their then "wildcat" and undeveloped state. The Commission also ignored the fact that the purchase of said leaseholds by Canadian resulted from an arm's length transaction, and also ignored the fact that there was no intimation whatsoever in the Record that Canadian paid an excessive price for such leaseholds. The action of the Commission, if carried to its logical conclusion, would deny the prospector or "wildcat" oil and gas operator the fruits of his discovery, whether the properties were sold or operated by him, and would necessarily limit him to the actual outlay of cash, without profit, in an extremely hazardous enterprise.

In 1917, over 27 years ago, a few ranchers and small business men residing in and about Amarillo, Texas, incorporated and organized a small corporation called "Amarillo Oil Company" (hereinafter referred to as "Amarillo") for the purpose of drilling a "wildcat" well for oil and gas in what has now become the great Texas Panhandle Field. (R., V. 5, 2837, 3040) At that time there had been no discovery of oil or gas within 200 miles of the proposed well location. (R., V. 7, 3673) Consequently the cost to Amarillo of assembling the block of leases to be tested was purely nominal, except for drilling obligations. It was this purely nominal cost and no more that was included by the Commission in Canadian's rate base for such leaseholds as such, exclusive of development costs.

After many unfortunate experiences, financial and otherwise, the "wildcat" test well was finally completed in the fall of 1918 as a gas well—the first commercial producer of either oil or gas in the Texas Panhandle Field. From

that humble and successful "wildcat" beginning, the Field has been subsequently developed by the drilling of successful test wells, until it now contains approximately 1,500,000 proven acres of gas lands on which there are located approximately 1,650 wells producing gas only and approximately 4,200 wells producing both oil and gas. (R., V. 1, 409) Canadian's acreage produces no oil.

As of August 1, 1924, Amarillo owned approximately 46,803 acres of developed leaseholds in which it had a total provable cost for the leaseholds as such, exclusive of the wells that had been drilled thereon, of approximately $4,244, or less than 10¢ per acre. (R., V. 6, 3038, 3051, 3040) As of that date it acquired 244,114 acres of leaseholds from Mountain States Gas Company, upon which wells had been drilled or were then drilling, and from that date to May 1, 1927, it acquired 3,998 acres from various other persons. (R., V. 6, 3051) It also acquired 30,235 acres from Mountain States which were classed as unoperated leaseholds, being leaseholds upon which no wells had then been drilled. (R., V. 6, 3063)

The leaseholds acquired from Mountain States Gas Company were paid for through the issuance of common stock. Such leaseholds had been acquired by Mountain States in an undeveloped "wildcat" stage and at the time of the acquisition by Amarillo there were located on such leaseholds five wells capable of producing natural gas and four wells that were then drilling which were later completed as gas wells. (R., V. 6, 3043) No gas had been sold from said leaseholds prior to that date. The total cost to Mountain States and its predecessors in title for the acreage acquired by Amarillo was $273,095.88 for the 244,114 acres of operated gas leaseholds, which included, however, approximately $76,318 for well drilling costs. (R., V. 6, 3041, 3042) When this sum is eliminated, the original acquisition cost of said leaseholds approximated $200,000, or less than $1.00 per acre. In fact, the largest leasehold involved, being the Bivins A 30, comprising 200,000 acres, had a provable cost to Mountain States of only $105,000 for the leasehold as such. This provable cost of less than $1.00 per acre was the entire amount included in the rate base for this block of very valuable leaseholds, exclusive of development costs.

The leaseholds above referred to that were included in the rate base for only a very nominal sum, and on the basis of their original "wildcat" provable costs, plus a very small amount of additional acreage, had an actual value of approximately $15,646,787.64 for the leaseholds as such, exclusive of all well costs, according to the uncontradicted testimony of Wallace. (R., V. 6, 3181-3254) Excluding the additional acreage the leaseholds above referred to had a minimum value of not less than $15,000,000 and were included in the rate base at a figure but little, if any, in excess of $300,000.

In 1924 Southwestern became the owner of all of the capital stock of Amarillo. Amarillo then owned leaseholds aggregating in excess of 300,000 acres. Additional test wells had been drilled and additional natural gas production had been developed.

It became apparent in 1927 that if Amarillo were to realize upon its extensive gas properties it must develop new markets of a substantial nature. Its only market at that time was for relatively small volumes at the wellhead for the City of Amarillo, Texas, and vicinity and one industrial sale at a plant near Amarillo. It had one well with a capacity substantially in excess of the volume required to supply its entire available market. (R., V. 1, 459)

Neither Amarillo nor its parent, Southwestern, had had any experience in the transportation of gas by pipe line over long distances and they also lacked the necessary capital with which to construct such a pipe line. (R., V. 1, 402, 403) The City of Denver, located a distance of approximately 350 miles from the Texas Panhandle Field, and intervening territory seemed to be the closest available market for natural gas in substantial quantities. (R., V. 1, 402) Southwestern approached Standard Oil Company (New Jersey) regarding the construction of a pipe line project to Denver and intervening territory. (R., V. 1, 403) Standard, after investigation, determined that the project was feasible and interested Cities Service who controlled the markets in Colorado. (R., V. 1, 403)

Negotiations were then commenced for the purchase of the gas leaseholds and wells of Amarillo, which negotiations

finally resulted in a contract dated April 5, 1927, whereby Amarillo was to receive $5,000,000 for its gas leaseholds, rights and wells. (R., V. 1, 403-416) *Neither Standard nor Cities Service had any interest whatsoever in either Amarillo Oil Company or Southwestern on that date (April 5, 1927), prior thereto or subsequent thereto. There was no corporate affiliation between any of the three participating companies which executed the contract of April 5, 1927.* (R., V. 1, 460, 613-622) *The contract was entered into only after long and continued arm's length negotiations between the parties.* (R., V. 1, 493-526) In accordance with the terms and provisions of said contract, Southwestern obligated itself to organize and incorporate a company (now Canadian), *separate and apart from its other companies and projects*, to which it would cause Amarillo Oil Company to convey, free of all debts, liens and encumbrances, all of the latter's gas leaseholds, rights and wells in the Texas Panhandle Field at the agreed price of $5,000,000. (R., V. 1, 381-400)

There were no negotiations whatsoever between Amarillo and Canadian with respect to the $5,000,000 transaction. Canadian was not actually organized until January, 1928, almost a year after the consideration had been agreed upon. (R., V. 1, 455) Amarillo, however, agreed and consented to carry out the agreement that Southwestern had made for it. (R., V. 1, 455, 456)

Southwestern, sitting on one side of the table, making the deal above referred to, had every incentive to get just as much as it could for the leaseholds, rights and wells of Amarillo and it tried to get more than $5,000,000. Likewise, Standard, on the other side of the table, which was not interested in Southwestern and which furnished all the money, had the incentive to bear down as much as it could on the price and actually tried to acquire the properties for less than $5,000,000. (R., V. 1, 460, 520) The negotiations with respect to the acquisition of the leaseholds covered a period of many months in 1926. (R., V. 1, 520-521)

The $5,000,000 paid by Canadian for the leaseholds was advanced in its entirety by Standard. (R., V. 1, 459) * * * Southwestern Development Company was not taking five million dollars of its own funds and paying it to its own

subsidiary. * * * It got five million dollars of outside money." (R., V. 1, 450) Notwithstanding the arm's length character of the transaction which resulted in the sale by Amarillo and the purchase by Canadian, the Commission, nevertheless, ignored the entire transaction and determined that the provable costs of Amarillo Oil and its predecessors in title aggregated approximately $1,850,000, or about $3,250,000 less than the sum actually paid by Canadian. (R., V. 1, 150) Most of such provable costs, however, resulted from the drilling of gas wells and other costs incidental to the development of such leases. The provable cost of leases as such was very nominal as is hereinabove pointed out.

In arriving at such provable costs, the Commission ignored, among other things, the following:

1. A sum in excess of $50,000 expended in drilling a dry hole which was one of the early exploratory wells. (R., V. 5, 2850; V. 6, 3111, 3112) This well was as much a part of the development cost as the producing wells, but its cost was eliminated apparently because no one should be so foolish or imprudent as to drill non-producing wells.

2. $35,000 for interest on idle investment prior to October, 1920, when the first small volume of gas was sold. (R., V. 6, 3110-3111)

3. General overhead and administrative costs estimated at $68,000. (R., V. 6, 3108-3110)

4. Delay rentals paid on undeveloped leaseholds in a sum in excess of $488,000. (R., V. 6, 3106-3108)

If the principle of prudent investment as construed and applied by the Commission in this case to a mining enterprise such as the acquisition of "wildcat" oil and gas leases in an area more than 200 miles from known oil or gas production is followed consistently, it would result in the "wildcatter" or prospector being denied the value created by his discovery. This is true because if he attempts to sell the gas as such in interstate commerce for resale, the Commission, as it did in this case, would allow him only the provable "wildcat" costs of such leaseholds. If on the other hand he desired to sell the leaseholds to a company such as Canadian who desired to produce the gas and sell

he same for resale in interstate commerce, such company ould not afford to pay any more than the provable costs f such leaseholds in their "wildcat" state since the earnngs would be limited to such provable costs. Certainly, it annot be said that the gas consuming public is entitled to ave rates fixed on any such basis, and, certainly, it cannot e said that rates fixed upon such basis are fair to the owner f the gas producing properties. In this case the Commission, through the application of accounting rules devised by t and which have no realistic application to a mining enterprise, actually excluded more than $600,000 as above pointed ut, most of which was excluded on the theory that they had ot been set up on the books in the first instance, notwithtanding the fact that such accounting procedure was unknown in so far at least as a mining enterprise was concerned at the time the expenditures were made. The delay entals in the sum of $488,000 were excluded by the Commission on the theory that Amarillo commenced selling some as in the Fall of 1920 and that such expenditures were ubsequent to that date. Clearly, such expenditures were bsolutely necessary for Amarillo to keep its leaseholds in oree and effect and were as much a part of the cost of such easeholds in a realistic sense as the original bonus price aid therefor. Clearly, the sum of in excess of $50,000 aid for a dry hole was also a real and definite cost incurred in the development of such properties. What incentive is there for a person to engage in the hazardous enterprise of drilling a "wildcat" well if he knows at the outet that if a well is dry he has lost the entire sum expended, ut if on the other hand he is successful and discovers gas, till he will be permitted only to earn on the actual cost ncurred in drilling the well, plus a small sum which he ight have paid for the leaseholds in their "wildcat" stage. his, of course, does not tell the entire story. He would ot even be permitted to recover the cost of drilling an exloratory dry hole. In other words, no one would be so olish to embark on such an enterprise. He could not reover his money back no matter how successful his exploraory operations might be, and even though he discovered ne of the greatest oil and gas fields that the world has ver known. Surely the Natural Gas Act does not require

and surely the Fifth Amendment prohibits any such irrational approach to the problem as this.

In addition to the original purchase from Amarillo, Canadian from time to time made other purchases of gas leaseholds, one of these being the purchase of the properties of Master Oil and Gas Company consisting of 5404.2 acres of leaseholds and two gas wells for the sum of $235,054.20. (R., V. 5, 2659-2661, 2815-2816) The Commission deducted from this purchase price the sum of $121,787. (R., V. 1, 150) This deduction was made on the ground that Prairie Oil and Gas Company owned 51% of the common stock of Master Oil and Gas Company and that N. K. Moody was a Director of both the purchaser and the seller. (R., V. 5, 2659-2661) No contention was made that the price was excessive. The Record is clear that in determining the so-called provable original cost of Master that Luttring, Commission witness, only went back to June 1, 1926, although the leaseholds were first acquired prior to 1920. (R., V. 5, 2659, 2823) There is nothing in the Record that would indicate that this was anything other than an arm's length transaction. There is no showing that the indirect relationship between Prairie and Canadian had anything whatsoever to do with the determination of the purchase price. Certainly, it cannot be said that Moody was in a position to in any sense dominate the a tion of the majority of the Board of Directors.

The Commission also deducted $244,853.26, being interest on the alleged excess over provable costs paid by Canadian to Amarillo. (R., V. 1, 149, Entry 249; V. 5, 2769) Obviously, if the entire $5,000,000 purchase price is allowed, the interest during construction actually paid upon this amount should also be allowed.

The Commission also deducted an additional sum of $128,000, being an alleged profit made by Mission Oil Company over and above actual provable costs (Mission is one of the predecessors in title of Amarillo). (R., V. 1, 150; V. 5, 3043-3051) Obviously, this deduction should not have been made if the full $5,000,000 purchase price is allowed.

The sum of the above deductions or eliminations by the Commission aggregates the sum of $3,615,670, which is ap-

proximately 36% of the entire undepreciated prudent investment rate base of Canadian as determined and allowed by the Commission (R., V. 1, 149) and almost 40% of the rate base determined by the Commission for Canadian in this case. (R., V. 1, 164)

The Circuit Court characterized the difference between the purchase price and the alleged provable original cost of predecessor companies as constituting a "synthetic inflation" and held in effect that the same was properly eliminated by virtue of *Pennsylvania Power and Light Company v. Federal Power Commission*, 139 Fed. (2d) 445, (certiorari denied). This case has absolutely no relevancy to the facts in the case at bar. It involved merely the proper method of keeping accounts by licensees under the Federal Water Power Act, which Act determines how such accounts should be kept. There is no such provision in the Natural Gas Act. In addition to this, however the *Pennsylvania* case involved a state of facts where a construction profit was being allowed to another company which was merely a puppet in the same holding company system. In fact, both parties were merely departments of one common holding company. That, of course, is not the situation with respect to Amarillo Oil Company. Amarillo acquired and developed the properties in question almost 10 years prior to the time they were sold to Canadian and in the interim increased the value thereof very materially as the result of exploratory drilling. The *Pennsylvania* case would be more nearly applicable on the facts if Amarillo had been employed by Canadian to go out and assemble the leaseholds after the Denver project had been inaugurated and then Canadian had paid Amarillo a profit for the work performed for it. It is too clear for argument that that is not the situation which now confronts this Court, yet that was the very situation involved in the *Pennsylvania* case. But even then, the case would not be applicable by virtue of the arm's length negotiations which transpired in the case at bar. Likewise, the various cases cited by the Commission in its answer brief to our petition for certiorari involved accounting principles for the most part by licensees under the Federal Water Power Act and also involve questions where a profit was made for actual construction work which was performed in reality by one department of a sys-

tem for another. Obviously, such cases have absolutely no relevancy to the facts in the case before the Court.

Even if the transaction whereby Canadian acquired the leaseholds and wells from Amarillo under the facts and circumstances existing in this case was one between affiliated companies, still the profit made by Amarillo Oil Company could not be condemned on that ground alone.

This very question has been recently decided by this Court in the case of *A. T. & T. Co., et al., v. United States, et al.*, 299 U. S. 232, 240, 81 L. Ed. 142. In that case Mr. Justice Cardoza, speaking for a unanimous Court, held definitely and positively that where properties were purchased from an affiliated company, or from a company that prior to the purchase had devoted such properties to a public use, that any profit made by the selling company could not be written off or ignored if, as a matter of fact, "*the difference between original and present cost is a true increment of value.*"

This principle has been reaffirmed in the recent case of *New York Telephone Company v. United States, et al.*, decided August 24, 1944, by a three Judge Court for the Southern District of New York. (Opinion not yet published) There was involved in that case the purchase of equipment by New York Telephone Company from its parent, the A. T. & T. Company. The latter company owned all of the common stock of the former. The book cost of the equipment involved to the A. T. & T. Company, less depreciation, aggregated $8,468,169.81 and was purchased by the New York Telephone Company for the sum of $12,634,680.38. The purchase price over the net book cost approximated $4,166,510.57. The Federal Communications Commission ordered the New York Company to write down the actual cost of the property in question to the net book cost of the selling company. The Court held that the purchasing company could not be required to write down the actual cost of the property if, as a matter of fact, it was worth the sum paid, citing the A. T. & T. decision by this Court referred to above.

It is true that these cases involve questions of accounting, but even so the underlying principle is applicable here. Cer-

tainly, there is no basis for eliminating almost $4,000,000 from the purchase price paid by Canadian to Amarillo if the principle decided by the above cases is sound. The entire $5,000,000 was actually paid and was paid in good faith and after prolonged negotiations between adverse parties. There is not even a suggestion that the property purchased was not worth every penny paid for it.

The *New York Telephone* case above referred to, being before a three Judge Court, will in all probability reach this Court by appeal. The issues in that case and in this case are so similar in principle that we earnestly contend that the scope of the review in this case should be enlarged to include this point 3 by virtue of the decision of the New York Court in the case referred to.

The Commission also relies heavily on the case of *Niagara Falls Power Company v. Federal Power Commission*, 137 Fed. 787, 793-794, (certiorari denied). That case involved the determination of the values of respective properties conveyed by the owners thereof to a common company and for which each of said owners accepted common stock in the same proportion that the value of the properties conveyed by each bore to the total value. In other words, this simply constituted a pooling of assets into one common operating company. No money whatsoever passed from the purchaser to the seller. Each of the so-called sellers still merely owned a portion of the combined assets. This was not true with respect to the sale by Amarillo to Canadian. Such sale did not constitute in any sense a pooling of assets, as suggested by the Commission. The purchase by Canadian was a condition precedent to the launching of the Denver project. The money paid belonged to Amarillo Oil Company and no contingency whatsoever could arise in the future which would affect its right to keep and retain the full purchase price. The project might have failed completely, but even so, Amarillo Oil Company would not have been affected, and neither would its parent, Southwestern, in so far as the $5,000,000 payment is concerned.

The pooling, if there were one, did not occur and could not have occurred until after provision had been made for the acquisition of the leaseholds and wells in question. If

we assume for the sake of argument that from that point on there was a pooling of assets, still this in no manner detracts from the fact that it was necessary for Canadian, as an alleged instrumentality of the project, to acquire from Amarillo the gas leaseholds and wells without which the project could not have been launched and without which no pooling of any character could have occurred. It was also necessary to pay to Amarillo the full $5,000,000 in cash, all of which was advanced by Standard and came from sources entirely outside of the Southwestern system. If we ignore the fact that the transaction at this stage was between non-affiliated concerns, still it makes no difference for the very simple reason that Southwestern had the perfect right to refrain from participating in the Denver project unless and until Canadian paid Amarillo $5,000,000 in cash for the properties acquired. The money paid was derived from sources entirely outside of the Southwestern system. The $5,000,000 belonged absolutely to Amarillo without regard to the future operations of the Denver project. The *Niagara Falls* case, therefore, and the principle decided there can have no relevancy whatsoever to this case.

As a matter of fact, the prudent investment theory, as applied by the Commission in this case, cannot be supported in any event if a rational view is taken with respect to the undisputed facts. Mr. Justice Brandies in his celebrated dissenting opinions defined original cost as the amount actually paid to establish the utility. He developed the theory that dollars were dedicated to the public service and not necessarily property. There is some reasonable and rational basis, of course, for this theory where the dollars invested actually constitute at the time the best evidence of value. That could not possibly be true in a mining operation such as this one where cost frequently has little relationship to value. The principle cannot apply also because the money invested by Amarillo and its predecessors in title in "wild-cat" leaseholds was not invested in any sense of the word in a public service enterprise. The investment was made in a mining enterprise and at a time and under such circumstances that it could not be known whether the property in question would ever produce natural gas. The great increase in value occurred by reason of the discovery of large

deposits of natural gas. This necessarily preceded any sale of gas in interstate commerce or otherwise. Therefore, Amarillo and the others did not invest money or dedicate money in a public utility or in a public enterprise of any character. It is true that when Canadian acquired the properties from Amarillo that it did so for the purpose of producing and selling gas in interstate commerce. This was the first time that any money was invested or dedicated with respect to a particular project of a public service character and is the very minimum dollar figure, therefore, that can be said to have been dedicated to a public service operation and represents the very minimum prudent investment or original cost figure that can be applied as of that date. The Court will bear in mind that even then the transportation and sale of gas in interstate commerce was not affected with a public interest and did not become so until the Natural Gas Act was passed in 1938.

If we assume, therefore, that the prudent investment theory may be applied to a natural gas production operation after discovery has already been made and where the properties were acquired for the purpose of engaging in a public service operation, still a rate base cannot be determined on such principles with respect to the producing leaseholds here involved, if a rational and realistic viewpoint is assumed.

This Court has said in the *Natural Gas Pipeline* and *Hope* cases that the Commission is not restricted to any particular formula or combination of formulas in arriving at a rate base. These opinions, however, clearly demonstrate that the formula or combination of formulas adopted by the Commission shall bear some reasonable relationship to the admitted facts in any given case. This is clearly demonstrated in the concurring opinion by Justices Black, Murphy and Douglas in the *Natural Gas Pipeline* case wherein it is stated: "The Commission has a broad area of discretion for selection of an appropriate rate base. * * * Various routes to that end may be worked out by the expert administrators charged with the duty of regulation. * * * *The decision in each case must turn on considerations of justness and fairness which cannot be cast into a legalistic formula.*" (pp. 606-607) (Italics supplied)

The "legalistic formula" adopted by the Commission for inclusion of Canadian's leaseholds in its rate base has resulted in the assignment of a zero valuation to some of Canadian's most valuable leaseholds and a value of only 10¢ per acre to a still greater block of important leaseholds, and a nominal value of not to exceed $1.00 per acre on the great majority of its leaseholds. The undisputed testimony demonstrates that these leaseholds were worth many millions of dollars, exclusive of the wells. Clearly, the Commission's "legalistic formula" in this case does not meet any test of "justness and fairness".

The fact that this Court has said that the Commission is not restricted to any particular approach for the purpose of determining a rate base does not mean that the Commission can close its eyes to the actual facts existing and produce a result entirely inconsistent with such facts and one which bears no reasonable relationship to the actual realities with respect to the problem before it. This is particularly true where the owners of leaseholds, as in this case, engaged in an extremely hazardous "wildcat" enterprise in search of oil and gas. They paid little for their leaseholds at the outset because such leaseholds had little or no value at the time of their original acquisition. The value was developed by exploratory operations and discovery, which preceded by almost 10 years the purchase of such leaseholds by Canadian, and which preceded by 20 years the enactment of the Natural Gas Act which for the first time subjected to regulation the transportation and sale of natural gas in interstate commerce for resale. Certainly, the public interest does not require that the consumers of natural gas produced from such properties be given the entire economic benefit resulting from the extremely hazardous undertaking involved in the discovery and subsequent production of natural gas under such circumstances. Certainly, no one will engage in the business of drilling a "wildcat" well 200 miles from any known oil or gas production, as Amarillo did, if the return upon such undertaking is to be limited literally to 6½% on the cost of the hole in the ground. We submit that neither the public interest nor the Natural Gas Act requires and the Fifth Amendment prohibits a rate regulatory process based upon any such theory.

The Commission, however, notwithstanding the above, suggests in its answer brief to our original petition for certiorari that the alleged profit made by Amarillo was carried on Canadian's books as "appreciation" and that no income taxes were paid on such profit. This has no significance whatsoever. At the time of this transaction, Southwestern had theretofore elected to file Federal income tax returns for itself and subsidiaries on a consolidated basis. Consequently, any profit realized by Amarillo in the transaction was eliminated for income tax purposes in the consolidated return. (R., V. 5, 2638) At the same time, however, such elimination of taxable profit resulted in a lower depreciation and depletion base for Canadian's future use for tax purposes which in the long run might require the payment of more, rather than less, Federal income taxes. This is the whole story concerning this transaction. Certainly, this method of handling the transaction for income tax purposes and for the purpose only of reflecting the depreciation base does not change the arm's length nature of the transaction as reflected by the uncontradicted evidence and, certainly, it does not in any way detract from the fact that Canadian in good faith paid $5,000,000 for the property, and neither does it detract from the fact that the property was worth every dime paid for it. This, as stated in the *A. T. & T.* and *New York Telephone* cases above referred to, is all that really counts. Neither does it indicate a write-up in any sense as intimated by Commission because, among other things, it did not result in any entry whatsoever in the surplus account. It would have been reflected there had it been a write-up. (R., V. 5, 2637) No matter how Canadian may have kept its books of account for tax or other purposes, and notwithstanding any evidence of the true arm's length character of the transaction, and of the true value of the property, it is obvious that the position of the Commission and its staff would have remained the same, simply because it was a transaction, they say, between affiliated companies.

We earnestly contend that the undisputed facts in this case demonstrate that the transaction whereby Canadian acquired the leaseholds, rights and wells of Amarillo was one between non-affiliated companies and that every safeguard necessary to insure a fair price and render the transaction invulner-

able was present and operating here. There is not an intimation in the Record that the price paid was excessive and, as a matter of fact, the evidence would justify a much higher consideration than that actually paid. There is not and could be no question with respect to devotion of such properties to a public use prior to the time that the sale was made. Amarillo's only sales were at the wellhead and to industrial consumers, neither of which is affected with a public interest. Furthermore, the sales made by Canadian in interstate commerce for resale were not affected with a public interest until the passage of the Natural Gas Act in 1938, 20 years after most of the property was acquired by Amarillo and its predecessors in title and more than 10 years after the purchase of the same by Canadian. We furthermore earnestly contend that in any event the undisputed facts and circumstances in this case demonstrate clearly that the prudent investment theory as developed, construed and applied by the Commission in this case produces such absurd and unrealistic results that it cannot be applied in this case for the purpose of determining the rate base of Canadian with respect to leaseholds as such. If such theory is to be applied at all, it cannot be applied to the "wildcat" cost of such leaseholds incurred by Amarillo and its predecessors in interest. The very minimum cost of leaseholds under such theory in any event with respect to the leaseholds acquired from Amarillo is the actual money paid therefor by Canadian in 1928. In other words, the full $5,000,000 paid for such leaseholds, rights and wells should be included in the rate base.

It is submitted that the action of the Commission and the affirmance of such action by the Circuit Court in eliminating almost $4,000,000 of Canadian's actual cash investment in its gas producing properties from its rate base and denying Canadian any return on such sum, as well as the right to recover such sum through the sale of gas, violates the provisions of the Fifth Amendment and the Act and is probably contrary to the decisions of this Court in the *Hope* and *Natural Gas Pipe Line* and other applicable cases hereinabove referred to. It is also submitted that the question here involved presents a Federal question of great and far reaching importance which has not been, but which should be, settled.

by this Court, and which question will likely arise in other cases in the administration of the Act; that the Commission in its action and the Circuit Court by its affirmance of such action have so far departed from accepted procedures as to call for an exercise of this Court's power of supervision; and that this Court, therefore, should grant this motion for re-hearing and enlarge the scope of review so as to include said Question No. 3 hereinabove quoted.

Respectfully submitted,

P. C. Spencer,

CERTIFICATE OF COUNSEL.

I, John P. Akolt, of the City and County of Denver, State of Colorado, being one of counsel for Canadian River Gas Company, petitioner in the above petition named, do hereby certify that the foregoing petition for rehearing of this cause is presented in good faith and not for delay.

John P. Akolt,
Attorney for Petitioner, Canadian River Gas Company.

No. 380

CANADIAN RIVER GAS COMPANY, a Corporation,
PETITIONER,

v.

FEDERAL POWER COMMISSION, CITY AND COUNTY OF DENVER, COLORADO, PUBLIC SERVICE COMMISSION OF WYOMING, COLORADO-WYOMING GAS COMPANY, PUBLIC SERVICE COMPANY OF COLORADO, and COLORADO INTERSTATE GAS COMPANY, RESPONDENTS.

PETITION OF CANADIAN RIVER GAS COMPANY FOR REHEARING AND FOR ENLARGEMENT OF TIME FOR ISSUANCE OF MANDATE AND STAY OF MANDATE.

The judgment of this Court was entered herein on April 2, 1945, such judgment being an affirmance of the judgment of the Circuit Court of Appeals for the Tenth Circuit (142 F. 2d, 943).

Petitioner now petitions this Court to grant a rehearing herein for the purpose of reconsidering the issues presented and the judgment entered and for enlargement of the time for issuance of mandate and stay of mandate until this petition for rehearing has been finally disposed of by the Court. In support of such petition, Petitioner respectfully shows as follows:

I.

The Division of the Court

The judgment of the lower court is affirmed in this case pursuant to an Opinion of the Court which was delivered by Mr. Justice Douglas on behalf of himself and three other Justices. In direct opposition to the Opinion of the Court is the dissenting opinion of Mr. Chief Justice Stone, in which he is joined by three other Justices. The affirmance of the lower court and the Commission's order, become effective only by reason of the concurring opinion of Mr. Justice Jackson.

II.

The Grounds of This Petition

Petitioner has reexamined and reviewed its argument before the Court in the light of the three opinions in the case, and has reached the conclusion that a reconsideration and reargument of the issues involved, particularly by reason of the views expressed and the position taken by Mr. Justice Jackson, might well lead the Court to arrive at a different conclusion. As shown hereinafter, this conclusion is founded upon the firm belief that Mr. Justice Jackson has unfortunately confused and intermingled the case of Petitioner with that of Colorado Interstate Gas Company, which, for convenience purposes, was included in the same Opinion of the Court; and that, as a result of such confusion, he has perforce, even though reluctantly, applied principles of law and reasoning which he would have not applied, but would have indicted, had he understood the facts correctly and considered Petitioner's case individually upon its own merits. The conclusion to file this petition is further strengthened and supported by the knowledge that the Court is dealing here with the determination and settlement of far-reaching issues which are not only of critical importance to Petitioner but of immediate and vital concern to the public.

III.

The Views and Position of Mr. Justice Jackson

It would appear from the concurring opinion of Mr. Justice Jackson (1) that he finds himself unable to join

in the dissenting opinion because, according to his view, the Commission's order has no *immediate* "impact" upon production and gathering of gas and consequently the Commission has not imposed any direct regulation upon such activities; (2) that he finds himself likewise unable to join in the Opinion of the Court because he has heretofore dissented, and still vigorously dissents, against the end result and other theories upon which it is based; and (3) that he then concludes to concur in upholding the Commission's order because in his opinion (a) "The court cannot, consistently with *Federal Power Commission v. Hope Natural Gas Co.*, 320 U. S. 591, do otherwise," and (b) notwithstanding his desire to reverse the case, he believes "a reduction in the wholesale rates for resale to the public is in order." Each of the above propositions will be discussed hereinafter in reverse order.

IV.

The Reasonableness of Petitioner's Rates

Apparently Mr. Justice Jackson was led to the finding that "a reduction in the wholesale rates for resale to the public is in order," so far as Petitioner is concerned, because of a seeming disparity between existing rates for regulated and unregulated gas. He points out that Colorado Interstate Gas Company (hereinafter called "Colorado Interstate") sells unregulated gas in large quantities to Colorado Fuel & Iron Company at Pueblo, Colorado, for various industrial uses at prices ranging from 9½¢ to 16¢ per MCF, whereas the same Company sells regulated gas at the Denver city gate for 40¢ per MCF.[1] No matter what

[1]While, as pointed out in the text, a comparison of Colorado Interstate's direct and resale rates has no pertinency to Canadian's situation and rates, it is submitted that, for reasons stated below the comparison of Colorado Interstate's rates, as made by Mr. Justice Jackson, is in itself erroneous.

During the year 1939 (the test year used by the Commission), the Commission found, as shown in Exhibit "A" to its Opinion and Order (R. V. 1, 181), that the average price for all gas delivered by Colorado Interstate to Public Service Company at Denver was 32 cents per MCF. Mr. Justice Jackson obviously overlooked reductions in the MCF price from 40 cents to 32 cents made prior to 1939.

Mr. Justice Jackson made a comparison between the rates charged the C. F. & I., which he stated to be 9½ cents per MCF for boiler gas and 16 cents per MCF for all other gas, and the rate being charged the Public Service Company at the Denver gate, which, as already pointed out, was

weight this character of evidence may be given as to the justness and reasonableness of Colorado Interstate's rates for regulated gas, however, it leads nowhere when applied to the gas sales of Petitioner, because (a) Colorado Interstate and Petitioner are two different and separately owned entities, owning and operating different and separate properties; (b) the Commission has entered a separate and distinct rate reduction order against Petitioner; (c) the Commission has held, and this Court has affirmed, that Petitioner makes no sales of gas in interstate commerce which are not subject to regulation by the Commission, and therefore Petitioner has no unregulated sales, so far as the Commission is concerned, except sales for resale at the well and from the pipeline within the State of Texas; (d) Petitioner makes no sales of gas to Colorado Fuel & Iron Company or any other sales of similar character; and (e) all sales of Petitioner's gas to Colorado Interstate for all purposes are made at one and the same uniform price, i.e., actual cost as computed under the Cost Contract between the parties.[2]

---

erroneously stated to be 40 cents per MCF instead of 32 cents, as found by the Commission. But a comparison of the rate charged the C. F. & I. with any rate hitherto charged the Public Service Company at Denver does not afford any test of the reasonableness of the rate ordered for the future, even as to Colorado Interstate.

Mr. Justice Jackson concluded that despite the obvious errors in the Commission's method, he would not vote to reverse the Commission's Order because the reduction did not appear to be unreasonable. The thing to be tested is the newly imposed rate, and that according to the Commission's own findings and Order, is now 15.4 cents per MCF. (R., V. 1, 181). Moreover, Denver is farther from the field by 105 miles; its gas is predominantly domestic and enjoys the highest priority on the pipe line facilities. Mr. Justice Jackson, while giving consideration to some economic factors justifying a difference in prices, failed, however, to give due weight to the important elements of load factor and priority and preference. We also point out in this connection that the 15.4-cent Denver rate ordered by the Commission, which is called the average cost per MCF, includes 6½% return.

It is, therefore, respectfully submitted that even as to Colorado Interstate, the reason assigned by Mr. Justice Jackson for not voting in favor of a reversal is based upon a misapprehension of the facts, and that he employed a wrong test in that he tested not the new rate, but the old.

[2]This Cost Contract between Canadian and Colorado Interstate, dated January 3, 1928 (Ex. 16, R. V. 2, 711-780) has been designated by the Commission as "F.P.C. Rate Schedule No. 1," and it is the compensation under this Cost Contract which the Commission's Rate Reduction Order requires to be reduced by $551,000 annually. This particular contract is unusual and is not the ordinary contract that courts or regulatory bodies are called upon to consider in rate regulation cases. In addition to requiring Canadian to currently sell and deliver to Colorado Interstate gas at

The record shows that for the year 1939, which was used by the Commission as the test year, Petitioner received from Colorado Interstate under the Cost Contract a price of approximately 5¢ per MCF for all gas produced, gathered, transported and then delivered to Colorado Interstate in New Mexico and Oklahoma, respectively.[1] It is submitted that there is nothing in these facts or elsewhere in the record to indicate that a reduction is in order as to Petitioner's wholesale rates for resale to Colorado Interstate. The uncontroverted evidence in the record shows that the fair market value of Petitioner's gas in the Texas Panhandle Field arrived at through competitive arm's-length bargaining is 4¢ per MCF at the wellhead and 7¢ per MCF at Bivins Station, which is the end of gathering operations and the beginning of transmission operations (R., V. 6, 3256, 3280; Ex. 168, Sheets 113, 114; R., V. 6, 3281). It should be noted that whereas the reduction ordered by the Commission was $2,065,000 in the case of Colorado Interstate, it was only $561,000 in the case of Petitioner (R., V. 1, 188, 191). This Court could reverse Petitioner's case and still, on the basis of its judgment in the Colorado Interstate case, there would remain in effect a reduction in excess of $1,500,000 for the customers of Colorado Interstate. A reduction even in this amount would result in a gate rate at Denver less than the 24¢ price computed by Mr. Justice Jack-

---

Canadian's cost, the Contract obligates Canadian to acquire, maintain and develop a substantial block of gas leaseholds, to drill and operate wells, to construct and operate gathering facilities, to pay off Canadian's funded debt in fixed amounts at fixed times, and to sell gas to others only as permitted by Colorado Interstate; and finally, to receive from Colorado Interstate as compensation for the rendering of all of these services (including the purchase price of the gas actually purchased) only Canadian's actual net cost incurred in connection therewith. Canadian's cost under the Contract is computed by deducting all outside revenue received by Canadian (including sales of gas to others) from the aggregate cost of producing and delivering all gas sold to purchasers. This cost includes interest and amortization of funded and other indebtedness of Canadian, but does not include depreciation and depletion. Canadian's Cost Contract and the bond indenture securing its $11,000,000 of 6% Sinking Fund Bonds, payable June 1, 1948, (Ex. 22, R. V. 2, 656-685) are interrelated documents, with the Cost Contract pledged as part of the security under the bond indenture. Sinking fund obligations are in excess of $600,000 annually which, together with interest, must be paid to prevent default.

[1] As to total revenue received see Commission finding (R., V. 1, 187), and as to total volume delivered (14.65-pound pressure base) see Flow Map, Commission Exhibit 138. (R., V. 2, 1079.) Also Commission Exhibit 226. (R., V. 4, 2319.)

son on the basis of the charges made for gas to Colorado Fuel & Iron Company.

V.

The Hope Case as a Precedent.

A careful consideration of both the Opinion of the Court and the concurring opinion of Mr. Justice Jackson demonstrates that the impact and end result rule announced in the *Hope* case has been erroneously applied to a jurisdictional question.

Petitioner desires to point out these specific illustrations:

(1) The Opinion of the Court assumes that the production and gathering jurisdictional question was advanced by the State of West Virginia in the *Hope* case and was there rejected by the Court. That portion of the *Hope* opinion which discusses the position of West Virginia does not urge this point as a jurisdictional matter but argues solely the reduced valuation of Hope's leaseholds and wells and the effect thereof on the welfare and economy of the State. The holding of this Court was that Congress did not entrust to the Commission various considerations which the State of West Virginia advanced. A brief reference only was made to the production and gathering provision of Section 1(b) of the Act in Note 25 on page 614 of the *Hope* opinion, which dealt only with the valuation of the production plant. The jurisdictional question was not urged by the Hope company, was not included in the application for rehearing before the Commission, and could not have been presented for decision to this Court.

(2) The opinion of the Court in this case further assumes that the Commission, if prevented from including production and gathering properties in the rate base, nevertheless might arrive at the same dollar result acting within its jurisdictional limitations. It is stated that the inquiry then would be whether "the end result was unjust and unreasonable." The *Hope* case is the authority for this view which attempts to impose the end result test to non-jurisdictional action. The same argument might be made if the Commission had reduced the prices charged for sales made in intrastate commerce. The Court attempts to justify

non-jurisdictional action on the theory that no confiscation has resulted and so no complaint can be made. It is Petitioner's contention that it is the duty of the Commission to investigate and find out what is the proper commodity value or field price of gas, and this proposal in no way places any minimum value or return on production properties, except such as may in fact be found to exist.

(3). Basing his concurrence on the *Hope* case, Mr. Justice Jackson states that he cannot fairly find that the Commission has exceeded its authority in obtaining the evidence which bears on matters beyond the Commission's regulatory jurisdiction. He disagrees emphatically with the use made of such evidence and the results obtained therefrom, but says that the *Hope* case has decided that point. It is the failure of the Commission to take evidence of all the economic factors stated by Mr. Justice Jackson and its exclusion of all but the rate base method that is the gravamen of Petitioner's complaint. The statute rejects the rate base method for production and gathering property just as does Mr. Justice Jackson, and the *Hope* case does not touch upon this particular point of pricing gas in the field.

In describing the Commission's method of determining a just and reasonable price for Petitioner's gas in this case, Mr. Justice Jackson, among other things, typifies the method used as being "fantastic" and "little better than to draw figures out of a hat." For this and other reasons, he would like to reverse the case; and yet in the end he reluctantly concurs in upholding the Commission's order for the stated reason that "The Court cannot, consistently with *Federal Power Commission v. Hope Natural Gas Co.*, 320 U. S. 591, do otherwise." He relates that the *Hope* case introduced into judicial review of administrative action a philosophy that the end justifies the means, to which philosophy he dissented then and still dissents. Notwithstanding such dissents, however, he concludes, "But, it is the law of this Court, and I do not understand that any majority is ready to reconsider it."

The ultimate decision of this Court in the *Hope* case was reached on a 5-to-3 vote, and the Chief Justice joined in the

opinion of the Court. In this case the Chief Justice has written what we construe to be a vigorous dissenting opinion. In this dissenting opinion, he has pointed out that there was no issue raised by the parties in the *Hope* case as to the jurisdiction of the Commission over producing and gathering properties, and that the end result principles applied in the *Hope* case are wholly inapplicable to the issue presented in this case, for reasons which he states most forcefully. It may be that a majority of the Court is not ready at this time to abandon entirely the end result philosophy promulgated through the *Hope* decision, but at least one member of the minimum majority which concurred in that decision has shown not only his willingness but his determination to impose appropriate restrictions and limitations upon the application of that philosophy and to deny the freedom of a blank check to administrative agencies by reason thereof, when presented the opportunity to do so in a proper case.

Even though it be conceded that the "end result" legal philosophy announced in the *Hope* case represents the law of the land until reversed by this Court, nevertheless, we assume that no such "end result" can be applied in any case unless it is arrived at by methods and procedures which conform to other well recognized principles of law also announced by this Court.

In the case of *Colorado-Wyoming Gas Co. v. Federal Power Commission, et al.*, also decided on April 2, 1945, Mr. Justice Douglas, speaking for a unanimous court, states as follows:

> "The review which Congress has provided for these rate orders is limited. Sec. 19(b) says that the 'finding of the Commission as to the facts, if supported by substantial evidence, shall be conclusive.' But we must first know what the 'finding' is before we can give it that conclusive weight. We have repeatedly emphasized the need for clarity and completeness in the basic or essential findings on which administrative orders rest. *Florida v. United States*, 282 U. S. 194, 215; *United States v. Baltimore & Ohio R. Co.*, 293 U. S. 454, 464; *United States v. Chicago, M. St. P. & P. R. Co.*, 294 U. S. 499, 504-505, 510-511; *United States v. Carolina Carriers Corp.*, 315 U. S. 475, 488-489. Their absence can only clog the administrative function and add to

the delays in rate-making. We cannot dispense with them for Congress has provided the standards for judicial review under this Act. Sec. 19(b). The courts cannot perform the function which Congress assigned to them in absence of adequate findings. Nor are they authorized under Section 19(b) to make findings and substitute them for those of the Commission."

Under the principles above stated, any Commission order to be tested under the "end result" theory must first pass the test of proper findings. Erroneous and improper findings would make the Commission's order just as defective as the absence of proper findings. Based upon the test year of 1939, the Commission does find or conclude in this case that the rates and charges of Petitioner subject to its jurisdiction are unjust, unreasonable and excessive to the extent of $561,000 per year. (See Commission's Findings, R., V. 1, 187) But the Commission arrives at this ultimate and critical finding or conclusion through preliminary findings and methods which Mr. Justice Jackson describes as being "fantastic," and which he says "vividly demonstrate the delirious results produced by the rate-base method" with respect to production and gathering properties. He further states that this case furnishes "another example of the capricious results of the rate-base method in this kind of case."

If, in order to be valid, an "end result" must be supported by proper findings, as it was held by this Court in the *Colorado-Wyoming Gas Company* case, then by what process of reasoning can the application of the "end result" theory in this case be upheld in any event when the ultimate finding or conclusion as to excessive rates is based upon findings, methods and results which are "fantastic," "delirious," "capricious," and "little better than to draw figures out of a hat"? Thus it would seem that a Justice might either agree or disagree with the "end result" legal philosophy of the *Hope* case and still find it wholly inapplicable or inappropriate here because of the lack of proper findings.

VI.

Where the Hope Case Leads for Petitioner

In reaffirming the views expressed by him in his dissenting opinion in the *Hope* case, Mr. Justice Jackson reiterates "that *Hope* provides no workable basis of judicial review, no key by which commissions can anticipate what rule, if any, will control our review, and no guidance to counsel as to what issues they should try or how they should try them." A more complete and devastating indictment of a rate regulatory concept would be difficult to frame. Notwithstanding his sweeping indictment and his sharp disagreement with the philosophy announced in the *Hope* case, however, he believes "that the majority which promulgated that decision, or a majority of that majority, should be permitted to spell out its application to specific problems *until we see where it leads.*" (Italics ours.) (p. 22)

This Court, or any individual member thereof, may find it desirable to bide time and to await the uncertain processes of trial and error in actual practice to appraise the results of the application of legal philosophies; both true and false; but most litigants, including this Petitioner, are not so fortunately situated. They must act today upon the judgment entered. They cannot delay until tomorrow on the premise that their own philosophies may be ultimately proven correct, and all will be well.

If the majority opinion in this case is to prevail, then it is a simple matter to spell out "where it leads" at once in so far as this Petitioner is concerned. Petitioner's properties, business and operations are covered entirely and exclusively by a Cost Contract with Colorado Interstate, wherein the cost of gas to Colorado Interstate is fixed as Petitioner's net actual cost after deducting revenues from all other sources. The Commission's order purports to change nothing in this Cost Contract, except its lifeblood, i.e., full reimbursement for costs incurred by Petitioner pursuant thereto. If Petitioner is to remain solvent then its income must at least equal its outgo. If Petitioner is to continue to drill wells and to produce, gather and transport natural gas, it must receive therefor sufficient funds to pay the cost thereof, as well as sufficient funds with which to meet installments of principal

and interest on its funded debt when due. If the Commission's rate reduction order is to stand, then Petitioner will receive less than its actual costs under the Cost Contract, and it must either seek some method of relieving itself from its obligations under the Cost Contract, or face bankruptcy or receivership forthwith.[4]

Petitioner fully appreciates the necessity for, and the value of, trial and error experimentation for the purpose of exploring the vast unknown in any process of evolution, but as to this particular proposed trial Petitioner agrees first with the four Justices who joined in the dissenting opinion that the trial should not be had because of lack of jurisdiction, and second, Petitioner agrees with the conviction so ardently expressed by Mr. Justice Jackson that the trial is foredoomed to failure and disaster in any event, because the ultimate error is even now so flagrantly apparent. Since a majority of the Court believes either that the trial is improper and should not be had or that it is foredoomed to failure in any event, then why the trial? At best, the life of a guinea pig is a precarious existence even in well-conceived and properly administered experimentation. Such a trial in this case can benefit no one, and certainly it can be only of slight consolation to Petitioner to have it subsequently recorded in future legal or scientific annals that the operation was a success but the patient died as an end result.

VII.

The Commission's Jurisdiction Over Production and Gathering

On the question of the Commission's jurisdiction over production or gathering of natural gas, Mr. Justice Jackson states that "If the Commission had imposed any direct regulation upon that activity, I would join in holding it to have exceeded its jurisdiction. But the orders in question have no immediate 'impact' upon production or gathering of gas." It would seem unnecessary here to split hairs over fine distinctions between direct and indirect, or immediate and ultimate. For the purpose of showing that what the Commission has done with respect to production and gather-

[4]See Petitioner's Brief on Petition for Certiorari, 19, 20, 40-42.

ing in this case is both immediate and ultimate, as well as direct and indirect, it should be sufficient to review the record briefly, as follows:

(a) The Commission has assumed full and complete rate regulatory jurisdiction over Petitioner's production and gathering properties, facilities and business in precisely the same manner as it has exercised such jurisdiction over Petitioner's transmission properties, facilities and business, notwithstanding Section 1(b) of the Act;

(b) The Commission has set up a total rate base of which approximately two-thirds represents production and gathering properties even at the Commission's "fantastic" conception of gas leasehold values, and in so doing it has denied Petitioner actual cost, discovery, market and every other recognized yardstick of actual value for its gas leaseholds, except provable capital expenses of Petitioner and predecessor companies, commencing with the first "wildcat" or discovery well drilled over 25 years ago; (R., V. 1, 144-195; V. 5, 2717-2721)

(c) The Commission has determined and included in its rate base an allowance for working capital which it deems sufficient to enable Petitioner to carry on its production and gathering operations; and likewise the Commission has purported to determine in its rate base for production and gathering properties what additional wells should be drilled and what additional gathering facilities should be installed in the future; (R., V. 5, 2530-2556)

(d) The Commission has allowed a rate of return of 6½% per annum upon such "fantastic" rate base, more than two-thirds of which, as above stated, is attributable to the hazardous business of discovering, exploring, developing and operating natural gas production properties; (R., V. 1, 187)

(e) The Commission has purported to determine the annual amount which should be allowed to Petitioner in the future for the purpose of defraying its cost of producing and gathering natural gas; (R., V. 5, 2530-2556)

(f) The Commission's order purports to change and abrogate the amount of compensation which Petitioner is

entitled to receive from Colorado Interstate under its Cost Contract, which compensation represents cost reimbursement to Petitioner, not only for the cost of current deliveries of gas to Colorado Interstate, but for the cost of performing various other services under the contract relating exclusively to Petitioner's production and gathering properties and operations, such as acquisition and maintenance of leaseholds, the drilling of wells, and the construction of gathering facilities; (R., V. 2, 711-780) and

(g) The Commission's order, if permitted to stand without relief of some character, would enforce default upon Petitioner not only in its Cost Contract obligations, but its funded debt obligations, notwithstanding the fact that Petitioner is operating as a non-profit company and has not had, and will not have, any earnings or profits for distribution to its owners so long as the Cost Contract remains in effect.

As Mr. Justice Jackson suggests, this case "vividly demonstrates the delirious results produced by the rate-base method," or at least the Commission's conception of such method. Again, as Mr. Justice Jackson suggests, the method is "little better than to draw figures out of a hat," but in this instance the hat seemed to be loaded with low figures. If Section 1(b) of the Act were entirely eliminated so as to leave no express statutory cloud or prohibition whatsoever upon the full and complete jurisdiction of the Commission over producing and gathering, it could not have done in this case any more than it did do.

The Opinion of the Court concedes that Section 1(b) of the Act "precludes the Commission from any control over the activity of producing or gathering natural gas. For example, it makes plain that the Commission has no control over the drilling and spacing of wells and the like." We assume this statement means that in the Opinion of the Court the Commission has no power to compel Petitioner to drill, or not to drill, gas wells. It is respectfully submitted that the Court is misled and that the Commission does and will continue to have such power just so long as this Court will sustain the power of the Commission (a) to include gas wells in a rate base at whatever valuation the Commission may determine, (b) to fix the amount of work-

ing capital which shall be allowed for the purpose of operating such wells, (c) to fix the rate of return which shall be applied against its valuation of such wells, and (d) to fix the amount of annual expense which shall be allowed for the purpose of operating such wells. The "impact" of the Commission's order upon Petitioner's producing and gathering properties, business and operations may not be "immediate," as stated by Mr. Justice Jackson, but at least it has the degree of immediacy suggested in the story of the man who fell out of the window on the thirtieth floor, and yelled that he was not hurt yet as he passed the thirteenth floor.

With respect to the Commission's rate regulatory jurisdiction over electric companies under the Federal Power Act, Mr. Justice Jackson has well said in his Opinion of the Court in the case of *The Connecticut Light & Power Co. v. Federal Power Commission*, decided March 26, 1945 (..... U. S. .....), that "whether the Act provides for such regulation depends upon whether the facilities are under the jurisdiction of the Commission; the Commission's jurisdiction does not depend on some independent application of the regulatory provisions." To reason otherwise, he states, would "get the cart before the horse." This Court appears to be of the unanimous view that Petitioner's production and gathering facilities are not subject to the jurisdiction of the Commission under the Act, and yet the independent application of the Commission's rate regulatory processes and provisions subjects them to the Commission's jurisdiction as completely and effectively as if the Section 1(b) of the Act conferred rather than denied such jurisdiction.

VIII.

Conclusion

The problems presented to Petitioner's management by the present judgment of this Court are not speculative or trivial. They are real and substantial. They gravely affect the immediate as well as the future existence of Petitioner's business. Primarily, Petitioner is engaged in the business of producing and gathering gas. From the standpoint of investment, revenues and expenses, it is only incidentally engaged in the business of transporting gas in interstate

commerce. In 1928, when Petitioner became a party to, and assumed its obligations for, the so-called Denver Project, it did so with the firm conviction that the Project should be protected and safeguarded against the vicissitudes of the future by the acquisition and maintenance of a gas reserve of sufficient size and dependability to cover all reasonable market requirements over a long period of years. This policy was believed to be in the best interests of the Project and the public which it served. If the Commission's order is to stand, this policy turns out to be an economic fallacy of serious magnitude to Petitioner.

As pointed out heretofore, the Opinion of the Court in this case concedes that Petitioner cannot be compelled by the Commission to drill wells and produce gas for pipeline purposes. Indeed, there is very little incentive so to do, when the same gas could be sold to others at the wellhead or in the field for approximately twice the price allowed therefor by the Commission. It would be far more profitable for Petitioner to dispose of its interstate transmission business, or to arrange to purchase gas from others for resale to Colorado Interstate. In the latter case, the full cost of such gas, if acquired at fair market values, would be allowed by the Commission as an operating expense to Petitioner, unless the Commission should change its past practices in this respect. It is true that the consuming public on the Denver Project might lose the benefits and advantages of a large and dependable source of gas which they have been enjoying over a period of years at very moderate prices, but Petitioner would be able at least to remain solvent.

Petitioner, the natural gas industry, and its consuming public are all faced with innumerable and inevitable economic uncertainties in the future, including reconversion after the war. Certainly they should be spared the uncertainty of waiting until it may be seen where the legal philosophy of the *Hope* case will lead, if a majority of the Court believes that the legal philosophy announced there is either erroneous or not applicable here. If the end result theory promulgated in the *Hope* case is wholly bad, as Mr. Justice Jackson has so graphically described, then surely something is gained in any event, so far as the

natural gas industry and its consuming public are concerned, if the area within which such theory may be applied is reduced and restricted, and this is true notwithstanding the fact that a majority of the Court may not be ready at this time to abandon such theory entirely.

In conclusion, may the Petitioner be permitted once more to state the paradoxical question: If, as appears on the face of the judgment record, *a majority of this Court* believes that the legal philosophy underlying the Opinion of the Court is either wholly wrong or wholly inapplicable here, then why the application of such philosophy to Petitioner's case? Why should the legal philosophy of *a minority of the Court* be inflicted upon Petitioner, the natural gas industry or the consuming public as a sacrifice upon the altar of juridical experimentation, or otherwise?

WHEREFORE, Petitioner prays that a rehearing be granted herein for the purpose of reconsidering the issues presented and the judgment entered herein, and that the time for the issuance of mandate of the Court herein be enlarged by order of this Court, and the issuance of such mandate be stayed until such time as this petition for rehearing has been finally disposed of by the Court.

BRIEF OF THE CITY AND COUNTY OF DENVER, SUGGESTING THAT THE COURT BELOW WAS WITHOUT JURISDICTION OVER THE SUBJECT MATTER.

MOTION OF THE CITY AND COUNTY OF DENVER TO DISMISS WRITS OF CERTIORARI AND FOR ORDER DIRECTING DISTRIBUTION OF MONIES.

To the Honorable Chief Justice and Associate Justices of the Supreme Court of the United States:

The City and County of Denver, respondent in the above entitled causes, by its counsel of record, moves the Court that the writs of certiorari herein be dismissed, and that the Tenth Circuit Court of Appeals be ordered to distribute the monies now on deposit and that hereafter shall be deposited under the terms of that certain stay order that was entered by said Court in said causes on May 16, 1942; and as grounds for said motion said respondent shows to the Court:

1. That the questions upon the merits which the petitioners herein seek to raise are not presented for review by the Supreme Court of the United States for the reason that the Tenth Circuit Court of Appeals for the Tenth Circuit was without jurisdiction over the subject matter of the petitions for review that appear in the record herein as more fully appears in the brief that is filed herewith.

2. That on May 16, 1942, in compliance with the prayer of a petition filed April 20, 1942, by petitioners in said Tenth Circuit Court of Appeals for an order staying the order of the Federal Power Commission in said causes, said Court entered a certain stay order in cause numbered 2550 in said Court, which is the same cause in which the writ of certiorari has been granted in the above entitled cause No. 279. (R.V.I. pp. 115-119).

That under and in accordance with the terms and conditions of said stay order there is now on deposit in the First National Bank of Denver, Colorado, between five and six millions of dollars that are subject to the "further order or orders" of said Tenth Circuit Court of Appeals as in said stay order provided, and the sums of money that are thereby required to be deposited are regularly being deposited in the amounts and at the times therein specified.

WHEREFORE, this respondent moves the Court that said writs of certiorari be dismissed; that said Tenth Circuit Court of Appeals be ordered to distribute said monies that have been and shall be deposited in said bank or elsewhere, in accordance with the terms and conditions of said order.

MALCOLM LINDSEY,
353 Municipal Building,
Denver 2, Colorado,

THOMAS H. GIBSON,

FEDERAL POWER COMMISSION, CITY AND COUNTY OF DENVER, COLORADO, PUBLIC SERVICE COMMISSION OF WYOMING, COLORADO-WYOMING GAS COMPANY, PUBLIC SERVICE COMPANY OF COLORADO, and COLORADO INTERSTATE GAS COMPANY, RESPONDENTS.

MOTION OF PUBLIC SERVICE COMPANY OF COLORADO FOR ORDER DIRECTING DISTRIBUTION OF MONIES.

To the Honorable Chief Justice and Associate Justices of the Supreme Court of the United States:

Comes now Public Service Company of Colorado, a corporation, Respondent in the above entitled causes, by its counsel, and respectfully moves the Court that the Tenth Circuit Court of Appeals be ordered to distribute the monies impounded and now on deposit under the order of said Circuit Court of May 16, 1942, to the ultimate gas consumers

served by this Respondent, and as grounds therefor said Respondent respectfully submits:

1. Respondent is a utility corporation organized and existing under and by virtue of the laws of the State of Colorado and is engaged, among other things, in the business of distributing natural gas at retail in several cities and towns in the State of Colorado, including the City of Denver, and rural territory in said state and through its subsidiary, The Pueblo Gas and Fuel Company, a corporation, serves the consumers in the City of Pueblo in said state, and said Company also through its subsidiary, Cheyenne Light, Fuel and Power Company, serves the consumers in the City of Cheyenne in the State of Wyoming.

2. That, on, to-wit, the 16th day of May, 1942, the said Circuit Court of Appeals, in compliance with the prayer of a petition filed April 20, 1942, for an order staying the order of the Federal Power Commission in said causes, said Court entered a certain stay order in said cause providing inter alia the amounts so deposited shall "* * * remain on deposit as provided in said order and in said escrow agreement, subject, however, to the further order or orders of this Court to be returned to such ultimate gas consumers or persons to whom the Court shall find the same should be returned as contemplated by the provisions of the Natural Gas Act" (R. V. I, P. 118).

3. That under the decisions and orders of the Federal Power Commission, the said Circuit Court of Appeals of the Tenth Circuit and this Court it has been found and determined that the funds so deposited in escrow, as aforesaid, represent income to the Colorado Interstate Gas Company in excess of the income to which it was lawfully entitled for the sale of natural gas to this Respondent and to other purchasers thereof.

4. That said impounded fund has not been paid or delivered to this Respondent at any time, and at no time has said fund constituted taxable income of this Respondent, and this Respondent has at no time asserted any right, title, interest, claim or demand to said fund.

5. That from and since the said 16th day of May, 1942

(the date of the entry of said order impounding said funds), this Respondent, the Respondent, the City and County of Denver, and the ultimate consumers of natural gas throughout the State of Colorado and in Cheyenne, Wyoming, have been and are now of the belief that said impounded funds are not the property of this Respondent but should be paid and delivered to said ultimate consumers.

6. That the ultimate gas consumers are of right entitled to the funds so deposited in escrow, as aforesaid, in equity and good conscience as monies had and received by the Colorado Interstate Gas Company, Respondent herein, for their benefit and are the equitable owners of a primary right thereto.

WHEREFORE, this Respondent moves the Court that said Tenth Circuit Court of Appeals be ordered to pay said monies to such person, persons or agency as this Court shall designate to the end that said funds shall be paid and delivered to the ultimate consumers of natural gas, and that the Court in making and entering such order find and determine that said impounded funds are not and have never been the property of this Respondent, and that said funds have never constituted taxable income of this Respondent, and that said Circuit Court be further ordered to continue to hold said impounded fund for a reasonable period of time within which any and all persons who may have any lawful claim, right, title or interest in and to said fund may appear therein and cause to be adjudicated their rights in the premises, and that upon the expiration of such reasonable time, to be fixed by said Circuit Court of Appeals, all claims of whatsoever kind or nature in and to said fund be forever barred.

COLORADO INTERSTATE GAS COMPANY, a Corporation, PETITIONER,

v.

FEDERAL POWER COMMISSION, CITY AND COUNTY OF DENVER, COLORADO, PUBLIC SERVICE COMMISSION OF WYOMING, COLORADO-WYOMING GAS COMPANY, PUBLIC SERVICE COMPANY OF COLORADO, and CANADIAN RIVER GAS COMPANY, RESPONDENTS.

PETITION FOR REHEARING AND FOR ENLARGEMENT OF TIME FOR ISSUANCE OF MANDATE AND STAY OF MANDATE.

Petitioner, Colorado Interstate Gas Company, files this petition for rehearing and enlargement of the time for issuance of mandate and stay of mandate for the sole reason hereinafter set forth.

Canadian River Gas Company in the companion case No. 380, October Term, 1944, is filing its petition for rehearing and enlargement of the time for stay of mandate.

A part of the reduction of $2,065,000 per annum ordered by the Commission against your petitioner was based upon a reduction ordered in Canadian's case in the price of gas sold by Canadian to petitioner in the amount of $551,000 per annum. If Canadian's petition for rehearing should be

granted and the order in Canadian's case ultimately enjoined, modified or set aside in whole or in part, then it would follow that the $2,065,000 reduction ordered in petitioner's case should be reduced accordingly.

In order to protect its right to the extent above stated petitioner prays that a rehearing herein be granted and that an order be entered enlarging the time for the issuance of mandate and for stay of mandate in the event the petition for rehearing and enlargement of the time for the issuance of mandate is granted in Canadian's case.

Respectfully submitted,

WM. A. DOUGHERTY,

CANADIAN RIVER GAS COMPANY, a Corporation, PETITIONER,

v.

FEDERAL POWER COMMISSION, CITY AND COUNTY OF DENVER, COLORADO, PUBLIC SERVICE COMMISSION OF WYOMING, COLORADO-WYOMING GAS COMPANY, PUBLIC SERVICE COMPANY OF COLORADO, and COLORADO INTERSTATE GAS COMPANY, RESPONDENTS.

BRIEF OF PETITIONERS IN ANSWER TO MOTION AND BRIEF OF CITY AND COUNTY OF DENVER SUGGESTING THAT THE COURT BELOW WAS WITHOUT JURISDICTION OVER THE SUBJECT MATTER.

Every proposition advanced by the City and County of Denver in its motion and brief recently filed has been de-

cided adversely to the City's contention since the oral argument in the above entitled cases.

Central States Electric Co. v. Muscatine, ... U. S. ....., 89 L. Ed. 540.

Panhandle Eastern Pipe Line Co. et al. v. Federal Power Commission et al., No. 296, October Term 1944, decided April 2, 1945.

It is clear from the motion filed by the City of Denver that a question of "jurisdiction" only is raised; that the City neither in this Court nor in the Circuit Court of Appeals has ever raised the question that the Tenth Circuit was not the proper court as a matter of "venue", if, in fact, that Court had jurisdiction, as distinguished from venue. As above stated, this question has been directly and positively decided against the City's contention in the Panhandle Eastern Case.

If, however, contrary to what appears to be the clear purport of the City's motion, it should be contended that a question of proper "venue" is presented, then we submit that in this case, as in the Panhandle Eastern Case, the right to raise that question has been waived by the City, as appears from the following.

In the Colorado Interstate case the petition for review shows:

Petitioner is a private corporation organized and existing under the laws of the State of Delaware. It owns and operates a main transmission natural gas pipeline extending from Clayton Junction, New Mexico, to a point just outside the city limits of the City and County of Denver, State of Colorado. Its General Manager and other representatives have their offices at Colorado Springs, Colorado. All of its physical properties are located, and all of its sales take place within territory comprising the Tenth Circuit (R. V. 1, p. 10).

Since incorporation, Colorado Interstate Gas Company and Canadian River Gas Company have jointly maintained an office in the Colorado Springs National Bank Building in Colorado Springs, Colorado, under the charge of a general manager, from where the supervision, di-

rection and management of the affairs of both of said companies have been conducted (R. V. 1, p. 125).

All of the gas purchased by Colorado Interstate Gas Company is purchased from Canadian River Gas Company, and all of said gas is delivered by said Canadian River Gas Company to Colorado Interstate Gas Company in territory included in the Tenth Circuit. (R., V. 1, p. 126).

All of the customers to whom Colorado Interstate Gas Company sells the gas so purchased by it from Canadian River Gas Company are located in the territory included in the Tenth Circuit, namely, either Colorado or Oklahoma, and all of said gas sold by Colorado Interstate Gas Company is delivered by it to the purchasers thereof, either in Colorado or Oklahoma.

All of the physical properties of Colorado Interstate Gas Company are located either in Colorado or New Mexico (R. V. 1, p. 126).

It was also shown that all of the contracts of Colorado Interstate Gas Company with its customers are made and acted upon at its Colorado Springs office and that all bills for gas sold by it are rendered out of the Colorado Springs office; that the purchasing agent for said company, as well as for Canadian River Gas Company, has his office in Colorado Springs; that all dealings between Canadian River Gas Company and Colorado Interstate Gas Company in connection with the purchase and sale of gas are handled in and through the Colorado Springs office; that all audits of gas sold and accounting are made at the Colorado Springs office; that moneys received for the sale of gas are deposited in Colorado Springs banks to the extent necessary to defray all operating expenses and taxes; and that the general books of account and property records are kept in Colorado Springs (R. V. 1, pp. 126-127).

Similar allegations are contained in the petition for review of Canadian River Gas Company (R. V. 1, pp. 42, 128-133).

None of these allegations have at any time been denied by the Federal Power Commission, or the City and County of Denver, or anyone else.

These admitted facts clearly show that the proper venue for this action was in the Tenth Circuit Court of Appeals, the Circuit is which the company "is located or has its principal place of business" (Section 19 (b), Natural Gas Act).

The City and County of Denver did, however, question the sufficiency of these allegations to give *jurisdiction* to the Tenth Circuit Court of Appeals in view of the further fact alleged in each of the petitions that the company was incorporated under the laws of the State of Delaware. This was by motion to dismiss first filed in the Circuit Court of Appeals on August 8, 1942 (R. V. 1, pp. 122-123).

Now let us see what had happened in the meantime. Under date of April 20, 1942, Colorado Interstate Gas Company and Canadian River Gas Company each filed a petition for a stay pending review of the rate order of the Federal Power Commission (R. V. 1, pp. 79-115). These petitions for a stay came on for hearing May 16, 1942, and in the stay order involving Colorado Interstate it is recited:

> "* * *. And it further appearing to the court that each of the respondents herein has been duly served with a copy of said petition filed herein, and of notice of hearing, * * *" (R. V. 1, p. 116).

And in the stay order involving Canadian River Gas Company it is recited:

> "* * *, the Respondent, Federal Power Commission, appearing by its attorney, Edw. H. Lange, the Respondent, City and County of Denver, Colorado, appearing by its attorneys, Thomas Gibson and Malcolm Lindsey, * * *" (R. V. 1, p. 120).

At this hearing City Attorney Lindsey and his assistant, Thomas H. Gibson, not only appeared representing the City and County of Denver as recited in the order aforesaid, but they participated in the discussions as to what form the stay order should take, and at the request of the Court the attorneys representing the petitioners, the attorney for the Federal Power Commission and Mr. Gibson, representing the City and County of Denver, conferred and agreed

upon the form of the order, and at the request of Mr. Gibson there was incorporated in the order a provision that the First National Bank of Denver, in addition to furnishing a certificate to the Clerk of the Court and the Federal Power Commission each month showing that the moneys required to be deposited had been deposited by Colorado Interstate Gas Company, should also furnish a copy to the City and County of Denver, Colorado (R. V. 1, p. 118).

The said order, in the case of Colorado Interstate Gas Company (R. V. 1, p. 117), showed the amount to be deposited each month by Colorado Interstate Gas Company in the First National Bank of Denver as follows:

May	$141,477.05
June	135,088.63
July	121,896.65

Each of these amounts was actually deposited by Colorado Interstate Gas Company with copy of the certificate by the First National Bank to the City and County of Denver showing such deposits, all prior to the filing of the motion to dismiss on August 8, 1942.

Thus, it is clear that the motion to dismiss, if construed as raising a question of venue, filed as it was on August 8, 1942, was not seasonably filed, and, accordingly, any such question of venue has been waived, as held by this Court in the Panhandle Eastern Pipe Line Case, supra. Furthermore, if a question of venue is thought to be presented, we submit that the City and County of Denver alone, being only one of several parties respondent, should not be permitted to control this question of venue even if it had not waived it.

Finally, even on a "venue" approach it is obvious from the facts shown in the record that the Tenth Circuit Court of Appeals was a proper court to decide the review in this case. There are no facts presented by motion or otherwise which would indicate that for "venue" reasons, either from the standpoint of the City and County of Denver or any other party to the proceeding, the Tenth Circuit was not the proper court.

As to the ultimate distribution of impounded funds, ex-

cept to the extent indicated in petitioner's petition for rehearing and enlargement of the time for issuance of mandate filed contemporaneously herewith, petitioner is not interested so long as it is fully protected by any order which may be entered relating to that subject.

Respectfully submitted,

SUPREME COURT OF THE UNITED STATES.

Nos. 379 and 380.—October Term, 1944.

Colorado Interstate Gas Company, Petitioner, vs. Federal Power Commission, City and County of Denver, Colorado, Public Service Commission of Wyoming, et al. (379)	On Writs of Certiorari to the United States Circuit Court of Appeals for the Tenth Circuit.
Canadian River Gas Company, vs. Federal Power Commission, City and County of Denver, Colorado, Public Service Commission of Wyoming, et al. (380)	

[April 2, 1945.]

Mr. Justice Douglas delivered the opinion of the Court.

The Federal Power Commission after an investigation and hearing entered orders under § 5 of the Natural Gas Act of 1938 (52 Stat. 823, 15 U. S. C. § 717d) finding the interstate wholesale rates of petitioners to be excessive by specified amounts per year and requiring petitioners to reduce the rates accordingly. 43 P. U. R. (N. S.) 205. The Circuit Court of Appeals for the Tenth Circuit affirmed the Commission's orders. 142 F. 2d 943. The cases are here on petitions for certiorari which we granted, limited to the few questions to which we will presently advert.

Petitioners (to whom we will refer as Canadian and as Colorado Interstate) had their origin in an agreement made in 1927 between Southwestern Development Co. (Southwestern), Standard Oil Co. (N. J.) (Standard) and Cities Service Co. (Cities Service). It was the purpose of the agreement to bring natural gas from the Panhandle field in Texas to the Colorado markets, including Denver and Pueblo. Southwestern agreed to transfer through a wholly owned subsidiary, Amarillo Oil Co. (Amarillo), certain gas leaseholds and producing properties to a new subsidiary (Canadian) which it would organize for that purpose. Standard agreed to form a new corporation (Colorado Interstate) and to finance its construction of pipeline facilities which

would connect with Canadian's facilities and transport gas from those points in the Panhandle field to the Colorado markets. Cities Service agreed to use its best efforts to obtain franchises through its subsidiaries under which the natural gas could be distributed in certain cities in Colorado including Denver and Pueblo. The gas was to be sold to Colorado Interstate by Canadian at cost (as defined in the contract) for at least 20 years from 1928. We will return to other details of this tripartite agreement and of the organization and financing of Canadian and Colorado Interstate. It is sufficient here to say that the companies were incorporated, the pipeline was built, and the business put into operation. Although Canadian and Colorado Interstate are separate companies, the Commission found that their properties have been operated as a single enterprise.

Canadian produces from its own properties all the gas which it sells. It has about 300,000 acres of natural gas leaseholds and on December 31, 1939, was operating 94 wells. Its gathering system consists of approximately 144 miles of pipe. It owns and operates a transmission line which connects with its gathering system in the Panhandle field and ends about 85 miles distant at a point near Clayton, New Mexico. Canadian sells some of its gas at the wellhead and along the Texas portion of its transmission line for consumption in Texas. It also sells gas for resale in Clayton, New Mexico. But the chief portion of the gas in its transmission line is sold at that point to Colorado Interstate. The pipeline of Colorado Interstate extends to Denver. It sells the gas to various distributing companies for resale by them in Colorado and in a few points in Wyoming.[1] Colorado Interstate also sells gas from this pipeline direct to industrial customers in Colorado for their own use.

It is thus apparent that the pipeline from Texas to Colorado serves three different uses: (a) intrastate transportation and sale in Texas; (b) interstate transportation and sale to industrial customers; and (c) interstate transportation to distributing companies for resale. Only some of those activities are subject to the jurisdiction of the Commission. For § 1(b) of the Act provides:

[1] The latter resales are made by Colorado-Wyoming Gas Co. which transports the gas from a point near Littleton, Colorado to Cheyenne, Wyoming. The proceedings against this company were consolidated with those against Canadian and Colorado Interstate. The Commission also ordered a reduction in the rates charged by Colorado-Wyoming Gas Co. That order is here for review on certain points in No. 575, decided today.

"The provisions of this chapter shall apply to the transportation of natural gas in interstate commerce, to the sale in interstate commerce of natural gas for resale for ultimate public consumption for domestic, commercial, industrial, or any other use, and to natural-gas companies engaged in such transportation or sale, but shall not apply to any other transportation or sale of natural gas or to the local distribution of natural gas or to the facilities used for such distribution or to the production or gathering of natural gas."

It is around the meaning and implications of that provision that most of the present controversy turns.

Allocation of Cost of Service. The questions raised by Colorado Interstate and some of those raised by Canadian relate to the failure of the Commission (1) to separate the physical property used in common in the intrastate and interstate business; (2) to separate that used in common in the sales of gas to industrial consumers and the sales of gas for resale; and (3) to separate the property used exclusively in intrastate business or exclusively for industrial sales. The Commission thought it unnecessary to make such a separation of the properties. It noted that nowhere in the evidence presented by petitioners was there "a complete presentation of the entire operations of the company broken down between jurisdictional and nonjurisdictional operations." 43 P. U. R. (N. S.), p. 232. And it concluded, "All that can be accomplished by an allocation of physical properties can be attained by allocating costs including the return. The latter method is by far the most practical and businesslike." *Id.*, p. 232. The Commission adopted the so-called "demand and commodity" method for allocating costs. Cf. *Arkansas Louisiana Gas Co.* v. *Texarkana*, 96 F. 2d 179, 185. It took the costs and divided them into three classes—volumetric, capacity, distribution.[2] Costs relating to the production system were treated as volumetric.[3] These included rate of return and depreciation and depletion on leases and wells. These volumetric costs were allocated to the customers in proportion to the number of Mcf's delivered to each customer in 1939. The larger share of the transmission costs of the Denver pipeline were classified as capacity costs. Supplies and expenses of compressing systems, maintenance of compressing system equipment and accruals

[2] The Commission in its report characterized volumetric costs as variable costs and capacity costs as fixed costs. 43 P. U. R. (N. S.) p. 232.

[3] A residual refining credit was determined and deducted from production costs.

for its depreciation were classed as volumetric. And one-half of the return and income taxes on the Denver pipeline and one-half of operating labor on the compressing system were classed as volumetric, the other half being classed as capacity. Capacity costs were allocated to the customers in the ratio that the net sales to each customer on the system peak day of February 9, 1939, bore to the total sales to all customers on that day. Distribution costs were composed in part of depreciation, taxes, and return on investment in metering and regulating equipment through which gas is delivered at individual stations to each customer. These were allocated to each customer in the ratio which the investment for each customer bore to the total investment in such facilities which were available to serve all customers. Distribution costs also included operating and maintenance expenses incurred in operating the metering and regulating stations. These were allocated on the basis of the number of stations.

The function which an allocation of costs (including return) is designed to perform in a rate case of this character is clear. The amount of gross revenue from each class of business is known. Some of those revenues are derived from sales at rates which the Commission has no power to fix. The other part of the gross revenues comes from the interstate wholesale rates which are under the Commission's jurisdiction. The problem is to allocate to each class of the business its fair share of the costs. It is of course immaterial that the revenues from the intrastate sales or the direct industrial sales may exceed their costs, since the authority to regulate those phases of the business is lacking. To the extent, however, that the revenues from the interstate wholesale business exceed the costs allocable to that phase of the business, the interstate wholesale rates are excessive. The use of that method in these cases produced the following results:

Canadian

	Revenues	*Costs*	*Excess Revenue Over Costs*
Regulated	$2,151,000	$1,590,000	$561,000
Unregulated	242,000	188,000	54,000

Colorado Interstate

	Revenues	*Costs*	*Excess Revenue Over Costs*
Regulated	$4,438,000	$2,373,000	$2,065,000
Unregulated	1,335,000	1,204,000	131,000

The Commission did not include in the rate reductions which it ordered any of the excess revenues over costs from the unregulated business. The reductions ordered were measured solely by the excess revenues over costs in the regulated business, viz., $2,065,000 in case of Colorado Interstate and $561,000 in case of Canadian.

Colorado Interstate and Canadian make several objections to that method. They maintain in the first place that a segregation of the physical property based upon use is necessary so that the payment due for the use of that property which is in the public service may be determined. Reliance for that position is rested on the *Minnesota Rate Cases*, 230 U. S. 352, 435, and *Smith* v. *Illinois Bell Telephone Co.*, 282 U. S. 133, 146. Those were cases which involved state regulation of intrastate rates of companies doing both an intrastate and interstate business. But the rule fashioned by this Court for use in those situations was not written into the Natural Gas Act. Congress indeed prescribed no formula for determining how the interstate wholesale business, whose rates are regulated, should be segregated from the other phases of the business whose rates are not regulated. Rate-making is essentially a legislative function. *Munn* v. *Illinois*, 94 U. S. 113. Congress to be sure has provided for judicial review of the Commission's orders. § 19. But that review is limited to keeping the Commission within the bounds which Congress has created. When Congress, as here, fails to provide a formula for the Commission to follow courts are not warranted in rejecting the one which the Commission employs unless it plainly contravenes the statutory scheme of regulation. If Congress had prescribed a formula it would be the duty of the Commission to follow it. But we cannot say that under the Natural Gas Act the Commission can employ only one allocation formula and that that formula must entail a segregation of property. A separation of properties is merely a step in the determination of costs properly allocable to the various classes of services rendered by a utility. But where as here several classes of services have a common use of the same property difficulties of separation are obvious. Allocation of costs is not a matter for the slide-rule. It involves judgment on a myriad of facts. It has no claim to an exact science. Hamilton, Cost as a Standard for Price, 4 Law & Cont. Prob. 321. But neither does the separation of properties which are not in fact separable because they function as an integrated whole. Mr. Justice Brandeis, speaking for the Court in *Groesbeck*

v. *Duluth, S. S. & A. Ry. Co.*, 250 U. S. 607, 614-615, noted that "it is much easier to reject formulas presented as being misleading than to find one apparently adequate." Under this Act the appropriateness of the formula employed by the Commission in a given case raises questions of fact not of law.

Colorado Interstate claims that the Commission's formula ignored or at least failed to give full effect to the priority which the wholesale gas has over direct industrial sales—a priority recognized in the contracts with industrial users and in the municipal franchises. But over the years the interruptions or curtailments in service to direct industrial customers appear to have been slight.[4] Moreover, to the extent that the priority accorded wholesale gas was actually exercised during the test year (1939) the allocation of costs made by the Commission gave full effect to it. As we have seen, volumetric costs were allocated to the customers in proportion to the number of Mcfs delivered to each customer during the year; capacity costs were allocated in the ratio that the Mcf sales to each customer on the system peak day bore to the total sales on that day. The formula used reflected all actual curtailments of load to each customer during the year and on the system peak day.

Colorado Interstate objects because the Commission treated the transmission line as a unit. It points out that some laterals and equipment (such as metering stations) are used exclusively for making wholesale sales, some are used exclusively for making intrastate sales for direct industrial sales, and some are used in common in varying degrees by the several classes of business. It is pointed out, for example, that the line north of Pueblo is used almost exclusively by the regulated business but that under the Commission's formula the pipeline was treated as if all the gas went into the pipe in Texas and came out at the Denver city gate. These objections are partially met by the manner in which distribution costs, to which we have referred, were allocated. But that is no more than a partial answer since they pertained only to metering and regulating equipment. The laterals were not segregated. They, however, appear to be used more commonly for direct industrial rather than for wholesale sales; and we are not convinced that the direct industrial sales were saddled with greater costs than they would have been had the laterals been segregated. The gravamen of this complaint is that the industrial sales are being burdened with costs of a part of the system

[4] Fifteen times in some 12 years.

which the direct industrial gas never uses. That contention points up our earlier observation that judgment and discretion control both the separation of property and the allocation of costs when it is sought to reduce to its component parts a business which functions as an integrated whole. The Commission found that but for the direct industrial market at Pueblo, Colorado and the wholesale market at Denver, the pipeline would not have been constructed. 43 P. U. R. (N. S.) p. 210. It is therefore obviously fair to determine transmission costs for the pipeline as a whole and not to compute them on a mileage demand basis. In that way the beneficiaries of the entire project share equitably in the cost. To allow the costs to accumulate the closer the gas gets to Denver would be to assume that the extension to Denver was a separate project on which the earlier customers were in no way dependent. These circumstances illustrate that considerations of fairness, not mere mathematics, govern the allocation of costs. Cf. *Wabash Valley Electric Co.* v. *Young*, 287 U. S. 488, 499. What we have said also answers Canadian's complaint that the wholesale sales in Texas for consumption in the towns of Dalhart, Hartley, and Texline, Texas, are burdened with too large a share of transmission costs. We can see in this situation no difference between those customers and the ones located at more distant points on the pipeline.[5]

Colorado Interstate objects to that part of the Commission's treatment of transmission costs whereby it assigned 50% of the return to capacity costs and 50% to volumetric costs. The contention is that the entire return on the transmission facilities should be apportioned to capacity costs on the theory that the volumetric costs have no relation to the property required for meeting the maximum demands of the wholesale business and that the method employed departs from the requirements of a fair return on the property devoted to the public service. But as we have seen capacity costs were allocated to customers in the ratio that the Mcf sales to each customer on the system peak day bore to the total sales to all customers on that day. It is not apparent why direct industrial sales should carry a lighter share of the costs merely because their use of the pipeline may be less on the system peak day. As the Commission points out, if the method advanced by Colorado Interstate were used, the amount paid by the industrial customer for transportation of

[5] So far as appears Canadian presented no evidence showing the cost of these intrastate sales.

the gas through the pipeline would be measured not by the customer's use throughout the year, which might be substantial, but by its use on the system peak day which might be slight. In that event the industrial customer would obtain to an extent free transportation of gas.

Colorado Interstate also makes objection to the selection and use of February 9, 1939, as the system peak day and the allocation of the capacity cost component of the transmission costs on the basis of use on that day. It is argued that the mean temperature for that day was 8° Fahrenheit above zero, that much lower mean temperatures are experienced in the Colorado area, that as the temperature drops the load of resale gas rapidly increases, and that if these capacity costs were allocated on the basis of use during the coldest day the resale gas would carry a greater portion of them. We do not stop to develop the point. We have carefully considered Colorado Interstate's contention. As we read the record, if either of the days selected by Colorado Interstate were taken as the system peak days, there would be allocated to the industrial gas a larger portion of these capacity costs than the Commission allocated. On that showing we cannot say that the choice of February 9, 1939, was unfair.

Colorado Interstate and Canadian object to the Commission's use of the return. The Commission included in the total cost of service for these companies a 6½ per cent return on the rate base.[6] In other words, the 6½ per cent return was computed on the basis of all the property used by petitioners in their various classes of business—intrastate sales, direct industrial sales, and interstate wholesale sales.[7] Now it is apparent that if the reduction ordered was based on the excess of revenues from all classes of business over the aggregate costs, the result would be to reduce to a common level the profits from each class. In that case, whenever a company was making a higher return on its unregulated business than the rate of return allowed for the regulated business, the excess earnings from the unregulated part would be appropriated to the entire business. When the unregulated business was being operated at a loss or at less than

[6] As we have said, the return on leases and wells was treated as volumetric costs; 50 per cent of the return on the Denver pipeline was treated as volumetric and 50 per cent as capacity costs; and return on investment in metering and regulating equipment was treated as distribution costs.

[7] As respects the accounting for the cost of money invested in the enterprise see Schlatter, Advanced Cost Accounting (1939), ch. XII; Neuner, Cost Accounting (1942), p. 277; Lawrence, Cost Accounting (1930), ch. 22.

the return which was allowed, excess earnings from the regulated business would be appropriated to the unregulated business. A low rate might therefore be concealed by siphoning earnings from the unregulated business; a high rate might be built up by making the regulated business share the losses of the unregulated one.

It is said that that is what happened here. But that is not true. As we have seen, the Commission ordered a rate reduction based solely on the excess of revenues over costs (including return) derived from the regulated business. None of the excess revenues over costs (including return) from the unregulated business was included in that reduction. If the Commission in determining costs of the unregulated business had used a higher rate of return, it would have increased the costs of that business and reduced the excess revenues allocable to it. But since under the Commission's method of allocation the amount of that excess would not be reflected in the reduction ordered, there would be no difference in result.

The cases are presented as if the 6½ per cent allowed by the Commission on the rate base limits the earnings from the whole enterprise to 6½ per cent. That also is not true. The return merely measures the earnings allowed from the regulated business. As we have noted, the excess of earnings which Colorado Interstate makes from direct industrial sales (on the basis of 6½ per cent return) is $131,000 annually. The Commission pointed out (43 P. U. R. (N. S.) p. 230) that if Colorado Interstate "retains these earnings in excess of a 6½ per cent rate of return on its sales to these customers, its rate of return on its entire business is increased to approximately 8 per cent *after placing into effect the reductions in rates ordered herein*."

Of the other objections made by Canadian and Colorado Interstate on this phase of the case, we need mention only one.[8] It is contended that the findings of the Commission on the allocation of costs are inadequate and that the cases should be remanded to the Commission so that appropriate findings may be made. The findings of the Commission in this regard leave much to be

[8] It is objected that the allocation made by the Commission results in discrimination between purchasers of gas from Colorado Interstate as indicated by the fact that costs allocated to one customer who is distant from Denver are greater than costs allocated to another customer at Denver. But all the Commission did was to order an aggregate reduction in the wholesale rates of $2,065,000 so as to produce a fair return. The adjustment of the rate schedules for various delivery points has not yet been made. See Federal Power Commission v. Natural Gas Pipeline Co., 315 U. S. 575, 584.

desired since they are quite summary and incorporate by reference the Commission's staff's exhibits on allocation of cost. But the path which it followed can be discerned. And we do not believe its findings are so vague and obscure as to make the judicial review contemplated by the Act a perfunctory process. Cf. *United States* v. *Chicago, M. St. P. & P. R. Co.*, 294 U. S. 499; *United States* v. *Carolina Freight Carriers Corp.*, 315 U. S. 475.

Canadian's Sales to Colorado Interstate. The Commission ordered a blanket reduction of $561,000 in the sales price of all types of gas sold by Canadian to Colorado Interstate. A substantial part of that gas is sold to Colorado Interstate for resale to direct industrial customers. Canadian maintains that the Commission has no authority to fix the rate on the sale of that portion or class of gas to Colorado Interstate. Sec. 1(b) of the Act, however, provides, as we have noted, that the provisions of the Act apply "to the sale in interstate commerce of natural gas for resale for ultimate public consumption for domestic, commercial, industrial, or any other use". Canadian however seeks support for its position in the declaration in § 1(a) of the Act that "the business of transporting and selling natural gas for ultimate distribution to the public is affected with a public interest." But we find no warrant for saying that the words "ultimate distribution to the public" imply distribution to domestic users alone. Industrial users are as much a part of the "public" as domestic users and other commercial users. And the distribution to one is as "ultimate" as the distribution to the other. Moreover, that declaration of policy may not be used to take out of § 1(b) of the Act the express provision subjecting to regulation gas sold for resale for "industrial use". Furthermore, the declaration of policy contained in § 1(a) is not as narrow as Canadian suggests. For § 1(a) goes on to say that federal regulation in matters relating to "the transportation of natural gas and the sale thereof in interstate and foreign commerce is necessary in the public interest." Sales for resale to industrial users is embraced in the broad sweep of that language. Canadian also seeks support for its position from the proviso in § 4(e) of the Act that the Commission shall not have authority to suspend the rate "for the sale of natural gas for resale for industrial use only". Canadian infers from that provision that such rates are not subject to regulation by the Commission. The short answer, however, is that the authority of the Commission to suspend rates is restricted to rates

over which it has jurisdiction. If the Commission had no authority over the rates in question, the proviso in § 4(e) would be unnecessary. Accordingly, it seems clear that all of the gas sold by Canadian to Colorado Interstate for resale, including that sold for resale for industrial use, is subject to rate regulation by the Commission.

There is the further suggestion in Canadian's argument that since the Commission treated Canadian and Colorado Interstate as an integrated system for purposes of allocation of costs, it should have limited its rate reduction to those rates over which it would have jurisdiction if the two companies were in fact one. It is argued that in such event there would be no sales between Canadian and Colorado Interstate and the latter's direct sales to industrial users would not be subject to the jurisdiction of the Commission. The difficulty is that Colorado Interstate purchases its gas from Canadian and the purchase price is the interstate wholesale rate which is an operating expense on which Colorado Interstate's resale rates are computed. Moreover, Canadian as required by § 4(c) of the Act has its rate to Colorado Interstate in a rate schedule on file with the Commission. Unless and until a new rate schedule was filed or the old schedule changed by the Commission, that rate would have to be exacted by Canadian and paid by Colorado Interstate. § 4(d). That rate therefore could hardly be maintained if Colorado Interstate were allowed as an operating expense a lesser amount for the gas it purchases from Canadian.

Producing and gathering facilities. Sec. 1(b) which we have already quoted states that the provisions of the Act "shall not apply . . . to the production or gathering of natural gas." The Commission determined a rate base which includes Canadian's production and gathering properties as well as its interstate transmission system. The return allowed by the Commission was limited to 6½ per cent of the rate base so computed. The Commission made an allowance for working capital to enable Canadian to carry on its production and gathering operations. The Commission made an allowance for Canadian's operating expenses which included the cost of producing and gathering natural gas. The Commission applied its formula for allocation of costs to Canadian's production and gathering properties as well as to its other facilities. Thus Canadian contends that contrary to the mandate of § 1(b) the Commission has undertaken to regulate

the production and gathering of natural gas. Reliance for that position is sought from other provisions of the Act. It is pointed out that § 1(a) declares that "the business of transporting and selling natural gas" for ultimate distribution to the public is affected with a public interest and that federal regulation "in matters relating to the transportation of natural gas and the sale thereof" in interstate commerce is necessary in the public interest. Transportation and sale do not include production or gathering. Other sections emphasize that distinction. Thus § 4 and § 5, the rate regulating provisions of the Act, refer to charges for the "transportation or sale of natural gas, subject to the jurisdiction of the Commission." Sec. 7(a) relates to the extension or improvement of "transportation facilities"; § 7(b) to the abandonment of "facilities subject to the jurisdiction of the Commission"; § 7(c) to the construction or extension of facilities for the "transportation or sale of natural gas, subject to the jurisdiction of the Commission." It is pointed out that apart from § 1(b) only a few sections of the Act refer to "production". Sec. 5(b) gives the Commission power to investigate "the cost of the production or transportation of natural gas by a natural-gas company in cases where the Commission has no authority to establish a rate governing the transportation or sale of such natural gas." This goes no further, it is said, than to aid state regulation. Sec. 9(a) authorizes the Commission to ascertain and determine and by order fix "the proper and adequate rates of depreciation and amortization of the several classes of property of each natural-gas company used or useful in the production, transportation, or sale of natural gas." Sec. 9(a) further provides that no natural-gas company subject to the jurisdiction of the Commission shall charge to operating expenses "any depreciation or amortization charges on classes of property other than those prescribed by the Commission, or charge with respect to any class of property a percentage of depreciation or amortization other than that prescribed therefor by the Commission." These are said, however, to be no more than accounting requirements and distinct from the fixing of rates to be charged for public utility or transportation services. That distinction is emphasized, it is said, by the proviso in § 9(a) that "Nothing in this section shall limit the power of a State Commission to determine in the exercise of its jurisdiction, with respect to any natural-gas company, the percentage rates of depreciation or amortization to be allowed, as to any class of prop-

erty of such natural-gas company, or the composite depreciation or amortization rate, for the purpose of determining rates or charges." The provisions of § 10(a) which give the Commission authority to require reports from natural-gas companies as to their assets and liabilities, the "cost of maintenance and operation of facilities for the production" of natural gas and the like are said to be mere information requirements, quite consistent with the absence of power to regulate the production and gathering of natural gas.[9] See *Interstate Commerce Commission* v. *Goodrich Transit Co.*, 224 U. S. 194. And the authority given the Commission by § 14(b) is said merely to supplement the Commission's powers under sections of the Act. Sec. 14(b) grants the Commission power to determine "the adequacy or inadequacy of the gas reserves held or controlled by any natural-gas company" and "the propriety and reasonableness of the inclusion in operating expenses, capital, or surplus of all delay rentals or other forms of rental or compensation for unoperated lands and leases." This is said to supplement the Commission's authority over the construction, extension, or abandonment of facilities or service under § 7, the determination of amortization rates under § 9(a), and the accounting requirements of § 8.

Support for Canadian's position is also sought in the legislative history of the Act. It is pointed out that the declared purpose of the legislation was to occupy the field in which this Court had held the States might not act. *See Federal Power Commission* v. *Hope Natural Gas Co.*, 320 U. S. 591, 609-610. And it is noted that Senator Wheeler, who sponsored the legislation in the Senate, said during the debate in answer to an inquiry whether the bill undertook to regulate the production of natural gas or the producers of natural gas. "It does not attempt to regulate the producers of natural gas or the distributors of natural gas; only those who sell it wholesale in interstate commerce." 81 Cong. Rec. p. 9312.

From these various materials it is argued that the Commission has no authority to include producing or gathering facilities in a rate base or to include production or gathering expenses in operating expenses. It is said that when the Commission follows that course, it regulates the production and gathering of natural

[9] Another section of the Act which refers to "production" is § 11(a). It gives the Commission certain functions to perform where two or more States propose compacts dealing with the conservation, production, transportation, or distribution of natural gas.

gas contrary to the provisions of § 1(b) of the Act. It is argued that the correct procedure is for the Commission to allow in the operating expenses of a natural-gas company, whose rates it is empowered to fix, the "fair field price" or "fair market value, as a commodity, of the gas" which finds its way into the transmission lines for interstate transportation and sale.

This is precisely the argument which West Virginia, appearing as *amicus curiae*, advanced in the *Hope Natural Gas Co.* case. We rejected the argument in that case. 320 U. S. pp. 607-615, particularly p. 614, n. 25. We have reviewed it here at this length in view of the seriousness with which it has been urged not only by Canadian but also by the Independent Natural Gas Association of America which appeared *amicus curiae*. But we adhere to our decision in the *Hope Natural Gas Co.* case and will briefly state our reasons.

A natural-gas company as defined in § 2(6) of the Act is "a person engaged in the transportation of natural gas in interstate commerce, or the sale in interstate commerce of such gas for resale." Canadian is such a company. It is plain therefore that the Commission has authority to fix its interstate wholesale rates. § 5. It is obvious that when rates of a utility are fixed the value of its property is affected. For as we stated in the *Hope Natural Gas Co.* case, value is "the end product of the process of rate-making not the starting point." 320 U. S. p. 601. When a natural-gas company which owns producing properties or a gathering system is restricted in its earnings by a rate order, the value of all of its property is affected. Congress of course might have provided that producing or gathering facilities be excluded from the rate base and that an allowance be made in operating expenses for the fair field price of the gas as a commodity. Some have thought that to be the wiser course. But we search the Act in vain for any such mandate. The Committee Report stated that the Act provided "for regulation along recognized and more or less standardized lines" and that there was "nothing novel in its provisions". H. Rep. No. 709, 75th Cong., 1st Sess., p. 3. Certainly the use of a rate base which reflects the property of the utility whose rates are being fixed has been customary. 2 Bonbright, Valuation of Property (1937) ch. XXX; Smith, The Control of Power Rates in the United States and England (1932); 159 The Annals 101. Prior to the Act that method was employed in the fixing of the rates of gas, as well as electric, utilities. See *Wilcox* v. *Consolidated Gas Co.*, 212 U. S. 19; *Cedar Rapids Gas*

Co. v. *Cedar Rapids*, 223 U. S. 655; *Newark Natural Gas & F. Co.* v. *Newark*, 242 U. S. 405; *Railroad Commission* v. *Pacific Gas & Electric Co.*, 302 U. S. 388; *Lone Star Gas Co.* v. *Texas*, 304 U. S. 224. We do not say that the Commission lacks the authority to depart from the rate-base method. We only hold that the Commission is not precluded from using it. There are ample indications throughout the Act to support that view. Sec. 6(a) empowers the Commission to investigate and ascertain the "actual legitimate cost of the property of every natural-gas company, the depreciation therein, and, when found necessary for rate-making purposes, other facts which bear on the determination of such cost or depreciation and the fair value of such property." As we have noted, § 9(a) gives the Commission authority not only to require natural gas companies to carry proper and adequate depreciation and amortization accounts but also to fix such rates for "the several classes of property of each natural-gas company used or useful in the production, transportation, or sale of natural gas". And § 14(b), as already stated, not only gives the Commission authority to determine the adequacy or inadequacy of gas reserves of a natural-gas company but also empowers it to determine the "propriety and reasonableness of the inclusion in operating expenses, capital, or surplus of all delay rentals or other forms of rental or compensation for unoperated lands and leases." Sec. 9(a) and § 14(b), though designed not to limit the power of state regulatory agencies, plainly were designed to aid the Commission in its rate-making functions. These provisions[10] all suggest that when Congress designed this Act it was thinking in terms of the ingredients of a rate base, the deductions which might be made, and the additions which were contemplated. No exclusion of property used or useful in *production* of natural gas was made. That type of property was not singled out for special treatment; it was treated the same as all other property. We must read § 1(b) in the context of the whole Act. It must be reconciled with the explicit provisions which describe the normal conventions of rate-making.

That does not mean that the part of § 1(b) which provides that the Act shall not apply "to the production or gathering of natural gas" is given no meaning. Certainly that provision precludes the Commission from any control over the activity of producing or gathering natural gas. For example, it makes plain that

[10] Secs. 5(b), 6(a), 9(a), 10(a), and 14(b).

the Commission has no control over the drilling and spacing of wells and the like. It may put other limitations on the Commission. We only decide that it does not preclude the Commission from reflecting the production and gathering facilities of a natural gas company in the rate base and determining the expenses incident thereto for the purposes of determining the reasonableness of rates subject to its jurisdiction.

That treatment of producing properties and gathering facilities has of course an indirect effect on them. As we have said, rate-making like other forms of price fixing may reduce the value of the property which is being regulated. *Federal Power Commission* v. *Hope Natural Gas Co., supra,* p. 601. But that would be true whether or not a rate-base was used. Canadian would be the first to object if the gas which it owns was given no valuation in these proceedings. Obviously it has value. The Act does not say that the Commission would have to value it at the fair field price if the Commission abandoned the rate-base method of regulation. We held in the *Hope Natural Gas Co.* case that under the Act it is "the result reached not the method employed which is controlling. . . . It is not theory but the impact of the rate order which counts. If the total effect of the rate order cannot be said to be unjust and unreasonable, judicial inquiry under the Act is at an end." 320 U. S. p. 602. If the Commission followed Canadian's method, excluded the producing properties and gathering facilities from the rate-base, valued the gas at a price which would reduce the earnings to the level of the present order, the effect on the producing properties and gathering facilities would be precisely the same as in the present case. Since there is no provision in the Act which would require the Commission to value the gas at the price urged by Canadian, the problem on review would be whether the end result was unjust and unreasonable. The point is that whatever method for rate-making is taken the fixing of rates affects the value of the underlying property. Hence § 1(b) could be read as petitioners read it only if Congress had put a floor under producing properties and gathering facilities and fixed a minimum return on them.

These considerations lead us to conclude that § 1(b) does not prevent the Commission from taking into account the production properties and gathering facilities of natural gas companies when it fixes their rates.

Original Cost of Production and Gathering Facilities. The Commission found the actual legitimate cost of Canadian's property, including its producing properties and gathering facilities, to be $10,784,464 as of December 31, 1939. It deducted $2,134,629 for accrued depreciation and depletion. It added $150,738 for working capital and $571,923 for gross plant additions to December 31, 1941. The result was a rate base of $9,372,496 which the Commission rounded to $9,375,000. The Commission rejected estimates of reproduction cost new less observed depreciation because they were "too conjectural to have probative value"[10] and adopted original cost as "the best and only reliable evidence as to property values." 43 P. U. R. (N. S.) pp. 213, 214. Canadian maintain that if its leaseholds are to be included in the rate-base, it was improper to value them as the Commission did. Canadian offered evidence that their present market value was much higher. It also offered evidence of a commodity market value of natural gas per Mcf which would give a much higher value to the production phase of Canadian's business. We do not stop to develop the details of these lines of evidence. We cannot say that the Commission was under a duty to put the leaseholds into the rate-base at the valuation urged by Canadian unless we revise what we said in *Federal Power Commission* v. *Natural Gas Pipeline Co.*, 315 U. S. 575, 586, and overrule *Federal Power Commission* v. *Hope Natural Gas Co.*, *supra*. We held in those cases that the Commission was not bound to the use of any single formula in determining rates. And in the *Hope Natural Gas Co.* case we sustained a rate order based on actual legitimate cost against an insistent claim that the producing properties should be given a valuation which reflected the market price of the gas. In those cases we held that the question for the courts when a rate order is challenged is whether the order viewed in its entirety and measured by its end results meets the requirements of the Act. That is not a standard so vague and devoid of meaning as to render judicial review a perfunctory process. It is a standard of finance resting on stubborn facts.[11] "From the investor or company point of view it is important that there be enough revenue not only for operating expenses but also for the capital costs of the business. These include service on the debt and dividends on the stock. Cf. *Chicago & Grand Trunk Ry. Co.* v. *Wellman*, 143 U. S. 339, 345-346. By that standard the return to the equity owner should be com-

[11] Cf. the British standards described in Smith, The Control of Power Rates in the United States and England, 159 Annals, 101, 103, 104.

mensurate with returns on investments in other enterprises having corresponding risks. That return, moreover, should be sufficient to assure confidence in the financial integrity of the enterprise, so as to maintain its credit and to attract capital. See *Missouri ex rel. Southwestern Bell Tel. Co.* v. *Public Service Commission*, 262 U. S. 276, 291 (Mr. Justice Brandeis concurring)." *Federal Power Commission* v. *Hope Natural Gas Co.*, *supra*, p. 603.

Hence, we cannot say as a matter of law that the Commission erred in including the production properties in the rate base at actual legitimate cost. That could be determined only on consideration of the end result of the rate order, a question not here under the limited review granted the case.

Cost to Canadian's Affiliate. As we have seen, Canadian and Colorado Interstate had their origin in an agreement made in 1927 between Southwestern, Standard, and Cities Service. Pursuant to that agreement Southwestern organized Canadian, a wholly owned subsidiary, to which were transferred the gas leaseholds and producing property owned by Amarillo, a wholly owned subsidiary of Southwestern. The cash consideration for this transfer was $5,000,000 which was advanced by Standard at 6 per cent interest. Colorado Interstate was organized by Standard to construct and operate the pipeline to connect with Canadian's facilities and to transport the gas to the Denver market and intermediate points.

Canadian issued $11,000,000 of 6% twenty-year bonds to finance its portion of the total project. Colorado Interstate purchased those bonds with part of the proceeds of $19,200,000 of its own 6% twenty-year sinking fund bonds which Standard had purchased at par. Canadian repaid the $5,000,000 advance made by Standard out of the proceeds of the sale of its bonds to Colorado Interstate. Canadian's stock was issued to Southwestern and is carried on Canadian's books at $1.00. Canadian entered into a "cost" contract with Colorado Interstate whereby Canadian agreed to produce and sell gas to Colorado Interstate at "cost" for twenty years which might be extended by Colorado Interstate. Under the contract, "cost" included Canadian's operating expenses, interest at 6%, and amortization (in lieu of depreciation, depletion and retirements) of all of Canadian's indebtedness over the twenty-year period. It was also provided that Canadian's "cost" under the contract should be decreased by any profits which it might obtain from other sources including any local sales. Thus it was obvious that Canadian under this "cost"

contract would have no profits available for dividends on its stock.

But in accordance with the agreement Colorado Interstate issued $2,000,000 par value 6% preferred stock and 1,250,000 shares of no par common. Cities Services received 15% of the common stock. The rest of the common stock and all of the preferred was divided equally between Southwestern and Standard. The latter paid $2,000,000 in cash for its share of preferred and common. Southwestern received not only preferred and common stock, but also $5,000,000 in cash from the proceeds of the $11,000,000 of bonds which Canadian issued and which were to be amortized over twenty-years as part of the "cost" of gas sold to Colorado Interstate by Canadian.

Canadian contends that the Commission should have included $5,000,000 in the rate base for the gas leases and producing properties acquired from Amarillo. The original cost of the properties to Amarillo was $1,879,504. That is all the Commission allowed. It said, "Any treatment which would permit the capitalization of such amounts would open the door to the renewal of past practices of the utility industry when properties were traded between affiliated interests at inflated prices with the expectation that the public would foot the bill." 43 P. U. R. (N. S.) p. 215. We agree. Southwestern owned the producing properties at the beginning of the transaction through one subsidiary; it owned them at the end of the transaction through another subsidiary. As between Southwestern and its subsidiaries there was no more than an intercompany profit. If Amarillo rather than Canadian had entered the project, had sold a bond issue to Southwestern and with part of the proceeds paid off a $5,000,000 loan to Standard, certainly the amount of that payment would not be properly included in its rate base. We fail to see a difference in substance when another wholly owned subsidiary is utilized by Southwestern. The fact that the negotiations between Southwestern and Standard were at arm's length has no bearing on the present problem. The end result is that property has been transferred at a write-up from one of Southwestern's pockets to another. The impact on consumers of utility service of write-ups and inflation of capital assets through inter-company transactions or otherwise is obvious. The prevalence of the practice in the holding company field gave rise to an insistent demand for federal regulation. See S. Doc. No. 92, Pt. 84-A, 70th Cong., 1st Sess., Utility Corporations, Final Report of the Federal Trade

Commission (1936); Bonbright & Means, The Holding Company (1932), ch. VI; Barnes, The Economics of Public Utility Regulation (1942) pp. 95 *et seq.*

American T. & T. Co. v. *United States*, 299 U. S. 232, is not opposed to our position. It merely indicates a proper treatment for an intercompany transaction where in fact an additional investment is shown to exist.

Affirmed.

Mr. Justice ROBERTS and Mr. Justice REED dissent from so much of the opinion as approves the allocation by the Commission of investments and expenses to the non-regulable transmission properties. They concur in the dissent of the CHIEF JUSTICE in *Canadian River Gas Co.* v. *Federal Power Commission, et al.*

Mr. Justice JACKSON, concurring.

I concur in upholding orders of the Federal Power Commission in this and companion cases. The Court cannot, consistently with *Federal Power Commission* v. *Hope Natural Gas Co.*, 320 U. S. 591, do otherwise.

The opinion in the *Hope* case laid down fundamental principles of decision in this language: "Under the statutory standard of 'just and reasonable' it is the result reached not the method employed which is controlling. . . . It is not theory but the impact of the rate order which counts. If the total effect of the rate order cannot be said to be unjust and unreasonable, judicial inquiry under the Act is at an end. The fact that the method employed to reach that result may contain infirmities is not then important." *Federal Power Commission* v. *Hope Natural Gas Co., supra*, 602. This case introduced into judicial review of administrative action the philosophy that the end justifies the means. I had been taught to regard that as a questionable philosophy, so I dissented and still adhere to the dissent. But it is the law of this Court, and I do not understand that any majority is ready to reconsider it.

It is true that the Act excludes "production or gathering of natural gas" from jurisdiction of the Commission. If the Commission had imposed any direct regulation upon that activity, I would join in holding it to have exceeded its jurisdiction. But the orders in question have no immediate "impact" upon production or gathering of gas.

The statute commands the Commission to regulate the price of natural gas transported and sold at wholesale in interstate commerce

for resale. The Commission has investigated the fiscal aspects of production and gathering because of their bearing on the reasonableness of interstate rates. I suppose a commission is free to take evidence as to conditions and events quite beyond its regulatory jurisdiction where they are thought to affect the cost of that whose price it is directed to determine. This, as I see it, is all that has been done here.

Of course the Commission's order, whose primary impact is on rates in the interstate markets, has a very important secondary effect on production and on producers of gas. As the industry is organized the Commission could not fix an interstate price that would not have some such reaction. Indeed, I think the Commission cannot wisely fix a reasonable price without considering its incidental effect on production.

To let rate-base figures, compiled on any of the conventional theories of rate-making, govern a rate for natural gas seems to me little better than to draw figures out of a hat. These cases confirm and strengthen me in the view I stated in the *Hope* case that the entire rate-base method should be rejected in pricing natural gas, though it might be used to determine transportation costs. These cases vividly demonstrate the delirious results produced by the rate-base method. These orders in some instances result in three different prices for gas from the same well. The regulated company is a part owner, an unregulated company is a part owner, and the land owner has a royalty share of the production from certain wells. The regulated company buys all of the gas for its interstate business. It is allowed to pay as operating expenses an unregulated contract price for its co-owner's share and a different unregulated contract price for the royalty owner's share, but for its own share it is allowed substantially less than either. Any method of rate-making by which an identical product from a single well, going to the same consumers, has three prices depending on who owns it does not make sense to me.

These cases furnish another example of the capricious results of the rate-base method in this kind of case. The Commission has put five of the most important leaseholds, containing approximately 47,000 acres, in the rate base at $4,244.24, something under 10 cents per acre. Three such leases are put in the rate base at zero. This is because original cost was used, and these were bought before discovery of gas thereon. The Company which took the high risk of wildcat exploration is thus allowed a return of 6½ per cent on nothing for the three leases and a return of less than

$300 a year on the others. Their present market value is shown by testimony to be over 8 million dollars.

I cannot fairly say that the Commission exceeded its jurisdiction in obtaining this evidence and making these calculations, even though the evidence related to production and gathering of gas. But I do think it is a fantastic method of fixing a "just and reasonable" price for gas.[1] All of that, however, was thrashed out in the *Hope* case.

I do not recede from the views therein stated that *Hope* provides no workable basis of judicial review, no key by which commissions can anticipate what rule, if any, will control our review, and no guidance to counsel as to what issues they should try or how they should try them. I think, however, that the majority which promulgated that decision, or a majority of that majority, should be permitted to continue to spell out its application to specific problems until we see where it leads.

It is difficult for me in these cases, and in some it might be impossible, to follow the rule of *Hope* in reaching a decision. I have no intuitive knowledge as to whether a given price is reasonable, and my fundamental concept of reasonable price in this industry and how to find it has been rejected by the Court. But it happens that this case illustrates some aspects of the problem of pricing gas, as will appear from the reasons I shall state for the failure of the Company in this case to convince me that it is wronged by the reduction of prices ordered by the Commission.

Far-sighted gas-rate regulation will concern itself with the present and future, rather than with the past, as the rate-base formula does. It will take account of conditions and trends at the source of the supply being regulated. It will use price as a tool to bring goods to market—to obtain for the public service the needed amount of gas. Once a price is reached that will do that, there is no legal or economic reason to go higher; and any rate above one that will perform this function is unwarranted. If the supply comes from a region where there is such overproduction that owners are ready to sell for less than a fair return on their investment, there is no reason why the public should pay more. On the other hand, if the supply is not too plentiful and the price is

[1] It does not help me to know what is a reasonable price for gas to learn what it does to outstanding securities. Many gas companies were organized and operated in care-free days when they issued stocks and bonds without supervision. It does not prove that a gas rate is too low to show that it does not pay dividends on inflated values. Nor is a rate proved excessive by the fact that it pays a large dividend upon an exceedingly conservative capitalization. I think *Hope's* use of return on stock or bond issues, repeated in these cases, is one of the least reliable of possible tests of rates.

not a sufficient incentive to exploit it and fails to bring forth the quantity needed, the price is unwisely low, even if it does square perfectly with somebody's idea of return on a "rate base." The problem, of course, is to know what price level will be adequate to perform this economic function.

This case throws light on a subject which in *Hope* I was trying to discuss more abstractly. The evidence here shows facts from which we can learn, in the way any practical buyer would seek to learn, at which price this company is able, willing, and ready to bring gas into the interstate wholesale market. It is what might be called the most-favored-customer test, a test of course not available in a fully regulated industry but peculiarly adapted to the conditions of the natural gas industry as it has developed. This petitioner, Colorado Interstate Gas Company, sells to Colorado Fuel and Iron Company a large quantity of gas for industrial use. Its consumption approximates that of all the inhabitants of Denver. Colorado Fuel and Iron used in plants 7,257,379 m.c.f.'s, while Denver was supplied for public service 6,196,882 m.c.f.'s. The rates to the Fuel and Iron Company are not and never have been regulated by public authority. In May 1938, the Gas Company contracted to extend the Fuel and Iron supply contract for five years at 9½ cents per m.c.f. for boiler fuel and 16 cents per m.c.f. for other purposes. The same gas is sold wholesale by the same company at the Denver city gate to the local distributing company at 40 cents per m.c.f.

Of course differences in conditions of delivery must be allowed for. Gas from the field is transmitted roughly 200 miles from the field to Colorado Fuel and Iron and about another 100 miles to Denver. If 50 per cent more transportation added 50 per cent to the entire price of the Fuel and Iron Company gas, which would mean attributing a zero value to it in the field and its entire selling price to transportation, it would bring gas to the city gate of Denver at about 14 cents based on boiler gas and 24 cents based on other gas, instead of the 40 cents being charged.

Another difference must be allowed for. The Denver public service has priority over the industrial gas in time of shortage. This is an impressive, legal advantage, but one whose real worth depends on the number and duration of interruptions it causes in actual practice. From the tabulation of reductions and suspensions of service the Fuel and Iron Company appears to have suffered 5 interruptions from 1932 to December 31, 1940—the shortest for fifteen hours, the longest for fifty hours. I do not belittle these interruptions—they may be very costly to an in-

dustrial customer—but nothing indicates that they account for any such difference in price as we have here.

There is every indication that the Colorado Fuel and Iron price was really a bargained one. The Gas Company's position seems to have been the same as that stated by one of the witnesses in the Panhandle case, "It may be heresy to say so but we try to charge our nonregulated customers all the traffic will bear." This may have been candor; it is not heresy. Such is the normal spirit of the market place. But the record shows that Colorado Fuel and Iron was not at the mercy of the Gas Company, was bargaining at arm's length, had a good bargaining position. It had been using other fuels and the Gas Company had to bid for its business as against fuel competition. Under this pressure the Gas Company was able, ready, and willing to part with its gas, delivered 200 miles from the field, at 9½ to 16 cents per m.c.f.

What about the Denver rate? There the local distributing company, which was the purchaser, was a subsidiary of Cities Service, one of the three companies that owned the pipe line and gas supply and were the sellers of the gas. That local company had been distributing manufactured gas, by comparison with which 40-cent natural gas would look cheap, and is cheap. It is not necessary to draw any invidious inferences from intercorporate relationships to conclude that the 40-cent rate at the Denver gate was not a vigorously bargained one and was not much influenced by competitive considerations. The great economic advantages of natural gas to householders and the relative wastefulness of its industrial use are developed in my opinion in *Hope*.

I strongly suspect from the history of this transaction that there is an explanation of the difference in price—one which is not an uncommon argument used to justify a lower price to industrial than to household users. To supply Denver required laying a 20-inch pipe line, requires operating it, and requires most of the overhead of the business. To carry the additional Fuel and Iron business required only to lay the first 200 miles of pipe of 22-inch diameter instead of 20 and the additional revenue from industrial sales does not add the same proportion of capital investment, overhead, or operating expense. Thus, charging to Denver and other wholesale purchasers for resale to the public no more than would be charged if that service stood alone, the Company may justify its industrial sales at low rates as good business from petitioner's management point of view.

But I do not think it can be accepted as a principle of public regulation that industrial gas may have a free ride because the

pipe line and compressor have to operate anyway, any more than we can say that a big consumer should have a free ride for his coal because the trains run anyway. It is true that the Natural Gas Act forbids discrimination only as between regulated rates and does not forbid discriminations between the regulated and unregulated ones. 15 U. S. C. § 717c(b). But I do not think it precludes use of a voluntary, fairly bargained selling price as a standard of what is a "just and reasonable" price. By use of the unregulated price as a basis for comparison I think a reduction in the wholesale rates for resale to the public is in order. If this makes low price industrial business less desirable, it will be in the long-range public interest for reasons more fully stated by me in *Hope*.

I should like to reverse this case, not because I think the rate reduction is wrong, but because I think the real inwardness of the gas business as affects the future has been obscured by the Commission's preoccupation with bookkeeping and historical matter. Such considerations may be relevant to rate-base theories, but will not be very satisfying to a coming generation that will look back and judge our present regulatory method in the light of an exhausted and largely wasted gas supply. But as the matter stands I see no legal grounds for reversal.

No. 380

Mr. Chief Justice STONE, dissenting.

Mr. Justice ROBERTS, Mr. Justice REED, Mr. Justice FRANKFURTER and I are of opinion that the Federal Power Commission, in making the rate order here under attack, exceeded its jurisdiction and reached a result which must be rejected because unauthorized by the applicable statute.

In fixing rates for petitioner's interstate business of transporting and selling natural gas for resale, the Commission included petitioner's gas wells and gas gathering facilities together with all its transportation and distribution facilities in a single rate base. It valued the wells and gathering facilities at their prudent investment cost of many years ago, a valuation drastically less than their present market value. It then restricted petitioner's return to 6½% of the rate base, including the wells and production facilities, constituting approximately two-thirds of the total rate base. It thus subjected petitioner's production and gathering property to the same regulation as that which the statute imposes

upon petitioner's property used and useful in the interstate transportation and sale of gas for resale. This, we think, the Natural Gas Act in plain terms prohibits.

The Natural Gas Act of 1938, 52 Stat. 821, 15 U. S. C. § 717, *et seq.*, as amended February 7, 1942, 56 Stat. 83, declares, § 1(a): "the business of transporting and selling natural gas for ultimate distribution to the public is affected with a public interest, and . . . Federal regulation in matters relating to the transportation of natural gas and the sale thereof in interstate and foreign commerce is necessary in the public interest." In the execution of this policy §§ 4 and 5 of the Act set up a complete scheme of regulation of rates and charges for the transportation and sale of natural gas by "natural gas companies" at wholesale in interstate commerce. Section 2(6) defines a natural gas company as "a person engaged in the transportation of natural gas in interstate commerce, or the sale in interstate commerce of such gas for resale." Section 1(b) provides: "The provisions of this Act shall apply to the transportation of natural gas in interstate commerce, to the sale in interstate commerce of natural gas for resale . . . , but shall not apply to any other transportation or sale of natural gas . . . or to the production or gathering of natural gas."

The Court rejects petitioner's contentions that these provisions preclude the Commission from including the gas wells and gathering facilities in the rate base for petitioner's regulated business; that regulation begins only with the delivery of gas into petitioner's transmission pipe line and includes, as the statute provides, only the interstate transportation and sale of the gas for resale. Petitioner insists that, since the wells and gathering facilities are not subject to Commission regulation, the cost or value of the gas upon its delivery to petitioner's transmission line must, for purposes of rate regulation of the regulated business of transportation and sale, be taken at its fair market value.

This issue is now for the first time presented to this Court for decision. No such question was raised or decided in *Power Commission* v. *Hope Natural Gas Co.*, 320 U. S. 591, 610-614. Although it was mentioned in the amicus brief of the State of West Virginia, which was not a party to the suit, no such issue was raised by the parties in the case. There the gas wells and gathering property were included in the rate base valued at its prudent investment cost, and the allowed return was restricted to 6½%. But no objection was taken to the inclusion of the production property in the rate base, either in the Circuit Court of Appeals or, so far as the record shows, in the application to the Commission for rehearing. Section 19(b) provides that no

objection to the Commission's order may be considered by the court unless raised in the application to the Commission for rehearing. The production property having been included in the rate base without objection, we could consider only the question which was raised with respect to property admitted to be properly a part of the rate base, namely, whether its valuation by the Commission and the allowed rate of return were within constitutional limits. Cf. *Cohens* v. *Virginia*, 6 Wheat. 264, 399.

The Act speaks in terms of activities which are regulated and those which are not. It subjects the interstate transportation and sale of natural gas, an activity, to the jurisdiction of the Commission, which includes the exercise of its rate making function as prescribed by §§ 4 and 5, and which concededly extends to the valuation of property used in interstate transportation and sale of natural gas and to the determination of a fair rate of return upon that value.

Even though production and gathering could be thought to be a part of the regulated transportation and sale, that possibility is precluded by the words of § 1(b) which say: "The provisions of this Act [including those of §§ 4 and 5 which prescribe rate making for the activity of transporting and selling wholesale] shall not apply" to another activity, "the production or gathering of natural gas."

It does not seem possible to say in plainer or more unmistakable language that the one activity, interstate transportation and sale, is to be subjected to, and that the other, production or gathering, is to be excluded from, the valuation and rate making powers of the Commission. To interpret the words "production or gathering" in § 1(b) in the only way which the Court or the Government is able to suggest, as referring only to the physical activities of drilling and spacing the gas wells, and thus excluding such activities alone from regulation, seems hardly plausible. It is true that "production or gathering" are activities which may include the drilling and spacing of gas wells. But the "transportation and sale" referred to in the phrase of § 1(b) "but shall not apply to any other transportation or sale of natural gas . . . or to the production or gathering of natural gas", is also an activity. Yet the Court and the Government concede that by the command of the Act that it "shall not apply" to the activity of "any other transportation or sale", petitioner's property used in the transportation and sale of gas to industrial consumers is excluded from the rate base. They thus reach the surprising conclusion that property used in one sort of activity to which the

provisions of the Act are declared not to apply, may nevertheless be included in the rate base, while holding that another sort of property, also used in an activity to which the provisions of the Act are by the same phrase declared not to apply, is nevertheless excluded from the rate base.

Nor is the plausibility of the Government's construction aided by reference to the provisions of the Act[1] giving the Commission power to make investigations, to regulate accounts, to gather information and to find values of property of natural gas companies and their depreciation. These provisions are obviously directed at aiding the Commission in the exercise of various powers which are conferred upon it but which are unrelated to the regulation of the production or gathering of natural gas. Section 5(b), for example, authorizes the Commission to procure the information of costs of production or transportation of natural gas in aid of state commissions, and such was its purpose. H. Rep. No. 709, p. 5, 75th Cong., 1st Sess., on H. R. 6586. Sections 9(a) and 10(a) give authority essential to the Commission's admitted power to regulate the interstate sale of gas at wholesale, to determine whether the cost of or charge for the gas acquired by a natural gas company, whose rates are regulated, are excessive because unrelated to fair or market value, especially where the relations between the producer and the interstate wholesale distributor are not at arm's length. *United Fuel Gas Co.* v. *Railroad Commission*, 278 U. S. 300, 320; *Smith* v. *Illinois Bell Tel. Co.*, 282 U. S. 133, 144; *Western Distributing Co.* v. *Public Service Comm'n*, 285 U. S. 119; *Dayton Power & L. Co.* v. *Public Utilities Comm'n*, 292 U. S. 290; *Natural Gas Co.* v. *Slattery*, 302 U. S. 300, 306-308; *Arkansas Gas Co.* v. *Dept.*, 304 U. S. 61; cf. *Int. Com. Comm'n* v. *Goodrich Transit Co.*, 224 U. S. 194, 211. And the determination of the Commission permitted by § 14(a) with respect to the amount of gas reserve is essential to the determination of the rate of depreciation and amortization of the

[1] Section 5(b) authorizes investigation by the Commission of the cost of production of natural gas, where the Commission has no authority to establish a rate governing the transportation or sale of such natural gas. Section 6(a) empowers the Commission to ascertain the cost of the property of every natural gas company and other facts bearing on the determination of such cost "when found necessary for rate making purposes". Section 9(a) authorizes the Commission to determine the proper "rates of depreciation and amortization" of the several classes of property of each natural gas company "used or useful in the production, transportation, or sale of natural gas". Section 10(a) gives the Commission authority to require reports from natural gas companies of their "cost of maintenance and operation of facilities for the production" of natural gas. Section 14(a) gives the Commission power to determine the "adequacy or inadequacy of the gas reserves held or controlled" by them.

gas company's regulated transmission line, since its useful life is normally limited by the available gas supply.

No reason, founded upon the language of the statute or its purpose, is advanced for disregarding the plain command of § 1(b) excluding the production or gathering of the gas from those other activities, the transporting and selling, which are subject to the regulatory provisions of §§ 4 and 5. The language was well chosen to accomplish exactly what the legislative history shows was intended to be accomplished. The report of the House Committee (H. Rep. No. 709, 75th Cong., 1st Sess.), recommending adoption of the bill which became the Natural Gas Act, shows beyond doubt that the purpose of the legislation was to bring under federal regulatory control the interstate transportation and sale of natural gas which had been held not to be subject to state regulation, in *Missouri* v. *Kansas Gas Co.*, 265 U. S. 298; cf. *Public Util. Commission* v. *Attleboro Steam & Electric Co.*, 273 U. S. 83, but to leave undisturbed all other matters which were then subject to state regulation, which included rate-making for production and gathering. See *Illinois Natural Gas Co.* v. *Central Illinois Public Service Co.*, 314 U. S. 498, 506; *Power Commission* v. *Hope Natural Gas Co.*, *supra*, 609. And upon the floor of the Senate the sponsor of the bill declared: "It does not attempt to regulate the production of natural gas or the distributors of natural gas; only those who sell it wholesale in interstate commerce." 81 Cong. Rec., p. 9312. That the exemption of the production of natural gas from regulation was thought by the regulatory authorities themselves to exclude regulation, by the Commission, of the price of gas in the producing field, appears from the hearings upon the predecessor bill,[2] which contained provisions identical with or substantially equivalent to §§ 5(b), 6(a), 9(a), and 10(a) of the Act as finally passed, and § 1(b) of which declared that the

[2] In the hearings upon the earlier bill, Mr. DeVane, Solicitor of the Federal Power Commission, stated: "§ 1(b) also provides that the Commission shall have no jurisdiction over the gathering or gathering rates for natural gas". "Gathering rates", he explained as "The rates that are paid in the gathering field". He further stated, "There is no control of the gathering rate; the Commission would not have jurisdiction. That price is fixed by competitive conditions that exist in the field". He said that the Commission does not have any power over the price "that is paid to the gatherer, the man that produces it; that is binding if the transaction is at arm's length. If the transaction is not at arm's length, of course, its reasonableness may be inquired into, under the decisions of the Supreme Court." There is nothing in the subsequent legislative history to indicate that this understanding with respect to § 1(b) in the earlier Act was changed at a later stage, and § 1(b) as finally adopted indicates no such change. Hearings on H. R. 11662, 74th Cong., 2d Sess., pp. 28, 42-3.

provisions of the bill should not apply "to the production of natural gas."

The exclusion of production and gathering of natural gas from the regulatory authority of the Commission is a command to the Commission not to regulate that which is excluded. Otherwise powers reserved to the states would be encroached upon contrary to the words and purpose of the Act, and a pretended government would be set up by Commission action, without the authority of Congress.

The Commission did not deny the command, but justified disregard of it only by saying that "Canadian's production and gathering operations are an integral part of its total operations, including transportation in interstate commerce and the sale of natural gas for resale in interstate commerce." And it added: "The investigation of Canadian's production and gathering property and operations is indispensable in regulating Canadian's rates and charges for the sale of natural gas in interstate commerce for resale." Such an investigation was undoubtedly proper and necessary in order to ascertain the fair unregulated value of the natural gas produced in an unregulated field, on its delivery into petitioner's transmission pipe line, in order to enable the Commission to regulate appropriately the sales price of the gas.

But this does not mean that in fixing rates for a regulated business which derives its distributed product from an unregulated business that the property of the latter is not to be segregated from the regulated property, or that there can rightly be applied to it standards of valuation and rate of return which are applicable only to a regulated business. *Int. Com. Comm'n* v. *Goodrich Transit Co., supra*, 211; *Smith* v. *Illinois Bell Tel. Co., supra*, 151; *Western Distributing Co.* v. *Public Service Comm'n, supra*, 123-124. Otherwise its exclusion from regulation would be meaningless. The standards to be applied in order to make certain that the regulated business is not paying too much for the product are those which currently apply in the unregulated business. This, as we have pointed out, was recognized by the Solicitor of the Commission in the hearings on proposed legislation culminating in the present Act. He said that the unregulated field price was controlling upon the Commission "if the transaction is at arm's length. If the transaction is not at arm's length, of course, its reasonableness may be inquired into, under the decisions of the Supreme Court."[3]

[3] See footnote 2, *supra*.

It is one thing to say that such investigation is necessary to ascertain the fair unregulated value of petitioner's gas when produced. But it is quite another to say, and the Commission did not say, that it is necessary or permissible for the Commission to fix the value of petitioner's production property and the gas which it produces far below their market value, and to restrict petitioner's return from its unregulated business below that which would be produced if the gas production were unregulated. Such restrictions can be justified only by authorized rate regulation. From such regulation petitioner's gas wells and production facilities have been specifically exempted by command of the statute.

Where a regulated utility procures from an unregulated source the product which it distributes, the proper cost which the regulated company should be allowed to pay for it, when the Commission is not authorized to regulate the production, presents a problem not free from difficulties. But here the Commission has made no effort to meet these difficulties, if such there be, except by the one course which the statute forbids, by subjecting the production property to regulation.

A familiar and permissable way of meeting them, as petitioner points out, is by treating the property unregulable in law as unregulable in fact, and applying to it those standards of value and return which currently prevail in an unregulated business when it is conducted at arm's length. Petitioner urges that there are other courses open to the Commission which will not violate the statute, and that there is uncontradicted evidence in the record showing that natural gas has a market value at the wellhead and at the point of delivery into petitioner's transmission line. Those conditions would indicate that gas production property in the area in question has an ascertainable market value on which, in the absence of regulation, petitioner is free to receive the return currently produced by such property.

Without an appropriate investigation we cannot know the fact, which is for the Commission and not for us to determine. If investigation discloses difficulties which only legislation can cope with, the answer is further legislation, not disregard of existing legislation. But the Commission has made no such determination or investigation and, so far as appears, has given no consideration to the evidence supporting petitioner's contentions. It is the duty of the Commission so to conduct its proceedings as to restrict its action within the jurisdiction conferred upon it. It is plain that it

has not performed that duty here, and that it should be required to do so. Whether the facilities for the production of natural gas should be regulated and, if so, whether the regulation should be left to the states, as we think Congress has left it, are matters for Congress to determine. If it be thought that petitioner's profits from production of gas are too great because they are unregulated, and if it be thought to be important that they be reduced, it is immensely more important that that be not accomplished by lawless action.

It is no answer to cite our authorities involving state regulation,[4] in order to prove that the Commission here has acted within its statutory authority. In reviewing such cases we accept the state's construction of its statutes fixing the jurisdiction of state regulatory bodies. Nor is it any justification of the Commission's action to say, applying the *Hope* case, that the end result of the Commission's action is that petitioner's unregulated property is not being confiscated. Authorized utility regulation may, of course, result in a permissible diminution of property values and income, provided the regulation does not so exceed constitutional limitations as to be "confiscatory". Hence, loss or damage caused by authorized utility regulation gives rise to no actionable wrong if the regulation is within constitutional limitations. Such was the principle laid down in the *Hope* case.

But any such diminution in value or return, caused by unauthorized regulation, is unlawful without reference to constitutional principles. In the *Hope* case there was no contention that the utility's production property was not subject to regulation. The only question was whether the return upon it, as allowed by statutory authority, was confiscatory because it went beyond the constitutional limits of the power to regulate. Here the question is only of the deprivation of petitioner's property by the Commission's action in excess of its statutory power to regulate. That power, in the case of petitioner's production property, we think does not exist. So far as the unauthorized regulation deprives petitioner of its property, the deprivation cannot be justified by saying that, if authorized, it would not violate the Constitution. Absence of confiscation by authorized Commission regulation does not prove that the Commission has legislative authority to regulate.
